William Grocyn was a cleric and a humanist educated in Oxford, where he was elected Divinity Reader at Magdalen College in 1483. Later he held important positions as canon, prebendary, and rector throughout Britain; his most important appointments were to the vicarship of St Lawrence Jewry in London (1496–1517) and to the mastership of All Saints' College, Maidstone (1506–1519). From 1488 to at least 1490, he was in Italy along with Thomas Linacre, studying Greek and Latin in Florence under Angelo Poliziano and Demetrius Chalcondylas. He was in contact with Aldus Manutius, as it is testified by a letter addressed to the publisher, which is Grocyn's only extant work. His known associates include Desiderius Erasmus Rotterdamus, John Colet, and Thomas More. Grocyn owned a remarkable library of manuscripts and printed books: it contained works by ancient Latin and Greek authors, contemporary authors, and Italian humanists. Grocyn's Greek collection, mostly in the manuscript

form and partly of Italian provenance, was the best in Britain: the scribes of some of his *codices* were Joannes Serbopoulos, Emanuel of Constantinople, Joannes Thessalus Scutariota, and Petros Hypsilas. Most of these books are now kept at Corpus Christi College, Oxford.

Biography

William Grocyn, cleric and humanist, was born in the middle of the fifteenth century (*c.* 1446: Burrows 1890, 335; *c.* 1449: Lily 1548, fol. 48v) in Colerne (Wiltshire), where his father was a college tenant. He was educated at Winchester College starting from September 1463. He was admitted to New College, Oxford, in 1465 as a scholar and was subsequently elected fellow in 1467. He was the tutor of William Warham, who would later become the Archbishop of Canterbury. It is believed that Grocyn became Master of Arts by 1474, while it is thought that he could have taught for Lincoln College in 1477. He was elected Divinity Reader at Magdalen College, Oxford, in 1483, when he successfully opposed Master John Taylor in a disputation held during Richard III's visit. In March 1488, however, he vacated this readership and went to Italy. He returned to Oxford by 4 June 1491 (Weiss 2010, 262 and nn. 35–36); it is now presumed that he privately taught the humanities rather than giving the first Greek public lectures at the university, as it has been commonly postulated (Clough 1977, 22 n. 5; Clough 2000, 106). While Grocyn held important positions as canon, prebendary, and rector throughout Britain, his most important appointments were to the vicarship of St Lawrence Jewry in London (from December 1496 until his resignation in May 1517) and to the mastership of All Saints' (or All Hallows')

College, Maidstone, Kent (from April 1506 until his death). He was disabled by an attack of paralysis in 1518 and died between 2 June and October 1519, after which he was ultimately laid to rest in All Saints' (Emden 1958, 827).

The Italian Trip

In *c.* 1488 Grocyn left Oxford for Italy, where he was said to have studied Greek and Latin in depth. It is not excluded that he had improved on the knowledge of Greek that he had previously acquired in Britain, possibly with the assistance of Cornelio Vitelli, who was *praelector* of New College for 2 years from about January 1485 (Clough 2000, 99), or the Greek scholars and copyists Emanuel of Constantinople and John Serbopoulos (Catto 1992, 780–781). In the dedicatory epistle to Marcus Musurus of a treatise on Greek orthography in Statius' edition, Aldus Manutius remembered that Grocyn, along with Thomas Linacre, had studied Greek in Florence under Demetrius Chalcondylas (Manutius 1502, fol. aiv). Grocyn personally came into contact with Manutius: he addressed a letter to the printer, dated in London on 27 August, plausibly in the year 1499 (Allen 1903, 515), where he thanked him for his extraordinary kindness to Linacre, who had taken part in the work on the Greek Aldine edition of Aristotle in five volumes, which were published between 1495 and 1498. This epistle prefaces Linacre's Latin translation of ps. Proclus' *De sphaera* in the edition of *Astronomici veteres*. Grocyn recalled Linacre's collaboration with Aldus and praised the publisher both for printing in Greek and for releasing an edition of Aristotle instead of Plato. Grocyn presented himself as being pleased to know from Linacre that Aldus was contemplating the printing of the Old Testament in Latin, Greek, and Hebrew, and of the New Testament in Greek and Latin, urging him to carry on (Grocyn 1499, fols Tiv-Tiir). This epistle is Grocyn's only published work. A tradition connects the names of Linacre, Grocyn, and William Latimer (*c.* 1467–1545) with a project for a joint translation of Aristotle

into Latin. However, except for the translation of the *Meteorologica* in which Linacre seems to have been engaged (Manutius 1499, fol. Tiv), there is no evidence to show that the work was ever seriously undertaken. In a letter to Erasmus, datable to 30 January 1517, Latimer stated that Grocyn and Linacre had studied under Chalcondylas and Angelo Poliziano, the former for a couple of years and the latter for the same amount of time or even longer (Erasmus Roterdamus 1910, 441–442). Latimer's testimony seems to be reliable, at least for Linacre: Latimer had met Linacre in Padua in c. 1498 and had befriended him. Moreover, he was writing while Linacre was still alive. The letter appears in the collection of Erasmus' letters published by Froben (Basel, 1519) and it is not impossible that this was the source for the same statement by the cleric and cosmographer Georgy Lily (†1559), who dedicated a paragraph to both Grocyn and Linacre in his *elogia* of highly distinguished British intellectuals. Lily wrote that Grocyn devoted considerable efforts to Greek and Latin with Chalcondylas and Poliziano after he had learnt the rudiments of these languages in Britain (Lily 1548, fol. 48r). Lily could have also gained insight as to the education of these scholars from his father William (c. 1462–1522/3), who was the godson of Grocyn and was admitted with Linacre to the English Hospice of St Thomas of Canterbury in Rome on 4 November 1490 (Schmitt 1977, 40). Latimer did not discuss the date of Linacre and Grocyn's Italian trip. An autograph note by Poliziano in an incunabulum (now kept in Oxford) testifies that in 1490 Poliziano held a 7-month-long private course on Pliny the Elder for English and Portuguese pupils (Cotton 1937, 394–397). According to sources, even if they are not explicitly mentioned, the English students were Linacre, whose presence at Florence at the end of 1489 can be proved by John Morer's will (Bennet 1968, 90), and Grocyn.

Grocyn's European Network

Visiting England for the first time in 1499, Erasmus found that Grocyn associated with John Colet

and Thomas More. His name, with those of Colet, More, Polydore Vergil, and others, is recorded in the admissions book of Doctors' Commons in London (1508; Logan 1988, 156). In two epistles of c. 1501 and 1504 More defined Grocyn as a tutor and a master (Rogers 1947, 4; 8–9). In the letter datable to 1501 and addressed to John Holt, More related that Grocyn began a lecture series in St Paul's Cathedral in London on the book *De celesti hierarchia* of ps. Dionysius the Areopagite. According to Erasmus, Grocyn initially believed that the author of the work was St Paul's convert (Act. 17:34), but subsequently changed his original opinion (Trapp 1996, 298–302). In the letter datable to 1504 and addressed to Colet, More referred to Grocyn as the sole guide in his life in Colet's absence. More delivered a series of lectures on St Augustine's *De civitate Dei* (whose text does not survive) in Grocyn's church of St Lawrence Jewry (Burrows 1890, 356–357). In a letter from Antwerp to German de Brie, dated 25 June 1520, Erasmus wrote that More had learnt Greek thanks to the teaching of Linacre and Grocyn (Erasmus Roterdamus 1922, 294). Praises of Grocyn are frequent in Erasmus' letters to Aldus, Germain de Brie, Guillaume Budé, Colet, John and Robert Fisher, Latimer, Linacre, Richard Pace, Joost Vroye (Gaverius), and Roger Wentford. At the end of his life, Grocyn was appointed to All Saints' College, Maidstone, where he died in 1519. On 2 June of that year he made his will, which was executed by his executor and residuary legatee Linacre on 20 July 1522 (Burrows 1890, 380).

Works

Grocyn is said to have written: *Tractatus contra hostiolum Jo. Wyclevi* (Wycliffe), *Epistolae ad Erasmum et alios*, *Grammatica*, *Vulgaria puerorum*, *Not. in Terentium*, *Isagogicum quoddam*, and *Epigrammata* (Wood 1813, 31). Although a tradition dating back to Bale's *De scriptoribus Britannicis* attributes a Latin epigram on Julia – who threw a snowball at her lover – to him (Fuller 1811, 297), the poem comes from the *Anthologia Latina* (Riese 1906, 173 nr. 706: a

longer version with some different readings; Hunt 1980, 106). With the exception of the previously cited letter to Aldus, none of his other works appear to have survived to the present day.

Grocyn's Library

Grocyn owned a remarkable library of manuscripts and printed books, reconstructible partly from an inventory made in 1520 by his executor Linacre after his death (Burrows 1890, 321–324; Allen and Garrod 1928, 47 pl. XXVI; Emden 1958, 828–830; Thomson 2015, 522–572, UO25-UO32). St Augustine appears to have been Grocyn's favorite author. Of the Early Fathers, he possessed works by Ambrose, Cyprian, Eusebius, Gregory the Great, and Jerome; writings from the medieval period include Anselm, Thomas Aquinas, Bonaventura, Duns Scotus, Nicholas of Lyra, and William of Ockham. There were also ancient Latin authors on the list, like Apuleius, Aulus Gellius, Caesar, Cicero, Lucretius, Juvenal, Seneca, Persius, Plautus, Pliny the Elder, Suetonius, Tacitus, Livy, Valerius Maximus, and Virgil. One can also find several works of Italian humanists: Ermolao Barbaro, Giovanni Boccaccio, Pietro Crinito, Marsilio Ficino, Francesco Filelfo, Pomponio Leto, Francesco Petrarca, Niccolò Perotti, Enea Silvio Piccolomini, and Lorenzo Valla. Moreover, Erasmus' printed bilingual New Testament and *Adagia* are both listed in the inventory. Grocyn's Greek collection, mostly in the manuscript form and partly of Italian provenance, was the best in Britain: it contained Aristotle (in Greek and in the Latin translations by Gaza and Argyropoulos), St Basil, much St John Chrysostom, ps. Dionysius (also in Latin), Eustrathius, Origen, Plato, Plotinus, Plutarch, Julius Pollux and the Greek lexicon "Suidas," Porphyrius, Proclus, Ptolemy, Simplicius, Theophylact, and Thucydides. The copyists of some manuscripts were the Greek scribes Joannes Serbopoulos (who produced two of them at Reading Abbey in 1495 and 1499), Emanuel of Constantinople, Joannes Thessalus Scutariota, and Petros Hypsilas. Most of these books are now at Corpus Christi College, Oxford.

Some were bought by the College upon the request of its first president, John Claymond; others were received by bequest from him (Coxe 1852 pars II; Thomson 2011; Wilson 2011). One manuscript is now at New College (Coxe 1852 pars I, 93 nr. CCLXI) and one in Liverpool (Clough 1983; Kristeller 1989, 51a).

Innovative and Original Aspects

Despite Grocyn's seemingly conservative leanings in religion and philosophy, his achievements in Greek and Latin, the importance of his European network, and the wealth of his library make him one of the most significant of the earliest Tudor humanists.

Grote, Geert

Born: October 1340

Died: 20 August 1384

Rijcklof Hofman

Titus Brandsma Instituut, Radboud University, Nijmegen, The Netherlands

Abstract

Geert Grote was the founder of the late medieval religious reform movement *Devotio moderna*. He lived in the second half of the fourteenth century and was known especially for his criticism of the higher clergy and his preaching activities which incited his audiences to lead a more sincere religious life. Through the three branches of followers together forming the *Devotio moderna*, he paved the way for a more critical approach to practices in the church during the later Middle Ages and beyond.

Alternate Names

Gerardus Magnus; Groote, Geert

Biography

Geert Grote was born in Deventer, a city in the present-day Netherlands, as the son of a wealthy and influential cloth merchant. At the age of 15, he was sent for further study to the University of Paris, where he was accorded the degree of *magister artium* in 1358. He spent several years in Paris thereafter, but eventually he returned, in or around 1366, to his native city. His attempts to secure a career in the church resulted in the assignment of prebendaryships in Aachen (1368) and Utrecht (1371) (cfr on his career before his conversion Magnus 2016: 38–49). Traditionally, it is maintained on the authority of his biographers that he gave up his active life in the world after a grave illness, probably in 1374, but perhaps somewhat earlier, which led to a conversion to an ascetic and spiritually oriented life, imitating Christ and his first followers. In order to interiorize this new attitude, Grote spent an unspecified period of time (probably 3 years) between 1374 and 1379 in Monnikhuizen, a Carthusian monastery near Arnhem, as a commensal. Grote's biographers also maintain that he started to show a sincere interest in spiritually oriented literature in Monnikhuizen for the first time (Épiney 1970: 36–50; Van Zijl 1963: 72–154), but in fact he was *leg.* acquainted with this sort of literature much earlier already (Hofman 2003). On the advice of the Carthusians, however, he exchanged the secluded life in the charterhouse for a life of preaching in the world, attested from c. 1379 until his death as a victim of the plague on 20 August 1384.

Innovative Aspects

In his sermons, but also in treatises and *consilia*, he summoned his contemporaries, apparently with much success, to give up their secular lifestyle and to start a devout life imitating Christ and his first followers. In addition, he attempted to improve the moral standards of contemporary clergymen. His efforts in this field came down to opposition against two forms of abuse in the

world of the clergy, corruption and incontinence. His views on corrupt practices in ecclesiastical positions can be subdivided in a few closely related topics: firstly, corrupt practices in connection with the acquisition of and functioning in ecclesiastical offices, and, secondly, the widespread custom to require an admission fee from prospective residents in religious institutions. Together with corrupt ordination, these evils were in Grote's days generally together referred to as different forms of simony. Closely related to simoniacal practices in relation with monastic entry is a tolerant attitude toward personal possessions belonging to individual residents in religiously living communities, a custom known as proprietarism (Magnus 2016). He aired his views on priests who shared their life and house with a member of the weaker vessel most convincingly during a sermon delivered during a diocesan synodal assembly, held on 14 August 1383 in Utrecht, the cathedral city of the medieval diocese of the northern Low Countries. He worked out the sermon after its delivery in several treatises varying in length (Magnus 2011). Reactions on the sermon were bound to be vehement. Many focarists (i.e., ordained clerics living together with female partners), among them various high-placed secular canons and prelates who accommodated concubines in their houses, were less than happy with Grote's sermon, as he must have realized in advance. And yet he was taken by surprise when headstrong focarists joined forces with various other groups of his antagonists. In the autumn of 1383, this group of combined opponents presented a formal petition to Floris van Wevelinckhoven, the Bishop of Utrecht (1379–1393) (Magnus 2011: 103–123; Van Zijl 1963: 297–302).

Until then Bishop Floris had supported Grote's efforts to reform abuses in the church, but under pressure he gave in to the opposition. Rather than directly confronting Grote by warning him personally, he preferred a more roundabout course, which may reflect his embarrassment in thwarting his former ally: he issued a decree reserving the permission to preach for priests, taking it away from deacons. Effectively, Grote, who was a

deacon, was forbidden to preach as a result. Less than a year later, on 20 August 1384, Grote died as a victim of the plague.

Impact and Legacy

Alternating with his preaching activities were periods of study and isolation. The single most important and lasting innovation which he carried out in this context is the composition of a book of hours written in vernacular Middle Dutch (Van Wijk 1940). This prayer book was immensely influential since it enabled lay people, most of them women, to develop and keep up their own spirituality without interference from church officials. He spent these periods most often in two rooms in his own house, which he had handed over to the city government shortly after his conversion, in order to accommodate single or widowed women in it. Shortly afterward, this community of women evolved into the Sisters of the Common Life, *leg.* groups of women living a religious life together without taking vows. In close cooperation with his friend and ally Florens Radewijns (1350–1400), a similar lifestyle for men was established in the 1380s, the Brothers of the Common Life. Both forms of religious common life without vows soon spread over Western Europe (Van Engen 2008; Klausmann 2003), while at the same time two other forms of more traditionally monastic life also adopted the principles of an observant, sincere religious lifestyle: Windesheim Regular Canons of St Augustine (Kohl et al. 1976–1984) and regular communities following the Rule of the Third Order of St. Francis (Van Engen 2006).

Grotius, Hugo

Birth: 10 April 1583

Death: 28 August 1645

Patrick Brugh

Loyola University of Maryland, Baltimore, MD, USA

Abstract

Hugo Grotius (1583–1645) was a Dutch jurist, humanist, and theologian, whose work resonated with and inspired the political and intellectual issues of his time. Born to a family with a history of local governance and academic excellence, Grotius pushed beyond his family's local political influence to become a diplomat, lawyer, and public intellectual of international prominence. Against the backdrop of escalating political tensions throughout Europe between parties such as Spain and the Netherlands, Sweden and the Holy Roman Empire, as well as France and England, Grotius's writings in law and theology engaged with and broke new ground in debates that would influence the outcome of several political conflicts, from the Dutch Revolt against Spain to the Thirty Years' War. At the same time, Grotius's humanistic writings, especially his translations and philological works, are not to be overlooked for their scholarly and aesthetic contributions to European cultural history. This article narrates Grotius's life and then examines some of his key interventions and legacy in the disciplines of philology, international law, and theology.

Biography

Hugo Grotius (Hugo de Groot, 1583–1645) was born in Delft, Netherlands, to Johan de Groot and

Alida van Overschie on April 10, 1583. He was the first-born son of a patrician family, whose male heirs frequently occupied the mayoral office of that town. His great grandfather, Corneille de Cornets, linked Hugo to a noble Burgundian bloodline, but Corneille surrendered his own namesake to the family name de Groot in a marriage contract to the daughter of the Delft mayor Diederich de Groot at the turn of the century. Hugo Grotius's grandfather, the son of Corneille de Cornets and also named Hugo, was both an exemplary scholar and notable mayor. His sons, Corneille and Johann, followed their father's legacy of superior academic performance. Corneille de Groot (Hugo Grotius's uncle) studied Greek literature and philosophy and later pursued studies in law and took a professorship in jurisprudence at the University of Leyden. Johann de Groot (Hugo Grotius's father) – like his brother and father – excelled at the university. Johann studied at Leyden under Justus Lipsius (1547–1606), absolved a doctorate in law, and then returned to the family business of running the town of Delft while helping to manage the affairs of the University of Leyden, where his brother was a professor.

In his academic training, Hugo Grotius (most often referred to by his Latin *nom de plume*) successfully upheld his family's tradition of exemplary performance in humanistic and in legal studies. The oldest of four children, Grotius attended the University of Leyden at the age of 12 where he studied under the famous scholar Joseph Justus Scaliger (1540–1609), who had succeeded Lipsius at the university. He soon took an opportunity to travel abroad and continue his studies internationally. On this celebrated trip to France, he socialized among some of the most powerful aristocrats and politicians of that country, including – according to his letters – “touching” the hand of the king. Grotius completed his doctoral studies in civil and canon law at the University of Orleans in 1598.

Grotius had by this time already distinguished himself at home and abroad as a learned individual and gifted new Latin poet. Most of his poems, which are celebrated primarily for their themes and his astonishing breadth of references to Roman writers, were frequently dedicated in deep gratitude to his father and often to important

noble houses, princes, diplomats, and military commanders in Europe as well. Notably, his poetic rendering of several psalms and his tragedy *Adamus exul* (1601) became inspirational material for John Milton (1608–1674). In 1617, his younger brother Wilhelm de Groot published a significant collection of his poetry written between 1591 and 1617, but by that point his legal reputation had begun to overshadow his literary and philological output. His works as a mature adult, such as *Christus patiens* (1608) and his reworking of the story of Joseph and his brothers *Sophompaneas* (1632, publ. 1635), won acclaim in addition to his many translations of Greek and Roman authors.

In 1601, at the age of 16, Grotius began his legal career as a lawyer for Holland, Zeeland, and Frisia, based out of the Hague. The political situation in his home country, especially the ongoing conflict in the early 1600s between Spanish and Dutch trade interests, drew his attention away from some of his academic projects to the more practical concerns of diplomacy and law. He was appointed as a public prosecutor under the authority of the Dutch Republic leader Johan van Oldenbarnevelt (1547–1619) to the province of Holland in 1607 and later as a pensionary, or legal officer, of Rotterdam in 1613. Grotius was a productive legal contributor during the peace talks between Spain and the United Provinces, which began in 1607. In 1608 these talks fell apart over the Spanish demand, in return for a Spanish recognition of Dutch independence, that the Netherlands cease trading in India. With the help of France and England, however, a fragile 12-year truce had been reached in early April of 1609. By then, Grotius had written several important memoranda, one of which was commissioned by the United Dutch East India Company (VOC) and subsequently published as the source for two anonymous pamphlets in support of the Dutch cause and in order to gain French and English support in the peace talks. Grotius was not directly involved in the lobbying, but he seems to have been an important source of legal arguments. At the request of Oldenbarnevelt, for example, who was the chief negotiator in peace talks on behalf of the Dutch, Grotius refrained from publishing the *Mare liberum* until after the conclusion of peace

talks. This work, which became a foundational source of modern maritime law, grew out of a project Grotius had begun much earlier on behalf of the VOC.

Earlier, in 1604, following on the heels of the Dutch capture of the Portuguese merchant ship *Santa Catarina* in the Strait of Singapore in 1603 and the auction of that vessel in the fall of 1604, the United Dutch East India Company (VOC) hired Grotius to pen a formal defense of the Captain Van Meeskerck's capture of the *Santa Catarina*. Grotius's lengthy tome that emerged from this contract with the VOC, *De jure praedae commentarius* (*Commentary on the Law of Prize and Booty*), defied the company's expectations of brevity. The VOC's interest in a speedy public defense of their captain's actions and their own financial benefit from the sale of the *Santa Catarina* was echoed in a letter to Grotius by his friend Jan ten Grootenhuys, who was also the VOC agent who hired him. Just a month after soliciting Grotius's services, Grootenhuys beseeched that "your apology, begun so felicitously, will be completed in a short while thanks to your attentiveness" (*Briefwisseling*, 1:45; trans. Williams 2006, 547). *De jure praedae* was not published until three centuries after his death, but Grotius capped the formal defense nearly 5 years later with a twelfth chapter, published independently of the others just weeks after the Dutch and Spanish peace talks concluded. That work, *Mare liberum sive de jure quod Batavis competit ad Indicana commercia dissertatio*, was distributed in late April 1609, once again in the service of the VOC, which had commissioned its publication in November 1608.

In his new position at Rotterdam, beginning in 1613, Grotius took up an equally daunting legal project to outline the laws of just war, which had occupied a central position in his argument in *De jure praedae*. In this new position, Grotius also became embroiled in provincial governance as a member of the Estates of Holland. In 1617, he rose to the Estates General, which served as the governing body of the Dutch Republic. In a political power struggle in which Grotius sided with Oldenbarnevelt, Grotius fell into a trap during a political visit to the Hague, and he was arrested for sedition in 1618, alongside Oldenbarnevelt and

some of his partisans, on the orders of *stadtholder* Prince Maurice of Nassau.

Grotius was tried in 1619 and then placed under guard at the castle of Loevenstein, until his wife, Maria von Reigersberch (1589–1653), helped him escape in a chest of books to Gorcum in 1621. After disguising himself as a mason in order to traverse the Netherlands unnoticed and fleeing to Paris, he found himself in a position of fame among fellow expatriates and scholars. The French crown granted Grotius pension of 3,000 livres, and he spent his time in Paris by making a living from his writing and legal reputation. He penned his own legal defense, the *Stobaeus* (1623), as well as lesser-known translations of Greek tragedies and comedies (1626), and in 1625 – of tectonic consequences for seventeenth-century European politics – the *De jure belli ac pacis* (*The Law of War and Peace*). Despite his continuous requests and appeals that his conviction of treason be overturned, he was officially banned for life from the United Provinces by resolution of the Estates General in 1632.

Grotius's seminal work on military law came against the backdrop of the Thirty Years' War (1618–1648), which was just ending the first phase and entering the period of Swedish intervention. This period of the war began with Gustav Adolf's invasion of Stralsund in 1630 and continued long after the king's death at the battle of Lützen in November of 1632. The so-called Lion of the North, who notoriously carried Grotius's works with him wherever he went, vied with other nations for Grotius to serve as a consultant and agent for Swedish interests. Grotius accepted the Swedish king's offer, which he received in 1634, 2 years after Gustav Adolf's death.

At that point, the Swedish army in Germany was under the command of Axel Oxenstierna, the chancellor of Sweden, with whom Grotius met in Frankfurt in 1634. Oxenstierna soon dispatched Grotius as an envoy to France, where he served as a tireless, but not especially tactful, diplomat. He laid the groundwork for France's intervention in the Thirty Years' War in 1636 – against expectations – on the side of Sweden and the Protestant forces through a combination of diplomatic straight-talk and theological nuance. Grotius's

writings on the law of war had established the principles of “just war” between Christians, but his theological writings during the last 10 years of his life worked to align France's religious and political concerns with those of the Protestant Swedes.

During this decade, Grotius produced his most innovative theological claims in a series of pamphlets. His unique and unorthodox approach to exegesis, which – like his poetic interpretations of Bible stories – employed an intensely detailed philological-historical hermeneutic bolstered by an exceptional and multifaceted foundation in classics and ancient history, both supported and limited Catholic powers and beliefs while also defending and rejecting some Protestant claims, for example, in his writing on faith and good works, *De fide et operibus* (1640), and in his claim in another pamphlet that the Pope was not the Antichrist.

Important among his theological works are his exegetical treatments of the New Testament, *Annotationes in Novum Testamentum* (1641), and the Old Testament, *Annotationes in Vestus Testamentum* (1644), both of which met intense criticism in his own day. They only became obvious for their relevance among scholars in the late eighteenth century. These works made clear his interest to serve not just one particular denomination but rather all Christians, whatever confession they may be.

He requested to be recalled to Sweden, and he traveled via Hamburg and Wismar to Stockholm in 1645. In Stockholm, Queen Christina received him warmly. Yet he felt unwelcome at the court because of rival courtiers. Begging leave, he traveled to Lübeck by ship but never made it. Just 3 years before the end of the Thirty Years' War, the great jurist of international maritime and military law was shipwrecked in Pomerania during his passage over the Baltic Sea. He eventually landed in Rostock, horribly sick and worn out. He died on August 28, 1645, 11 days after leaving Stockholm.

At his death, questions remained as to whether Grotius was really Protestant or whether he was rather a Catholic. The Protestant pastor Johann Quistorp, who tended him on his deathbed,

provided a simply written summary of their final conversation that clarified little on this point. Mid-seventeenth-century European partisan politics in response to his passing, on the other hand, divided along religious lines. Each side attempted to spin his death to their own advantage, including a story that claimed Grotius had been poisoned by the Lutherans. Hugo Grotius's religious confession, however, seems much simpler than the complicated political world of his time made it out to be; he died, writes one biographer, "a faithful Christian." His church was one of the future (*Zukunftskirche*), a unification of all Christians, a hope that he expressed in one of his final works, *Via ad pacem ecclesiasticam* (1642). Quistorp did not try to sway him from this faith in his fellow Christians as he passed.

Heritage and Rupture with Tradition

As a Dutch intellectual and politician in the age of the Reformation, Grotius was most heavily influenced – intellectually and spiritually – by the traditions of humanism and Protestantism, broadly speaking. His training in classical languages and literatures, as well as philosophy and poetry, is evident in his literary, philological, and theological writings. Because of this combination of humanist training and Protestant faith, Grotius's writings are founded upon references to classical authors and biblical sources.

Moreover, his political philosophy was tied tightly to his theological beliefs. Much of his legal and theological work, therefore, blends the methods of these fields with those of humanism. In *De jure belli ac pacis*, by one count alone, he cited eight classical figures over a hundred times each while also drawing from legal cases and biblical passages (Geddert 2014, 560). His theological stance throughout his writings conveyed a thoroughly irenic and ecumenical position, which joined smoothly to his political and legal discussions regarding natural law, natural rights, and distinctions of justice, especially with regard to war. Thus, Grotius, as many scholars of his work have sought to show, was constantly in conversation with the Bible, Aristotle, Plato, Socrates,

Xenophon, Cicero, Tacitus, Strabo, Irenaeus, contemporary theologians, and political philosophers regardless of whether he was writing about religious or political issues.

His theological works are unique to his time in their intensive application of a historical and philological hermeneutic, one more consistent with the study of classical literature than with theology of his day. His exegetical methodology was also compatible with his vision of a minimal Christian religion, founded on historically verified and self-evident principles that could be shared by all Christian (and, at times, non-Christian) believers. He had hoped that, by crafting shared core beliefs for all Christians, the Church could be unified and the secondary differences in faith could be relegated to "friendly debate" rather than lead to divisive politics and violent conflict (Nellen 2014, 445). Contemporary theologians criticized his views on some of these "secondary" issues, such as the Trinity, good works, and predestination, despite Grotius's proclaimed intention to diminish rather than inflame sectarian violence. At least partly, the French Huguenot Isaac Casaubon's *Exercitationes* (1614) – for which Grotius wrote one of the dedicatory poems – provided the irenic inspiration for such a vision of the Church.

Politically, Grotius's curriculum vitae paralleled a series of national and European political upheavals. These conflicts, such as the Dutch Revolt against Spain and the Thirty Years' War, inspired his treatises on international law and theological issues. Indeed, the powerful United Dutch East India Company (VOC) specifically contracted him repeatedly to write defenses or manuals on their behalf, and his late theological works were written in the political interest of the Swedish government. At the same time, major actors – among them Oldenbarnevelt and Gustav Adolf – in these conflicts were influenced, even driven to action, by the arguments of his legal and theological writings. His *De jure praedae* (1604–1605, 1609), for example, which was his first major legal work, intervened on behalf of the VOC in the ongoing conflict between the rebelling northern Dutch states and the crown of Spain and Portugal. Grotius's *De jure belli ac pacis*

(1625), on the other hand, which drew much of its argument regarding just war and the laws of war from his first major legal treatise, appeared during the first decade of the Thirty Years' War, which – at its conclusion in 1648 – turned out to be one of the most violent and disruptive wars in the history of Europe. Later, he would directly intervene as a political operative in this war as an agent of the Swedish government and envoy to France from 1634 until shortly before his death in 1645.

Innovative and Original Aspects and Impact and Legacy

International Law

The consensus among scholars depicts Hugo Grotius as one of the most important and influential political and legal theorists of the early modern period. In his age, Grotius's thinking inspired statesmen and intellectuals alike and acted as the inspiration, positively and negatively, for other major political theoreticians, such as John Locke (1632–1704), Thomas Hobbes (1588–1679), and John Selden (1584–1654). His contributions to political theory and international law culminated in his two major works on just war, international relations, and natural right, *Mare liberum* (1609) and *De jure belli ac pacis* (1625). While the political and biographical context of these works has been discussed at length above, this section will focus on the content and intellectual impact of these treatises.

Grotius published *Mare liberum* as a finishing nail for the stipulations of the truce hammered out between the Netherlands and Spain in April 1609. Its conclusions justified the concessions and terms made by the Netherlands in the peace process and certified Dutch sovereignty on legal grounds. The three main points of *Mare liberum* consist of arguments in favor of the freedom of the seas, the freedom of trade, and the freedom, validity, and enforceability of contracts between European and non-European powers. Grotius's principal argument declared the absolute neutrality of the seas and denied – via arguments derived from natural law theory – the legality of states to

declare sovereignty over the seas. This radical position, which drew heavily on the precedence of Roman law and other classical texts, reaped some equally fervent legal and philosophical responses since early modern and medieval states had long exercised sovereignty over their adjacent seas, especially Italy, England, Sweden, and Denmark. Even the Netherlands, contemporaries like John Selden pointed out, had a hypocritical relationship with the idea of *Mare liberum*, which they invoked when it supported their claims and denied when it worked to their disadvantage. The question was not quickly resolved among European powers. Only in 1713, after the Treaties of Utrecht, a tentative agreement held that immediately adjacent waters were within the sovereignty of the coastal nation they abutted to about the distance of a gunshot. The second main argument, the freedom of trade, had long been an accepted practice within Europe, but as European powers and their corporations colonized countries outside of the continent, they sought to monopolize trade within their spheres of influence. Grotius argued “that freedom of navigation and trade was a universal fundamental right which could not be legitimately restrained” (Weindl 2009, 142). Because this claim, to some degree, worked against the interests of the VOC, Grotius also declared the supremacy of *pacta sunt servanda* (contracts must be honored) as a regulating device for the absolute freedom of trade. The third and final argument of *Mare liberum* cemented the validity of the *pacta sunt servanda* clause, even in pacts with non-European peoples. Based in natural law and concepts of sovereignty, Grotius's argument stated that all humans and governments possess sovereignty so long as their rights within the scope of their sovereignty do not impinge upon the rights of others; thus, non-European people could sign legal contracts with Europeans. At the extremes, Grotius's declaration permitted people to sign their lives away into slavery, even if they did not understand the contractual terms that led to their enslavement; furthermore, the illegal breach of a contract could, according to Grotius, be legally punished in brutal fashion. *Mare liberum* had a tremendous influence on debates and treaties surrounding maritime law for over a

century after its publication. Within a few decades of its composition, the work functioned as a dominant text in trade talks involving the English, Dutch, Swedish, French, Danish, and Spanish, and it was critiqued and debated by scholars such as Scottish jurist William Welwood (1578–1622) and the English jurist and philosopher John Selden (1584–1654) on both sides of the English channel on legal and philosophical grounds.

Following on the heels of the *Mare liberum*, and completed while in exile in France, *De jure belli ac pacis* (1625) incorporated many of the unpublished arguments from the first books of *De praedae* (the foundational unpublished chapters of *Mare liberum*). *De jure belli ac pacis* (*On the Law of War and Peace*) consists of three books and a much-cited *Prolegomena*. The *Prolegomena* lays the foundational considerations – legal, theological, and philosophical – for a consideration of the nature of war and peace. Throughout this prologue, Grotius ponders the ideas of Aristotle, Cicero, Plutarch, Plato, Horace, and other classical authors as they relate to the laws of war and justice in general, not to mention the Bible and diverse European Christian theologians. One especially important, but also frequently misinterpreted, quotation regarding human reason’s relationship to law is the *etiamus daremus* clause in paragraph 11 of the *Prolegomena*, in which Grotius claims, “What we have been saying would have a degree of validity even if we should concede that which cannot be conceded without utmost wickedness, that there is no God, or that the affairs of men are of no concern to Him.” His contemporary enemies pointed to this clause as evidence of a heretical vein, and many modern scholars have held the clause up as evidence of his move to secularize law; recent scholarship, though, has been more eager to show that the existence of God is not in doubt in the clause or in any of his works for that matter. In Book I, he then defines his terms carefully, distinguishing especially the meanings of “war” and “law” and between “aptitudes” and “faculties,” “expletive and attributive justice,” and “natural, divine, and human law.” He then goes on to consider the legality of war, especially among Christians, and

he cites biblical and classical examples in order to tease out evidence for the legality of war according to natural law, the law of nations, pagan divine volitional law, and the law of the Gospel. Next, in Chaps. 3 and 4, he evaluates different kinds of war such as public wars and private wars, civil wars, and “wars of subjects against superiors” (rebellions). Book II, also a frequently cited and studied portion of the work, builds on the statement of two legal justifications for war: self-defense and punishment. Defensive war is undertaken to protect or restore any territory or property that is captured or attacked by another sovereign nation. Its justification relies, therefore, on the absolute right of a sovereign nation over held territory, which must be a tangible object. Justice can only be obtained, therefore, by the restoration of that territory to its original status or the capture of territory equal to the violated territory. Justice is restitutional in this argument because it is exactly equal to the harm inflicted. In that sense, it seeks to restore what once was. Punitive war, on the other hand, is a means of shaping the future of a space. It is undertaken not to restore a lost territory or to defend a territory which is being menaced but rather to punish criminals who are acting unjustly, against nature, or against God’s will. What is different from defensive war, Grotius notes, is that punitive war does not seek to remedy a wrong but to satisfy future needs. Thus, the judge (such as a prince or a government) of whether to wage a punitive war must possess prudential reason and situational judgment and must weigh the expenses (both of human and financial resources) of such a war against the potential promise of peace and prosperity that can be gained through military action. Book III handles what is commonly called *jus in bello*, that is, what is permissible in warfare. This book deals with issues such as the killing of enemies and the destruction and looting of property, as well as the punishment suffered by civilians as a result of war. Founded upon hundreds of classical and biblical sources, Grotius’s rules provide – both for modern and many early modern readers – an incredibly brutal range of acceptable practices in warfare.

Not surprisingly, and in consideration of the disastrous violence against civilians witnessed during the Thirty Years' War, which was in a nascent stage while Grotius wrote *De jure belli ac pacis*, he has frequently been portrayed as a villain in some scholarship of the twentieth century (cf. Michael Roberts, *Essays in Swedish History*, 1967) and even by Rousseau in the eighteenth century. Yet Grotius's legal scholarship also became the foundation of the United Nations' guidelines on just war, and scholars who have looked closely at his work tend to read his projects in a generous light. Besides the very concrete impact that his writings had on political pacts and international treaties of the seventeenth and eighteenth centuries, Grotius's writings also inspired the work of subsequent and contemporary renowned political philosophers like Hobbes, Locke, Smith, and Leibniz. As expected from a writer whose books, essays, and correspondence touched on so many issues with such nuance and breadth, Grotius's political theory lent material to the arguments of both absolutist and liberal philosophers of the seventeenth and eighteenth centuries. His legal works thus contributed to debates about such issues as private property rights, the social contract and civil liberties, as well as rights of resistance to state authority. Although he is frequently portrayed as a great secularizer of international law and political theory, it is also important to recognize the strictly Christian theological foundation of his political and legal positions.

Theology

In addition to his tremendous contributions to political philosophy, Grotius was famous for his unique approach to thorny theological issues. Grotius's theological works are tied closely to the spiritual debates of Reformation Europe with one major difference from most theologians. Rather than working to bolster a single confessional view, Grotius sought to create common spaces for Christians to agree and to cease fighting one another. Time after time, Grotius's theological treatises such as *Meletius* (1611, published posthumously in 1988), *De imperio summarum*

potestatum circa Sacra (1618), *De veritate religionis Christianae* (1627), and *Via ad pacem ecclesiasticam* (1642), not to mention in his personal correspondence and *Annotationes* of the Old (1644) and New Testaments (1641) and his legal treatises, reveal an interest in reaching an agreement upon a set of central elements of faith in order to eradicate sectarian strife in the Christian church. This principle of "minimal religion" also exposed Grotius and other religious optimists such as Isaac Casaubon to claims of Socinianist heresy, a rejection of the divinity of the Christ and the Trinity founded on the claims of the theologian Fausto Sozzini (Faustus Socinus, 1539–1604).

De veritate, another document hired by the VOC to serve as a guidebook for missionaries, is meant to "benefit all of my countrymen . . . for the propagation of the true Christian religion" and as a refutation of the errors of paganism, Judaism, and Islam (Grotius, *De veritate*, 1–2). Writing while in exile in Paris, Grotius sought to prove the essential tenets of Christian faith in order to "help propagate the Christian faith among unbelievers, pagans, Jews and Muslims" (Nellen 2014, 36). *De veritate* opens with doctrines Grotius believed to be shared by all religions and then proves both by common sense and argument the existence of God. Moving from world religions, in general, to the Christian faith, specifically, he then claimed the superiority of Christianity above other religions.

Grotius's classical training was central to this section of the treatise because his argument for the superiority of the Christian creed relied on Christianity's ability to house the best elements of pagan and Hebrew philosophy, from Aristotle to Moses. He was also an apologist for pagan religious practices, and at various points in *De veritate* and in other writings, he drew comparatively on religious customs among the Jews, Greeks, Romans, Phoenicians, Guineans, and Egyptians as they connected with Christian ritual practices, even ones which he considered superstitious but not contrary to divine law. For Grotius, the perfection of Christianity that made it superior to other religions was Christ's succinct law, "that we love God above all things and our

neighbors as ourselves” (*De veritate*, II, xvi). Ignoring other fairly commonly held Christian beliefs, such as the Incarnation and the Trinity, he held up the Golden Rule as the most essential and minimal element of Christian belief. Both in order to make the manual accessible to various confessions and in order to make it less confusing to converts, Grotius sidestepped many dogmatic distinctions, especially those points most contested by Christians in Europe. Next, he dismissed the notion that disagreements among Christians weakened the value of its doctrines, since such disagreements arise in many human undertakings, even the sciences of mathematics and medicine. Central to all Christians, he claimed, regardless of their beliefs was the endorsement of the Golden Rule. Less important points of faith might lead to disagreements, but all believers accepted this core tenet. In his final book of *De veritate*, Grotius turns to the reasonableness of the Christian faith, pointing especially to the teachings of the New Testament that are consistently and logically applied throughout: that there is one “perfect, powerful God, who cared for his creatures and who would reward them for obeying his commands, especially those exhorting them to live modestly and to love one another” (Nellen 2012, 39). It was only when people imprudently claimed other doctrines beyond these very reasonable beliefs, which can be adduced from the New Testament, as fundamental that conflict and strife arose among Christians. This belief that some doctrinal statements were more important than others led to a great number of personal attacks and criticism. Especially orthodox Calvinists like André Rivet and Claude Sarrau were convinced of his heretical Socinianism and dogged his writings with accusations of dubious and heretical beliefs.

Despite these and other accusations of religious heresy, Grotius’s theological optimism has been the central theme of modern scholarship about his religious works. Having died a devout Christian and renowned international thinker, Grotius and his writings remain vibrantly discussed in the journal *Grotiana*, as well as among political scientists, legal scholars, and theologians.

Guarini, Battista

Born: Ferrara 1538

Died: Venice 1612

Frank La Brasca

Centre d'Etudes Supérieures de la Renaissance,
François Rabelais University, Tours, France

Abstract

Battista Guarini has a great importance in the birth of modern literary criticism in the late Renaissance and at the beginning of the Baroque age. His major work, the pastoral drama *Il Pastor fido* ("The Faithful Shepherd") is a milestone in the history of this genre and had a great success in the Europe of the seventeenth century. Being translated in the main languages of the European courts (Spanish, French, and English), he influenced the fashions and tastes of the literate elites, his fame and success lasted until the Enlightenment.

Biography

Battista, the son of Francesco (grandson of the famous Quattrocento humanist Guarino of Verona), studied law in Padua where he became a friend of the great logician Jacopo Zabarella and subsequently was nominated professor of poetic and rhetoric at the university of Ferrara.

In 1564 he was invited to Padua by Scipione Gonzaga and took part in the *Accademia degli Etereî*, one of the numerous poetical Academies that flourished during the Renaissance in Italy.

He soon entered the courtier career at the service of the duke Alfonso d'Este the Second for

whom he executed several diplomatic missions in Venice, Rome, Turin, Cracow, and Warsaw during the 1560s and 1570s.

He started to compose his major work the pastoral drama *Il Pastor fido* ("The Faithful Shepherd") in 1583, left the court of Ferrara for a while and was summoned again by the duke to become his personal secretary from 1585 to 1588.

Tragical family affairs (his daughter Anna was murdered by her husband with the complicity of his second son Girolamo) forced him to move to several different cities: Turin, Mantua, Florence (where he became arch-consul of the famous *Accademia della Crusca*, the main institution in defense of the Italian language, which still exists to this day), and Urbino.

He spent the last years of his life between Rome and Venice where he died.

Impact and Legacy

Besides poetical compositions published in 1598 (*Rime*, Venice, Gio. Battista Ciotti), and the comedy *L'idropica* ("The Dropsical Lady") which was represented in Mantua in 1608, his masterwork is the pastoral tragicomedy *Il Pastor fido* mentioned above.

With this work, he inaugurated a new literary, theatrical, and musical genre that aroused an intense polemic which lasted through the seventeenth and part of the eighteenth century in the dominating Aristotelian trend that still ruled in the incipient realm of early modern literary criticism.

Numerous authoritative authors criticized Guarino vehemently for having subverted the strict rules of separation between tragic and comic elements that were clearly stated in Aristotle's *Poetics*.

A famous professor of rhetoric and poetic in the Paduan "Studium," Giason del Nores, had accused him of "monstrosity", for having given birth to a hybrid mixture of drama and comedy. This compelled Guarino to reply harshly to his censor through an auto-apologetic essay entitled *Compendio della poesia tragicomica tratto dai due Verati* (1602), a summary of tragicomical poetry based on the two *Verati* (Verato was the

name of a famous actor of the time who was also a friend of Guarino).

The wide success of the play, which was first represented in the Lombard cities of Crema (1595) and Mantua (1598) and translated into Spanish just after the publication of the final edition in 1602 and successively into French, English, and German, testifies that this work corresponded to the new sensibility of European literary scene in the age of absolutism.

The French philosopher and writer Voltaire, one of the most distinguished intellectual of the Age of Enlightenment with connections to the great monarchs of his times (Frederic the Second of Prussia and Catherine the Great Empress of Russia), highly praised the *Pastor Fido* which, in his words, was popular in Stockholm and St Petersburg while no Shakespearian play had never succeeded to cross the British sea.

The modern critics have recently stressed the innovative philosophical and even theological implications latent in the traditional framework of the play, obviously inspired by the similar work by Torquato Tasso (*L'Aminta*, 1573) and by a very impressive mastery of the classical sources (Sophocles, Seneca the Tragic, Theocritus, and Virgil).

With this subtle blend of existential consciousness of the fate that weighs on human destiny and of aspiration to the delight and pleasure that can be derived from a hedonistic use of all the senses (musicality of the phrase, charm of the forms, and sweetness of the sentiments), the *Pastor fido* constitutes a brilliant introduction to the world of baroque sensibility that will dominate the whole seventeenth century, and, at the same time, a delightful synthesis of the humanistic and Renaissance season of the previous ages. This explains perhaps its enduring success and prominent role in the history of literature and drama of our civilization.

Gučetić, Nikola Vitov

Born: 1549, Dubrovnik, Croatia

Died: 1610, Dubrovnik, Croatia

Erna Banić-Pajnić

Zagreb Institute of Philosophy, Zagreb, Croatia

Abstract

Nicolaus Viti Gozzius was one of the most important Croatian Renaissance philosophers, a polymath who actively participated in the public life of Dubrovnik. On several occasions, he was elected Rector. He left behind approximately twenty works, some remaining in manuscript. Although his most important works deal with the issues of aesthetics, he also wrote significant works belonging to the history of the Aristotelian strand of the Renaissance philosophy. Moreover, he was interested in political philosophy. His works were written in Latin and Italian.

Alternate Names

[Gozzius, Nicolaus Viti](#); [di Gozze, Nicolò Vito](#); [di Gozzi, Nicolò Vito](#); [Gučetić, Vitković](#)

Biography

Nikola Vitov Gučetić was born in 1549 in Dubrovnik, where he died in 1610. He was a descendant of a noble family and received his primary humanistic education in Dubrovnik. There is no reliable information on whether he ever studied abroad, yet his erudition is indisputable. Pope Clement VIII awarded him the Doctor of Philosophy and Theology title. Gučetić was a member of several academies in Dubrovnik, as

well as in Italy. In most of his works, he deals with natural philosophy, biblical-theological issues, and with problems of political philosophy. His intellectual development can be divided into several stages. In the first stage, as a follower of Peripatetic tradition, he writes his work *Commentaria in sermonem Averrois Cordubensis de substantia orbis*, an interpretation of Averroes' attitudes towards the movement, the substance, and the size of celestial bodies. In this stage, he also writes some works dedicated to the question of the Aristotelian concept of the soul. He is especially interested in the issue of the immortality of the soul. Gučetić therefore joins in polemics with some of the Aristotle interpreters regarding these issues. His most important works are written in the second, mature stage. In this stage's works, he elaborates on the issue of beauty and love (in the dialogues *Dialogo della bellezza detto antos* and *Dialogo d'amore detto antos*), essentially following Plato and the Renaissance Neoplatonism. His works of sociopolitical nature belong to the late stage, when he mainly relies on Aristotle's political attitudes. Gučetić's permanent preoccupation was the question of the soul. This topic is elaborated in his *Quaestio de immortalitate...*, but also in the treatises *De anima*, in late *Breve compendium in duo prima capita tertii de anima Aristotelis*, and in *Li discorsi della immortalità e felicità humana*. All aforementioned writings remained in manuscript.

Heritage and Break with Tradition

Early Gučetić's works are usually the commentaries on some of the key topics in Aristotle's philosophy. It is often argued that Gučetić is the author of the first Croatian systematic meteorology, elaborated in his work *Discorsi sopra la metheore d'Aristotele*. The work was written in the form of a dialogue, between Gučetić and his colleague, the renowned Dubrovnik philosopher – Miho Monaldi. Referring to certain issues of Aristotelian *Meteorologica*, he often mentions the experience of Dubrovnik seafarers. In the early stage of his life, Gučetić was engrossed in Aristotle's understanding of the soul. Regarding

the problem of the soul, he polemicized with the views of Alexander of Aphrodisia, preferring the views of Averroes. In following Averroes, he advocated attitudes close to the theory of double truth. In his works dedicated to the beauty, Gučetić mostly relies on Platonic or, more precisely, on Neoplatonic tradition, trying to reconcile it with his Christian beliefs. Regarding beauty, his basic attitude is that the physical beauty is merely the expression of spiritual beauty, which includes moral virtues (and is expressed in the ancient concept of *kalokagatia*). In Gučetić's concept of beauty, there is distinctive Neoplatonic affirmation of the relationship between the spiritual and physical. Solely beginning from the physical beauty can we reach the spiritual beauty, with the recognizable influence of Ficino and his attitude about beauty as the radiance of the idea of beautiful, and of God's goodness. Gučetić emphasizes the role of the senses in the experience of beauty. In Neoplatonic manner, Gučetić displays the range of beauty, from God as a source of beauty, to a beauty achieved in matter. Yet, in his concept of beauty there is a certain duality of the spiritual and the material. He reinforces his views on the beauty and the good through the example of his Muse, the beautiful Dubrovnik poet Cvijeta Zuzorić (Flora Zuzorić). According to Gučetić, there are two paths to beauty: knowledge and love. In the dialogue of love, the starting points are Plato's dialogue *Symposium* and Ficino's corresponding commentary. In Gučetić's treatment of beauty and love, a particularly prominent role belongs to music. In his political philosophy, Gučetić mainly relied on Aristotle's attitudes, but in the works on the sociopolitical issues (*Governo della famiglia* and *Dello Stato delle Repubbliche secondo la mente di Aristotle*) his own political experience is also included.

Innovative and Original Aspects

In the dialogues on love and beauty, Gučetić notably points out the significance of the female physical beauty. This is recognizable in detailed descriptions of the beauty of a particular woman,

Cvijeta Zuzorić. He writes these dialogues mostly following Plato, but as opposed to Plato, the participants of these dialogues on beauty are women. Although he insists that it is moral beauty to which we should strive, the emphasis of physical beauty is strongly present in dialogues on love and beauty that bring forth detailed descriptions of the female body. His concept of beauty includes some typical Renaissance elements, and the beauty is closely connected to proportions (extensively explained in his *Dialogo della Bellezza*). One of the important features of Gučetić's works is that in addition to his theoretical considerations, they are rich in specific examples from the life of his immediate environment in Dubrovnik.

Impact and Legacy

Gučetić's activity is related to sixteenth century Dubrovnik intellectual circle, where some of the most prominent Croatian Renaissance philosophers are found, such as Antonius Medus, who wrote commentaries on Books XII and VII of Aristotle's *Metaphysics*; Miho Monaldi, who wrote works in Italian dedicated to beauty; and poets such as Nikola Nalješković, Dinko Ranjina, Damjan Beneša, Ilija Crijević-Cerva, and others. Many of them were included as participants in Gučetić's dialogues. Gučetić's works have major cultural and historical significance, because they provide some specific examples of the lifestyle in his Dubrovnik milieu. The works on family and state governance issues abound in instructions for the proper behaviour in family and public life. The interpreters of Gučetić's work point out that he was the first Croatian author in the field of meteorology, and the first author of pedagogical writings, mainly due to his *Dello governo della famiglia*.

Guicciardini, Francesco

Born: 6 March 1483, Florence

Died: 22 May 1540, Florence

Paolo Carta

University of Trento, Trento, Italy

Abstract

Strangely, philosophy has not given Francesco Guicciardini the same attention that Niccolò Machiavelli has received, although they both, from different perspectives and diverse backgrounds, focused their work on the very same object: the search for a way to establish in Florence a “well-structured and well-ordered regime that enjoyed genuine liberty” and promote a true political life. Both men thought about this subject from the vantage point of their experiences and their fears. Both belonged to a generation which lived under the constant threat of war, as Machiavelli wrote to Guicciardini (January 3, 1526): “Always, as far back as I can remember, war has either been going on or has been talked about.” Each of them, in his own individual way, was an original scholar and had a great influence on the subsequent philosophical and political tradition. The reason behind Guicciardini’s marginal position in the field of philosophical thought may lie in the posthumous success of his work, due to the late discovery of some of his most influential writings, which included the *Dialogo del reggimento di Firenze* (*Dialogue on the government of Florence*) and the final draft of the *Ricordi* (*Maxims*), both published only in the second half of the nineteenth century. The popularity he gained in the sixteenth century, and which could have indeed affected the history of ideas, was limited to the *Storia d'Italia* (*History of Italy*, 1561) and the partial collection of his *Ricordi* (1576). Nevertheless, these two works did not fail to have a profound impact on political as well as historical and philosophical thought.

Biography

Member of an ancient patrician family, Francesco Tommaso Guicciardini was the third son of Piero Guicciardini and Simona Gianfigliuzzi. He was named Francesco after Francesco de' Nerli and Tommaso, after Thomas Aquinas. Marsilio Ficino, "the leading Platonic philosopher in the world at the time," was chosen to be his godfather, as he wrote in the *Ricordanze*, which is the main source for Guicciardini's biography (1508) along with his letters. His family history and its growing reputation are the subject of his *Memorie* (1508). In all his early works Guicciardini deals frequently with his formative years and his education. For instance, in a brief exhortation, *A se stesso*, written in 1513, we read that according to his father's wishes he was "brought up devoutly" (probably among Savonarola's *fanciulli*). At school he studied humanities: Latin, Greek, and logic, and later law. His legal education, crucial for his diplomatic and political career, and, we might add, also for his historical and theoretical approach, began in November 1498 in Florence. His first professor was Iacopo Modesti da Prato, a pupil of Angelo Poliziano. His teachers included the leading personalities of the republic, such as Francesco Pepi, Ormannozzo Deti, and Giovan Vittorio Soderini. In 1501, due to the great turmoil in the city, his father decided to send him to study in Ferrara. Out of disappointment, after 1 year, Guicciardini moved to Padua where he attended the lessons of Carlo Ruini, Girolamo Botticella, and Cristoforo Alberizio. In Padua, Guicciardini was determined to follow his mentor, Filippo Decio, whom he had already met in Florence: the greatest jurist of his time, as we read in his *History of Italy*. Moreover, in a *consilium*, Decio, who provided him with board and lodging for 2 years, remembered his pupil as "once the sharpest of my pupils in Padua and now a most distinguished doctor." While in Padua, Guicciardini worked on a *Repertorium in iure canonico*, a manuscript completed on 25 March 1505. Decio's teaching was a valuable foundation for his later development as historian and political writer. Back in Florence, he was asked to teach at the Studio Fiorentino. He became doctor in 1505 with a distinguished panel of professors.

He received his doctorate "only in civil law, to avoid the expense of twelve and a half ducats," for it was not important "to get the degree in canon law." At that time begins his career as a lawyer – a detailed overview of this period can be found in the *Ricordi degli onorari* that shows his clientele as well (Cavallar 1988). The connections between his legal cases as either professional lawyer or consultant and his early historical works are important, especially in the case of the *Storie fiorentine* (*Florentine Histories*, 1508–1509), developed during his legal traineeship. In November 1508, Guicciardini married Maria Salviati, the daughter of Alamanno, the chief of the *ottimati* opposing the gonfalonier Piero Soderini. On 17 October 1511, shortly after the conclusion of the Holy League, formed by Pope Julius II against Louis XII, King of France, Guicciardini was named ambassador to King Ferdinand of Aragon, thanks to a law tailored just for him, as he was only 28 years old and was supposed to be in his thirties to be entrusted with such a responsibility. While in Spain, he wrote the *Discorso del modo di ordinare il governo di Firenze* (known as *The Discourse of Logroño*), where he dwelt upon the feasibility of a new institutional architecture for Florence, made up of a senate of wise men with great expertise, capable of tempering the ruling political order that since 1502 had been essentially based on the Great Council and on the lifetime gonfalonier. His ideal relied on the Justinian's dyad "justice and arms" and advised the creation of a civic militia (as Machiavelli). His was an answer to the requests of the *ottimati* put forward during the last years of Piero Soderini's administration. Guicciardini's idea was not so original: something quite similar had already been mentioned in the fifteenth century, after the death of Cosimo, and suggested again in 1501, in a private meeting of 12 citizens, including his father Piero, aiming to challenge the harsh measures of the Great Council. The creation of a lifetime gonfalonier in 1502 was, as a matter of fact, an alternative to the political proposal of setting up a senate (Fubini 2007). As the years went by, his ideal remained more or less unchanged and thus he proposed it again in the *Dialogue on the Government of Florence*, drafted between 1521

and 1524. Returning from Spain in 1513, the Medici had returned to Florence, and so Guicciardini's political experience took place entirely in that context: in 1514 he was appointed one of the Eight of Ward, then one of the Signoria and member of the Lorenzo de' Medici's private council. In the meantime, he carried on his activity as a lawyer and was named Consistorial Advocate by Leo X in 1515. In the following years, his service to the Papal State began: at first as Papal Governor in Modena, with a view to reestablishing justice, then as Governor of Reggio as well as Modena. In 1521, he was General Commissary of the Papal army. With the election of Clement VII in 1523, he was appointed President of the Romagna (1524). From 1526 he was in Rome as counselor of the Pope, who appointed him General Lieutenant of his army, shortly after the conclusion of the League of Cognac. We date back to this very period (1521–1527) the extraordinary correspondence with his friend Niccolò Machiavelli, whom he admired as a man “exceedingly extravagant in your opinions” and “inventor of new and unusual things” (Atkinson and Sices 1996, 339). It deserves to be stressed that in his early *Florentine Histories* (1508), Guicciardini described Machiavelli's militia project as “a new and unusual thing” (Guicciardini 1998, 424): this judgment on his friend remained the same more than 10 years later.

After the sack of Rome in 1527 and the Florentine republicans' suspicions concerning Guicciardini's political behavior, due to his affiliation with the Medici, the first phase of his political activity was destined to end. In his solitude, three fervid literary years commenced, which he conceived as a different way of pursuing his political efforts. The drafts of the *Ricordi* belong to this period. The work represents a collection of thoughts that he started gathering during his mission in Spain. He began to write the *Cose fiorentine*, a history of Florence from 1375 to 1441 with brief accounts of the origins of the city's institutions drawn from historical, literary, and legal sources that he left unfinished. He wrote three orations, the *Consolatoria*, the *Accusatoria*, and the *Defensoria*, in which he set up a trial against himself, picturing the scene before the Quarantia, newly established with the restoration of the republic in 1527.

Especially in the *Accusatoria* and in the incomplete *Defensoria*, the jurist offers an example of his rhetorical skills, his expertise, and his education – e.g., the topic of witnesses' admissibility, or the issues related the administration of criminal justice in a republican framework. He wrote the *Considerazioni intorno ai Discorsi del Machiavelli* (*Considerations on the “Discourses” of Machiavelli*) in which he continued his dialogue and debate over political, historical, and legal issues with his late friend. In 1530, after the fall of the Florentine republic, Guicciardini became one of the Otto di Pratica, summoned to deal with the administration of justice throughout the city. Due to the punishments he inflicted, Florentines called him “Ser Cerrettieri” after Cerrettieri Visdomini, the executioner of the Duke of Athens, the tyrant of Florence during the fourteenth century. Just as Guicciardini was hoping to leave the city in 1531, Clement VII appointed him Vice-Legate and Governor of Bologna. After the death of the pope, with Florence ruled by the Duke Alessandro de' Medici, Guicciardini's fortunes began to fade, along with his hope of restoring a republican form of government to the city. In 1535 as advocate of Alessandro, Guicciardini undertook the task of responding to the republican exiles' complaints to Charles V, in which they called for a reform of the Florentine government to oppose the new tyrannical regime. They described it as illegitimate because of the Duke's misconduct and his lack of any title to rule. As on previous occasions, Guicciardini closely follows the established legal tradition on the topic. In the following years, he avoided political commitments, especially after the murder of Alessandro in 1537 and the rise of Cosimo de' Medici, the new Duke and true Prince of Florence. At this time he wrote his masterpiece (on which he worked until his death on 22 May 1540), the *History of Italy*. The *History* sprang from the *Commentarii della luogotenenza*, a memoir concerning the events which occurred during the period of his Lieutenantcy, in which he recalled his personal experience of the war of 1526–1527. In his *History of Italy* (the only work, together with the *Ricordi*, draft A, printed during the sixteenth century, after 1561), he once again portrayed himself as a doctor of law. In the late Renaissance, European jurists correctly pointed out that the *History of Italy*

was a book written by a legally trained historian, referring to it to shape their ideas upon the State, sovereignty (a word used by Guicciardini in the *History*), the real power of the emperor, and the right of war. In the *History of Italy*, as has been remarked, Guicciardini worked with archival documents in a way entirely new (Ridolfi 1982, 322). This method, as revealed by the footnotes of the *Cose Fiorentine* (a sort of dry run for the more advanced *History of Italy*), was rooted in legal reasoning. We find other examples of this in the *Florentine Histories*, e.g., in his analysis on the tyranny of Lorenzo de' Medici (depicted as a "concealed tyrant") which follows certain ideas taken from Bartolus' *De Tyranno* (Carta 2008, 2012a, b). Guicciardini displays these ideas once again in the *History of Italy*, where he describes Lorenzo as a private citizen, with no title and no jurisdiction but who gained so much power that he ruled the republic as he wished and the city's officials obeyed him as their lord. Thus he was a true concealed tyrant, legally speaking. However, it is the *Ricordi*, which clearly reveal the link between Guicciardini's legal education and his political theory. In dialogue with his friend Machiavelli and challenging his ideal of imitating the ancient *exempla*, Guicciardini underlines the necessity of looking for concrete political rules taken from experience ("These *ricordi* are rules" he writes in *ricordo* A 11) and shapes his book of maxims following the legal method of *regulae iuris*. However, the application of such rules to a specific case which might have different underlying circumstances required the use of discretion. Although in the light of his biographical experiences it might sound that the "imperious vocation to action" led Guicciardini to legal studies, we should not forget "the influence that his legal education had on the political man and author" (Ridolfi 1982, 10). Thus, that is why every attempt to deal with his philosophy and his political theory should begin by investigating his legally trained mind.

Guicciardini in the Philosophy of the Renaissance

Situating Guicciardini in the tradition of Renaissance philosophy is not an easy task. If we are to

identify his main points of reference, we should first note that, since most of his work was not intended for publication (except for the *History of Italy* and, perhaps at first, the *Dialogue on the Government of Florence*) his writings do not include explicit quotations. This does not mean that there are no references to the classical literature which was part of his humanist education: Plato, Xenophon, Aristotle, Cicero, Seneca, Tacitus, Plutarch, Augustine, Thomas Aquinas, as well as Dante, Petrarch, and Boccaccio were some of his preferred authors. However, it is not owing to their presence that we can trace the originality of his thought. Recalling these sources is useful in order not to take Guicciardini too seriously when he states that he is not familiar with philosophers. Moreover, we should not forget that Marsilio Ficino was his godfather, and his father Piero was a humanist, follower of Savonarola and Ficino's pupil. Undoubtedly, the aim of distancing himself from philosophy can be read as evidence of his preference for historians and jurists rather than philosophers. To put it succinctly, just as Machiavelli, he did not choose utopia as a method. As he wrote in his *Dialogue on the Government of Florence*, following his friend: "We shouldn't look for an imaginary government that is more likely to appear in books than in practice, perhaps like Plato's republic; instead, after considering the nature, the quality, the conditions, the inclinations – in a word, the humours – of the city and its citizens, we must look for a government that we are reasonably confident could be introduced by persuasion" (Guicciardini 1994c, 96–97). Thus, we might recall that from his very first works, e.g., the *Florentine Histories*, Guicciardini relies constantly on his legal background, which enables him, as an historian, to grasp in a unique way the difficult political and institutional issues of Florence at the beginning of the sixteenth century. As Felix Gilbert has pointed out, "in his very first work [...] Guicciardini already reveals the distinctive traits which persist through the whole of his life [...]; he stands out as the Florentine patrician exhibiting the benefits and limitations of an outlook determined by class, he displays the keen, legally trained mind to which the rich intellectual

heritage of the 15th century was only a useful instrument for practical ends, he shows himself possessed of an exclusive, passionate devotion to the world of history and politics. His mind, in its essential features, is definitely formed" (Gilbert 1939, 263). Therefore, it was his legal education, which underlies his entire political work, which made him capable of understanding in a profound way the emerging tension between the legal tradition and the political experience of states. He does not hesitate to take this perspective to extremes when he pragmatically analyzes political matters according only "to the reasons and practice of states" (Guicciardini 1994c, 159). Undoubtedly, he was led to this approach because of his arguments with Machiavelli – Guicciardini was not only his friend but also his most perceptive reader. Thus, although we might find a great part of Guicciardini's political ideas already in his early works, we should not forget that he attempted to refine and develop them through continuous debate with Machiavelli and his own political experience. As has been written, "for Guicciardini's political ideas did not originate primarily from theoretical study, but from his reaction to the political situations that confronted him" (Rubinstein 1965, 12). The close relation between historical events, political experience, and a theoretical framework clearly appears in his first endeavors, e.g., in the realistic constitutional project included in the *Discourse of Logroño*, written in 1512 while he was ambassador in Spain. In this work he tries to shape all the historical material collected for the *Florentine Histories* into a constitutional proposal. Such a text was conceived as an effort to define a proper republican government for Florence, with a senate along with the gonfalonier and the great council. It was a way of responding to the *ottimati's* aspirations. However, this endeavor was overtaken by events. Just a few days after Guicciardini completed his *Discourse*, the Medici were back in Florence and the republican period was over. This constitutional model was Guicciardini's ideal one, and it is recurrent in his subsequent production. This theoretical framework was based on Aristotle's mixed constitution; at the same time, however, Guicciardini relied much more on actual historical

Florentine experience and on the ongoing political debate connected to it. This model, as Alison Brown has pointed out, discussing its subsequent inclusion in the *Dialogue on the government of Florence*, should not be deemed a defense of a hereditary aristocracy. Thus, we should say that "Guicciardini's preferred government is not a hereditary aristocracy limited to the optimates, as it might appear, but rather a meritocracy" (Brown 1994, XX). In fact, although according to his model a senate of 150 men had the political power, the legislative power lay in the popular Great Council, entitled to appoint individuals to offices. The political power of the senate was curbed by the gonfalonier and furthermore "life membership of the senate was won not by birth but by previous performance in administrative offices and public debates" (Brown 1994, XXI). As Guicciardini wrote in his *Considerations on the Discourses of Machiavelli*: "the optimates must not be drawn always from the same lines and families, but from the whole body of the city." We may understand these ideas more thoroughly by reading one of his *Ricordi*, the collection of rules that he had started writing in 1512 and developed until 1530: "The fruit of liberties and the end for which they were instituted is not government by everyone – for only the able and deserving should govern – but the observance of just laws and order, both of which are more secure in a republic than under the rule of one or few. And therein lies the difficulty that so troubles our city. Men are not satisfied to be free and secure: they also want to govern" (C 109). In the previous draft (B 143) he had added: "this is the reason that ancient wise men and philosophers did not praise free governments more than others but preferred those that best assured the maintenance of law and justice." These ideas had already been discussed in the *Dialogue on the government of Florence*, taking inspiration from some of Ficino's ideas, as presented by Bernardo Del Nero, in an effort to examine the Medici's veiled tyranny. On that occasion as well, Guicciardini relied on juridical frameworks, taken from the *De tyranno* by Bartolus of Sassoferrato, which he had already used in the *Florentine Histories* to sketch his portrait of Lorenzo de' Medici (Carta 2012a). In

this case, however, the problem is presented “simply to open a discussion,” with a reference to the Machiavellian effectual truth where he states: “if it were possible to have an illegitimate regime that was governed as agreeably and well as a loving regime, the fact of its being illegitimate would not alone make it worse than the other [...] I believe that to know which type of government is better or less good, one should consider only its effects” (Guicciardini 1994c, 13). Guicciardini reveals a realistic attitude much more clearly than Machiavelli, since he always indicates the legal or philosophical tradition from which he is departing. An essential element of his theoretical framework is his personal relationship to the classics that have dealt with a particular issue. He always confronts them judging their results according to his own reason and experience. It is this use of reason that can either provide justification for a statement or call it into question. He could have written, just as Machiavelli had done: “I do not judge nor shall I ever judge it to be a defect to defend any opinion with reasons, without wishing to use either authority or force for it” (*Discourses on Livy*, I, 58). See for instance the *ricordo* C 33, in which he tries to explain the saying “a dishonestly acquired fortune is never enjoyed by an heir of the third generation,” relying on reason, and arguing against his father’s interpretation that relies on the authority of Saint Augustine. It is a way of thinking that is also backed by his legal studies and especially by Filippo Decio’s teaching. We have other evidence about this approach in his *ricordo* C 208, devoted to the downfall of the practice of law: “the science of law has come to such a pass,” he wrote, “that if one side of a case present a cogent argument and the other presents the authority of a scholar who has written on the subject, more attention will be paid to the authority.” Accordingly, all the time that should be spent reasoning is wasted in reading, in an effort comparable to a porter’s rather than that of an educated man. The *Ricordi* are his most interesting theoretical work if we want to delve into the ties between reality and tradition, between reason and authority. In this work Guicciardini’s unwillingness to search for a theory which departs from the nature of things as it is in truth is also clear. On many occasions, he

criticizes the astrologers (despite the fact that he had his own written horoscope) because of the mendacity of their predictions, as we read in *ricordo* C 125: “Philosophers and theologians, and all those who investigate the supernatural and the invisible, say thousands of insane things.” This is due to the fact that men are in the dark about such matters, so their investigation appears more as an exercise for the intellect than as really capable of finding the truth. Among the principles that represent “things as they are in fact” there is *ricordo* C 48, where Guicciardini says that every state, apart from the republic, is illegitimate, owing to their violent origins: “You cannot hold states according to conscience. For if you consider their origin, they are all illegitimate, with the exception only of republics ruling their own cities, and nowhere else. Nor do I exempt the Emperor from this rule – and even less priests, for their violence is double, since they force us with temporal weapons and spiritual ones.” This discourse is not based on abstract principles, relying on, say, a legal tradition, but it is backed by clear-cut historical experience, which Guicciardini explains in analyzing the related events in his *Cose fiorentine* and in some censored chapters of the *History of Italy*. Experience was the testing ground for every theory and at the same time the place from which his theory sprung.

No work shows Guicciardini’s method and theory better than the *Ricordi*, a collection of maxims and rules useful for judging political issues. In their various drafts, the *Ricordi* could also be read as a response to the method of imitation of ancient *exempla* devised by Machiavelli. The latter introduced his *Discourses on Livy* as an attempt to present in the form of commentary a body of examples helpful in ruling republics. A commentary, such as the legal ones, would have held its own authority for its contemporaries. If jurisconsults can be taught to judge according to a body of precedents, decisions (“sentenze”), and examples, derived from the history of their profession, why cannot rulers be taught to rule according to a body of examples taken from their history? According to Machiavelli, law, just like medicine, is a discipline that makes a successful use of antiquity. In this connection, the lessons

of history could be successful in politics only if used just like jurists and physicians do with the *exempla* of their own discipline. Guicciardini's *Ricordi*, a collection of *regulae* taken from his own experience, gives an account of the difficulties related to the successful use of Machiavellian method in politics. For instance, in his *ricordo* C 110, he wrote: "How wrong it is to cite the Romans at every turn. For any comparison to be valid, it would be necessary to have a city with conditions like theirs, and then to govern it according to their example. In the case of a city with different qualities, the comparison is as much out of order as it would be to expect a jackass to race like a horse." Guicciardini, referring to his friend Machiavelli, discourages the unconditional application of examples and precedents as a faulty method. Since he was a lawyer, he probably had in mind Justinian's maxim: "non exemplis sed legibus iudicandum est" (C. 7, 45, 13). One is to judge not according to examples, but according to laws and rules. In his *ricordo* C 117, he adds: "To judge by example is very misleading. Unless they are similar in every respect, examples are useless, since every tiny difference in the case may be a cause of great variations in the effects. And to discern these tiny differences takes a good and perspicacious eye." The example is not binding in the judicial process, when it is not considered suitable for the particular case. The necessary condition for relying on an example (or a "precedent" in legal terms) is the complete similarity of circumstances. Therefore, Guicciardini believes that it is not according to examples that one can judge rightly, but only according to rules. As we read in the last chapter of the *Digest*, *De diversis regulis iuris antiqui* (*On various rules from the ancient law*), also commented upon by his mentor Filippo Decio, and whose commentary was printed in a very successful book, "a rule is that which briefly expounds a matter." Legal rules are concise formulations drawn from the law: "the law is not derived from rules, but a rule is derived from the existing law." Therefore, the rule itself does not create law. A rule is derived from the union of several cases, which have the same rationale. It is a "coniunctio rationum," i.e., it is derived from what happens more frequently, in

other words, from what "normally" happens. Its application to a particular case, however, always requires the use of "discretion." The judge will have to see whether a particular rule may or may not be applied to the case in question, using discretion, above all, and passing from the universal rule to the particular case. This was the way of thinking for which a jurist such as Guicciardini received formal training. His *Ricordi* is an attempt to write a body of such carefully-crafted rules. The way Guicciardini tries to decode them and give us a key to the proper interpretation of his work is strictly related to his legal background, despite a still-present tradition of aphoristic writings. He was not simply writing a book of aphorisms, rather he aimed to write a real book of rules, as he revealed in the aforementioned *ricordo* A 11. Referring both to Aristotelian and to legal tradition, in the subsequent draft of the text (C 6) Guicciardini wrote: "It is great error to speak of the things of this world absolutely and indiscriminately and to deal with them, as it were, by the book. In nearly all things one must make distinctions and exceptions because of differences in their circumstances. These circumstances are not covered by one and the same rule. Nor can these distinctions and exceptions be found written in books. They must taught by discretion." The unconditional use of examples, which according to his idea of legal training, Machiavelli wanted to apply to politics, is completely called into question by his friend Guicciardini. Therefore, the debate about the foundations of modern political thought appears essentially as a dispute about the two different ways of applying examples and rules to a particular case. Nevertheless, there is a difference between a judge and a political actor. Indeed a judge, in those cases "which the law cannot determine by a fixed rule" and things are left to his discretion, can count on his *synderesis*, i.e., his conscience, as Guicciardini wrote (C 113), probably recalling Poliziano's philological investigation into these two concepts (Carta 2012b). "After considering all the circumstances and ramifications of the case," a judge must determine "what he thinks is right, according to his conscience, and in such cases, the judge needs answer to no man for his decisions" even if he "must answer to God,

who knows whether he has decided justly.” Nonetheless, as he wrote in his *ricordo* C 48 and his *Dialogue*, there is no place for conscience in ruling a state: a ruler, to be effective, can only judge according to the practice of states. In another *ricordo* (C 111), Guicciardini says that common men find the variety of opinions which exists among lawyers quite reprehensible, but they do not know that it depends on the nature of the subject rather than on a defect in men. Indeed, general rules cannot possibly comprehend all particular cases. Thus, specific cases cannot be decided on the basis of law, but must be dealt with according to the opinions of men, which are not always in harmony. He stresses that the same thing happens to doctors, philosophers, commercial arbitrators, and to “those who govern the state”: in all these cases, there is no less a variety of judgment than among lawyers.

These legal arguments can be found even in Girolamo Savonarola’s sermons, well known to Guicciardini. In a sermon of 7 March 1498, devoted to the proper way to judge and apply a rule, Savonarola said that among physicians and lawyers, some are able to discuss according to the rules and their books, but that they know neither how to rightly judge a case nor how to cure a patient. Some others have a profound judgment and thus know both how to judge and to cure. In short, these physicians come straight to the point, to the case at hand. The same applies to lawyers: they do not have to be able to cite examples and references taken from the legal books, but they do have to know how to judge a particular case rightly. Being able only to discuss without judging means knowing nothing and the same applies to the rulers of the republics. Those who know how to judge say: this rule has to be applied here in this particular case, but not to this other one, and sometimes they leave aside the rule, to judge according to equity, conscience, and discretion. They understand everything and see if a rule was not made for a particular purpose. Briefly, to use the words written by Guicciardini commenting on a saying (C 33): “How different theory is from practice! So many people understand things well but either do not remember or do not know how to put them into practice! The knowledge of such men is

useless. It is like having a treasure stored in a chest without ever being able to take it out.”

Just as Machiavelli, Guicciardini confronts several important humanist themes, such as the relation between fortune and virtue. Some of his *Ricordi* are devoted to this specific topic, e.g., in C 20 he deals with the success or failure of conspiracies, a typical Machiavellian issue. He writes that they are very dangerous, just because Fortune, “who plays such a large role in all matters, becomes angry with those who try to limit her dominion.” In other places he stresses that Fortune has great power over human affairs and these are constantly affected by fortuitous circumstances and accidents men could neither foresee nor avoid. Therefore, although cleverness and care may accomplish many things, they are not enough, because men also need good fortune (C 30). Even if someone attributes everything to prudence and virtue, reducing the power of Fortune, he should at least admit that it is a great gift to be born and to live in a time which prizes highly the virtues and qualities in which he excels. It is his great good fortune that his times need his virtues and qualities, and he adds, echoing a well-known Machiavellian idea: “to be sure, if a man could change his nature to suit the conditions of the times, he would much less dominated by Fortune; but that is most difficult, and perhaps even impossible” (C 31). These maxims, also used in his historical works, display a very accurate and analytical interpretation of Machiavelli’s political thought, together with features of indisputable originality. The extraordinary impact his *History of Italy* had following its early editions testifies that his method broke with a long tradition. He was soon considered the best historian of all time and used to define new and modern legal and political concepts by the most renowned historians, jurists, and philosophers of the late Renaissance, such as Jean Bodin, Alberico Gentili, La Noue, Montaigne, Harvey, or Bacon: *The History of Italy* became the book that any well-educated man should read (Luciani 1949, 223 ss.). Not to mention the importance he had among the religious reformer for those censored passages of his *History* devoted to proving the illegitimate origins of the temporal power of the Pope (alluded to in works by Alberico Gentili or Francesco Pucci, for instance). He was the one

who wrote: “Naturally, I have always wanted to see the ruin of the Papal State, but as fortune would have it, I have been forced to support and work for two popes. Were it not for that, I would love Martin Luther more than myself, in the hope that his sect might demolish, or at least clip the wings, of this wicked tyranny of the priests” (B 124). Furthermore, his *Ricordi* gave birth to a singular way of thinking about politics by means of a new and very imitated literary model. It cannot be denied that Guicciardini deserves to be considered as an eminent character of the “Florentine laboratory” of political thought (Fournel and Zancarini 2009, 9) as well as “one of the most important and challenging writers in the early modern period” (Brown 1994, XXVIII).

Guillermet, Claudio

Rodolfo Garau

ERC Project Early Modern Cosmology,
 Università Ca' Foscari, Venezia, Venice, Italy

Abstract

Claude Guillermet de Bérigard (1578 or 1590–1663, also known as Claude Beauregard and Claudio Berigardo) was a French philosopher, humanist, mathematician, and astronomer. He held the chairs of philosophy at Pisa and Padua and Venice. His name is mostly connected to the polemic pamphlet *Dubitaciones in dialogum Galilaei Galilaei*

lyncey (1633), one of the first reactions of the academic environment to Galileo's *Dialogo sopra i due massimi sistemi del mondo* (1632). The writing met with criticism for his superficial treatment of Galileo's theories. During his appointment in Padua, he authored a philosophical work with which he took critical stances towards Aristotelianism (*Circulus Pisanus de veteri et peripatetica philosophia*, 1647) and defended a form of atomism.

Biography

Claude Guillermet was born on 1578 or 1590 in Moulins, France, then the capital of the province of Bourbonnais. He likely graduated in Aix-en-Provence in 1621. He then moved to Tuscany where, after having being employed at the court as a secretary of Cristina of Lorraine and having been distinguishing himself for his classical erudition and proficiency in mathematics and medicine, was appointed as professor of philosophy at the Studio di Pisa in 1627, appointment that he kept for 12 years. Here he distinguished himself for his knowledge of classic philosophy, but also of natural sciences (he directed for a period the Giardino de' semplici). His biographers also attributed him the invention of a preparation against scurvy. During the Pisan period, his name is mostly connected to the polemic pamphlet *Dubitationes in dialogum Galilaei Galilaei lyncey* (1633), with which he criticized Galileo's *Dialogo sopra i due massimi sistemi del mondo* (1632). Galileo never replied to the attack, that on the contrary he judged weak and possibly made at command – a suspect that may be corroborated by the fact that Guillermet obtained tenure in Pisa soon after the publication of the *Dubitationes*. Mersenne intended to draft a reply to the attack, but was dissuaded by Galileo. But apart from this polemic, Guillermet enjoyed high reputation within the intellectual circles. In 1639, Guillermet accepts the offer of a professorship of philosophy in Padua, where he replaces Fortunio Liceti. In 1641, he publishes his main work, *Circulus Pisanus de veteri et peripatetica philosophia*, then reprinted in Padua in 1661. In the same city, he died on April 23, 1663.

Heritage and Rupture with the Tradition

The *Dubitationes* is mostly relevant from an historical perspective as it epitomizes the way academic authorities received the publication of Galileo's *Dialogo*. The text is dedicated to Ferdinando II de' Medici, grand duke of Tuscany – a circumstance which might signal the ducal backing to the publication, as an attempt to progressively recant his initial endorsement to the *Dialogo*. Its content displays well Guillermet's erudition, which scholars have understood as a trait of his libertinism. It repeats a series of classical anti-Copernican (and pro-Aristotelian) loci with scarce originality and excitement – as, for instance, the seemingly absurd consequences on the size of the universe, and the skepticism for the use of the telescope. Is worth of note however Guillermet's critique to Galileo's theory of tides – which occupies a good length of the writing – that is centered on the defense of the classical connection with the moon phases.

Innovative and Original Aspects

Circulus Pisanus de veteri et peripatetica philosophia (1647) had on the contrary original aspects. It was published after Guillermet's appointment in Padua, where he could profit from a freer intellectual environment. The "circles" mentioned in the work correspond to the different and consecutive teachings of Aristotelian natural philosophy that a professor had to give to his students (*Physics i-vii*, *Physics viii*, *De coelo*, *De ortu et interitu*, *Meteorology*, *De Anima*). The work is organized as a discourse between the Aristotelian Carilaus and Aristeus, who expounds the opinions of the ancient ones and the experiments of the modern ones. While Guillermet keeps himself at careful distance from theological controversies, he highlights the potentially irreligious aspects of Aristotelism and proposes a form of atomism based on Anaximander's theory of seeds. Guillermet's seeds are endowed with attraction and repulsion; however, he otherwise denies any causation other than the efficient one, thus endorsing a form of mechanism. Interestingly, Guillermet appears also to depart from

the apparent radical anti-Copernicanism of his *Dubitationes*, providing an ambiguous treatment of heliocentric themes such as the fluidity of the heavens, the centrality of the Earth, the solar spots, etc. These themes are always treated by the usual mingling of references to classical sources and modern experiments that characterizes Guillermet's production.

Impact and Legacy

Guillermet was the exponent of an intellectual stance that has been defined "erudite libertinism," which mixed, and often concealed, innovative ideas with classical erudition. In this context, the *Circulus Pisanus* gathered an initial favor among progressive intellectual circles; Mersenne, for instance, is often described as one of the figures who looked favorably at the work. But the second edition (1661) was already superseded by the success of Cartesian mechanism and had scarce impact. Some authors however polemized with the theological content of the work. While Guillermet had professed adhesion to the Church, he remained ambiguous on certain passages of the dialogue concerning themes –such as the creation of the world and God's freedom – that had theological sensitivity. Authors such as Samuel Parker, Pierre de Villemandy, Leibniz, and Bayle interpreted this in various ways – from concealed atheism to Pyrrhonism and Averroism.

Gunpowder in the Renaissance

Patrick Brugh

Loyola University of Maryland, Baltimore, MD, USA

Abstract

This entry focuses on the development of gunpowder technology in Europe during the Late Middle Ages and Early Modern Period (ca. 1300–1700). Also included in this entry is the historiographical debates about gunpowder weapons, especially those debate during the last 50 years of the twentieth century.

Brief History of Use in Europe

Europeans most likely received gunpowder from Asia as an established technology in the late thirteenth or early fourteenth century. Cannons became relatively common in Europe in the 1320s, but the first undisputed use of cannons on

a European battlefield was in the Siege of Cividale (1331). Despite this prevalence, however, cannons remained expensive and difficult to use throughout the fourteenth century due to the high cost of gunpowder and the burden of transporting the massive bombards that were most common at the time. The cost of gunpowder sank in Europe with the growth of petering plantations in the late fourteenth century, but sheer size of the weapons still made them difficult to use in situations other than sieges. Advances in manufacturing gunpowder by 1400 had outpaced the advances in metalworking for ballistic purposes.

Technical and tactical innovations of the fifteenth century allowed gunpowder a broader use in military operations. The Hussite Wars of the early fifteenth century saw the development of the *Wagenburg* a mobile wagon fortress covered with mounted small caliber cannons whose invention has been attributed to the Czech commander of the Hussite forces, Jan Žižka (1360–1424). The combination of light fortification and mobility took advantage of gunpowder weapons' strength (defending fixed fortified positions) and mitigated its shortcomings (difficulty of transport), which resulted in the first decisive deployment of gunpowder weapons in a large-scale armed conflict. Around the same time, the coming and production of powder also improved the transportation and preservation of gunpowder for different kinds of firearms. *Büchsenmeister*, the artillery masters becoming a more frequent part of armies around Europe, were beginning to test and calibrate new grain textures and charges of black powder to adjust burn time and maximize the utility and safety of using both big guns and smaller arms. By the end of the fifteenth century, artilleryists had "sought to create as many different forms of the same basic gun design as it was possible to imagine" (Hall 1997: 91). With this explosion of innovation also came dozens of incompatible and varied versions of guns. Of particular value to soldiers, however, were a few design standards that made guns more tactically effective in field warfare including longer gun barrels (to improve accuracy), cast bronze and forged iron barrels (to keep guns from exploding on their operators), and the development of cast iron shot to replace hewn stone (accuracy and safety).

The final major innovations that would carry gunpowder weapons into a central position on European battlefields were the inventions of match, flint, and wheel locks of the late fifteenth and early sixteenth centuries. These devices, which seem to have been invented and standardized by artisans in major trade towns of Italy and Germany, especially Nuremberg, allowed soldiers to more easily transport fire loaded shoulder arms and handguns. By the middle of the sixteenth century, throughout Europe, guns had developed into a technologically and tactically stable element of siege and field warfare. Commanders, writers, and philosophers alike now had to adjust their approaches to warfare in order to account for its ubiquity.

Heritage and Rupture with Tradition

Debates have ricocheted among contemporary historians as to the precise impact that gunpowder technology had on the practice of early modern warfare and "society at large" (Roberts 1967: 196). Of those who weigh in on this debate, two sides have emerged: the military revolution and a material counterargument. Among the historians who have argued for the revolutionary impact of gunpowder technology on the practice of war, Michael Roberts and Geoffrey Parker have been the most recognized for a methodology that combines tactical, cultural, and economic analyses of war in the early modern period. On the other side of the debate, scholars such as Bert Hall, John Lynn, and Kelly DeVries have crafted approaches that contextualize gunpowder within the long history of warfare from the Middle Ages to the origins of the modern state, while relying heavily on the technical and pragmatic limitations of gunpowder weapons on the battlefield and the leadership and innovation of soldiers and commanders wielding those weapons.

The general consensus among both groups of historians is that gunpowder technology became an indispensable part of the military commander's tool kit in the sixteenth century, but that its use had been strategically decisive in only a few large-scale conflicts up to 1500. Among the many aspects of European warfare impacted by gunpowder's entrée onto battlefields were military

law; army size, composition, and social structure; field and siege tactics; fortification design; the training and recruitment of soldiers and officers; the maintenance of standing armies as a part of the nation-state; and the relationship between philosophy, art, literature, and warfare.

H

Haak, Theodore

Born: 25 July 1605, Neuhausen

Died: 5 May 1690, London

William Poole

New College, Oxford University, Oxford, UK

Biography

Theodore Haak, born in Neuhausen in the Palatinate, eventually settled in England in 1638 after a number of earlier academic visits. There he formed an alliance with the intelligencer Samuel Hartlib and the irenicist John Dury. When the exiled Moravian Bishop Jan Amos Comenius arrived in England in the winter of 1641–1642, he was met by a welcoming committee consisting of Hartlib, Dury, Joachim Hübner, John Pell, and Haak himself. In 1645, according to the mathematician John Wallis, it was Haak who instigated the London meetings in experimental philosophy and medicine to which Wallis later traced the origin of the Royal Society of London. Haak served the English state as a diplomat and translator during the interregnum, and after the Restoration he was elected to the Royal Society in 1661, proposed by the President, the mathematician Viscount William Brouncker. He remained prominent and active,

handling and translating foreign correspondence, and communicating books presented to the Royal Society by foreign authors.

Heritage and Rupture with the Tradition

Haak was one of the many intellectuals displaced westwards by the Thirty Years War, and his heritage lay in the continental universities; his maternal grandfather had been the Rector of the University of Heidelberg, and Haak attended Heidelberg and Leiden, as well as Oxford, where he studied some mathematics. He represents not so much a rupture with any given tradition as an example of how the ruptures of war forced scholars of different academic traditions into contact and collaboration.

Innovative and Original Aspects

As an experimentalist, Haak was not particularly original. He did propose to the Royal Society “a compendious way of repertory” (probably some kind of data storage system) and a way of “recovering and increasing the attractive power of a magnet.” Magnetism indeed appears to have been an enduring interest, and Haak’s portrait in the Royal Society shows him with what is probably his magnet.

Impact and Legacy

As a scholar, Haak's major impact was as the translator of *The Dutch Annotations upon the Whole Bible*. Commissioned by the Westminster Assembly of Divines, this work appeared in 1657, after years of labor. His other important work was a translation of John Milton's epic poem *Paradise Lost* into German. Although this was unpublished, the first printed German translation, by Ernst von Berge (1682), made use of Haak's manuscript, of which the first three books are extant; they were only published in 1962. But it was Haak's international connections that made him essential to the early Royal Society and a significant figure in the history of early-modern philosophy.

Interconnections

Haak was essential to the English experimentalists because of his international reach. He was also one of the few men who remained at the center of English activities from the earliest days of the Hartlibians right through to the Restoration. In his earlier days, he corresponded regularly with Marin Mersenne, passing on to the Minim friar news of recent research and publications in England; as a septuagenarian, he brokered correspondence between Robert Hooke and Gottfried Wilhelm Leibniz concerning the viability of an artificial universal language, and indeed Haak remained a constant presence in the diaries of Hooke. Haak's first cousin once removed was Frederick Slare (1646/7-1727), FRS, a physician and chemical experimenter of note, who demonstrated white phosphorus before the society. Haak bequeathed his goods and chattels to Slare, and Haak himself developed a five-branched phosphorus lamp. Above all, then, despite his modest personal contributions to natural philosophy, alongside Henry Oldenburg, Haak was the preeminent "intelligencer" of the first generation of the Royal Society and was also a living link to the pre-Restoration generation of English natural and experimental philosophers.

Habit, Renaissance Concept of

Riccardo Pozzo

Department of Humanities and Social Sciences,
Cultural Heritage, Consiglio Nazionale delle
Ricerche, Rome, Italy

Abstract

In the Renaissance, habits provided the key-stone for all theories of subjectivity. It is the knowing subject that posits itself out of itself, namely, in what it knows, in order to bring back what it has known into the subjectivity of its mind.

Introduction

Habits have been thematized since the very beginning of philosophy. In ancient philosophy, habit indicates the disposition to certain actions or passions, which can be proper either to the individual

as a ἕξις (which is connected with character and attitude) or to the collective as ἥθος (which is associated with mores and usages). The know-how that is acquired by habit is a possession – whose opposite is privation – that results from repetition and exercise of individual actions, i.e., from experience and practice, which confers stability on human behavior. In this sense, the ἥθος (*habitus*, *consuetudo*) produces a ἕξις (*habitus*), namely, a determined disposition to acting, and constitutes for the human being, as Aristotle says, a second nature. Habits can be of two kinds, namely, the ones that follow the “rational principle in the proper self” and the others that are “obedient to it as a child to its father” (*Eth. Nic.* I,13, 1103a3-5); the former, Aristotle calls intellectual virtues, the latter moral virtues. “Virtues are engendered in us neither by nature nor yet in violation of nature; nature gives us the capacity to receive them, and this capacity is brought about by habit” (*Eth. Nic.* II,1, 1103a24-26).

Heritage and Rupture with the Tradition

The first thinker who thematizes habit is Plato. In *Resp.* and *De leg.*, when looking into the issue of educating the philosophers-guardians in the ideal state, he considers the power that good and bad habits exercise on human behavior. Plato considers habits both as “having of cognition” (*Theaet.* 197a) and the capacity of improving one’s dispositions, or abilities, by means of exercise (*Phaedr.* 268e). Given that not even reason can contrast the power habits have once they have been acquired, it is important for the lawgiver to take care that the educational system favors the acquisition by the future philosophers-guardians of good habits of body and soul.

The first extended scientific investigation of habit is provided by Aristotle within practical philosophy. It is the way to knowing ethics and politics, the disciplines that consider human action and its best actualization, which are called practical in as far as they consider what has to be done in the praxis.

Habits have provided the keystone for all theories of subjectivity. It is the knowing subject that posits itself out of itself, namely in what it knows, in order to bring back what it has known into the subjectivity of its mind. If it is true that both Platonism and Aristotelianism have contributed to the genesis of subjectivity, it is important to look more closely into the actual extent of their contribution. A definition of habit has always been seen as twofold: it can be considered as a human ability and is then to be regarded as a mental habit (*ars interna*); it can, however, also be considered as the corpus of doctrines resulting from the use of that ability (*ars externa*) and is, in this case, to be regarded as a system.

Innovative and Original Aspects

The modern understanding of subjectivity was born during the Renaissance out of the relation between habit and system, or, to put in contemporary terms, between psychologism and scientism. Against the Platonic assumption that systems are *extra mentem*, *in rebus*, that they are *realia*, *principia*, and that they apply to things themselves as *primae notiones*, the Renaissance Aristotelians, first and foremost Jacopo Zabarella opposed that every theory presupposes an intellectual habit, which is *in mente*, *a rebus seiunctus*, *instrumentalis* and considers *notiones secundae* (Zabarella 1578, I,5). In *Eth. Nic.* II, habits are dealt with in terms that influence the whole ancient and medieval philosophy. The problem is momentous, for while an intellectual virtue is a ἕξις that is “produced and increased by instruction” and requires, therefore, “experience and time,” moral virtues are “the product of habit,” which in this case is ἥθος (*Eth. Nic.* II,1, 1103a17).

Impact and Legacy

Aquinas distinguishes between habits and potencies and maintains that habituation is possible on potential having: “habits differ from potencies,

because potencies enable us to do something, while habits do not enable us to do something, they make us able or unable to act well or bad. Habits cannot take away from us anything, although we learn through habits to act well or bad” (*Summa contra Gentiles* IV, 77). While Aquinas does not know Eustratius, the latter’s impact is made possible by Robert Grosseteste’s thirteenth-century Latin translation of his *Ethics* commentary. Eustratius makes it clear that habits are spiritual substances ordered in a procession (πρόοδος) towards the νοῦς. For Eustratius, intellectual habits belong to metaphysics, which unifies intellect and science. All other sciences presuppose their principles as known, while metaphysics explains and demonstrates: it is the head of all sciences (CAG 20, 324).

Philipp Melanchthon expands the use of the Greek and Latin term “method” from medicine into philosophy: “the ancients call method a ἔξις of teaching correctly and in an orderly manner” (Melanchthon 1528, fol. Lr-v). According to Melanchthon, method is a ἔξις, a disposition of the intellectual part of the soul that can be predicated on a human being as one of the qualities referred to by the Aristotelian category ἔχειν, *habitus* (Melanchthon 1547, CR 13: 561–63). In fact, students ought to pick up the habit of “relating everything to method” (Melanchthon 1536, CR 11: 281). For method is in itself a habit, “it is a certain habit, or science, or art that makes a way by means of a reason that is certain, i.e., that finds and opens a way through an inaccessible region, which is covered by briers, through the confusion of things, that invents and puts in order things pertaining to what has been proposed” (Melanchthon 1547, CR 13: 573).

Interconnections

Jacopo Zabarella states that logic – the discipline without which no part of philosophy could be construed – lies in the human mind as a *habitus instrumentalis*, which is functional to the acquisition of all other disciplines in its theoretical part (*logica docens*), and which vanishes or rather becomes identified with the individual sciences

once it is applied to the various kinds of knowledge (Zabarella 1578, I,3–8). Zabarella’s stipulations on the definition of science are in themselves an explanation for views concerning (1) practical sciences such as ethics and politics, (2) the arts connected with the narrative and persuasive functions of language, and (3) the productive techniques, which he stamps as *sordidae* – with the consequence that it would be unworthy to force rhetoric and poetics to serve them. Francesco Piccolomini maintains against Zabarella that the order of the disciplines and the way of teaching are similar in part, though they also differ, for the latter is based on the mode of our own cognition, “while the former is based on the nature of the things that are dealt with” (Piccolomini 1601, 5). In fact, Aristotle has meant in *Phys.* I,57, and *De an.* II,34 “in servando ordine nos debere naturam sequi, et ordinis primis.” Also when learning logic, then, we follow an order, “which nature offers us and which we find out in the nature of things” (Ibid.). Piccolomini inspires the first comprehensive treatise on habits of the Italian Renaissance, Andrea Duodo’s *De habitibus intellectus libri sex* (Duodo 1577), which follows Eustratius’s notion of the ascending procession of the habits toward the intellect and precedes by a few years the ample ascending exposition of habits provided by his teacher Francesco Piccolomini in the *Universa philosophia de moribus* (Piccolomini 1583).

Ḥanokh ben Solomon ben Ḥanokh al-Qoṣṭanṭīnī

Born: Unknown

Died: Unknown

fl. before 1384

Görge Hasselhoff

Fak. 14 Humanwissenschaften und
 Theologie, TU Dortmund, Dortmund,
 Germany

Abstract

In his well-preserved and well-transmitted treatise *Mar’ot Elōhīm* (“Visions of God”), the Iberian Neoplatonic philosopher Ḥanokh al-Qoṣṭanṭīnī (fourteenth century) compares and interprets the visions of God by Biblical prophets. His cosmological reflections are one of the bridge stones between the Maimonidean philosophy of the twelfth through the fourteenth century and the later traditions of the fifteenth century, e.g., Ḥasdai Crescas.

Alternate Names

[al-Kostantini](#), [Ḥanokh ben Solomon](#)

Biography

Little is known about Ḥanokh’s biography. He seems to have been a medical doctor and lived in Spain toward the end of the fourteenth century. Since Langermann (2003, p. 184) refers to a manuscript (MS St Petersburg, Russian National Library Evreiskii II A 73) not mentioned by Sirat which is dated Aleppo 1384, he must have finished the work before that date. His father seems to have been Solomon ben Hanokh Al-Qostantini, author of the *Sefer Megalleh Amukot* (The Revealer of Hidden Things), usually dated Burgos 1352 (e.g., Vatican Library, MS ebreo 59, cf. Sirat 1985, p. 445).

His only known work is the *Mar'ot Elōhīm* (Visions of God), an allegorical commentary on (and comparison of) the visions of the Biblical prophets Isaiah, Ezekiel, and Zachariah. Usually, he is counted among the Neoplatonic thinkers.

Heritage and Rupture with the Tradition

Ḥanokh remains an unoriginal thinker in the Maimonidean tradition. He quotes intensively from Maimonides' *More ha-Nevukhim* (Guide of the Perplexed in Shmuel ibn Tibbon's translation) but also from Ibn Gabirol's *Fons vitae* (Fountain of Life) in Shem-Tov ben Joseph Falaquera's Hebrew translation. Additionally, he seems to have used Averroistic writings and perhaps even Christian texts translated into Hebrew (Sirat 1985, p. 343).

At one point he seems to correct Maimonides' cosmology in so far that Ḥanokh interprets that the tenth sphere is not empty as was held by him in Guide II, 9. This "correction" might be taken from Moshe Narboni (Altmann 1987, pp. 53–54).

Impact and Legacy

Although we are not informed about a direct impact of his work, it was relatively broadly transmitted. The treatise is preserved in at least 20 manuscripts. He was commented on at least by Menahem b. Jacob Kara (fifteenth century) who wrote a commentary on that work (Suler 1935, 412; Oxford, Bodleian Library, MS Opp. 585).

Happiness, Renaissance Concept of

David A. Lines

Italian Studies, School of Modern Languages and Cultures, University of Warwick, Coventry, UK

Abstract

Renaissance thinkers discussed happiness on the basis of religious and philosophical traditions, which strongly interacted but often discussed the concept at cross-purposes. Whereas Christian notions of happiness centered around God, philosophical discussions usually had in view man's happiness from a more earthly perspective. Yet philosophers did not agree on what constitutes happiness: Aristotle's inclusivist view of happiness (*eudaimonia*) differs sharply, for instance, from that of the Stoics or the Epicureans (who emphasized virtue and pleasure, respectively). Matters were further complicated by the fact that the Greek term *eudaimonia* lacks a direct equivalent in Latin, where it was often translated by *felicitas* or *beatitudo*. Such matters gave rise to a remarkable variety of views in the Renaissance, as interpreters tried to identify

true happiness, often attempting to reconcile these different positions in a way that made sense to Christians who also valued Platonic (or Neo-Platonic) perspectives. This entry mainly focuses on *individual* happiness, but one should be aware that thinkers also often discussed what makes a happy community or political system.

Synonyms

Beatitude; Fulfillment

Introduction

In discussing the Renaissance concept of happiness, one must remember both the semantic range (especially in Latin and Greek) of the term translated into English as “happiness” and the layered traditions surrounding this concept starting with both religious and philosophical circles in antiquity. Furthermore, it is important to keep in mind that discussions of happiness vary a great deal depending on whether one is thinking about individuals or communities, and whether one has in mind different kinds of beings (ranging from animals even to God).

Heritage and Rupture with the Tradition

As was often the case with other topics, in their discussion of happiness, Renaissance writers and interpreters depended on (and brought together) both biblical and classical sources, as filtered and modified by translations and the commentary tradition.

In classical antiquity, there are no systematic discussions of happiness (although Plato’s *Philebus* and other works often refer to “the good” and the *Gorgias* includes several relevant points; see White 2006, pp. 7–40) until Aristotle’s masterful treatment in the *Nicomachean Ethics* (I.1, I.7–10, I.13; II.3; X.6–8), *Eudemian Ethics*, and *Magna Moralia*. Famously, Aristotle promotes an inclusivist view of happiness or

eudaimonia (best rendered as “flourishing” or “well-being”), which depends in part on the active exercise of virtue; on factors such as wealth, good fortune, good reputation, and health; and in part even on how one’s descendants keep high one’s good name (Annas 1983, Chap. 18). It is the enjoyment of all of these factors (and all the virtues, both moral and intellectual) at once that makes for the truly happy (i.e., fulfilled) individual. Most other pagan writers present models in which a single element predominates: the surviving fragments from Epicurus point to pleasure (both physical and intellectual) as the main element of happiness, whereas the Stoics strongly emphasize the exercise of moral virtue, unaffected by the troubles of the body or the soul (*ataraxia*) and indifferent to the presence or absence of external goods. For the latter position, one of the most developed statements is Seneca’s *De vita beata*, a work that had a remarkable diffusion in the Middle Ages and seemed able to bring together the Christian and pagan positions (Valero Moreno 2015). In particular, the New Testament’s exhortations that believers should remain steadfast when tempted or persecuted could be made to dovetail well with Stoic considerations about accepting fate and adversity. Yet on several occasions, as we shall see, Christian writers condemned Stoic views. As for Epicureanism, in the Renaissance it usually continued to be misrepresented (even by those who should have known better) as an animal-like pursuit of sensual pleasure and was therefore largely dismissed (Lines and Kraye 2013, pp. 32, 37).

Both the Bible and the Church Fathers make numerous references to happiness or, more precisely, to the *vir beatus* (the happy man) and the *vita beata* (the happy life). In the Scriptures, two of the most significant treatments are in the book of Psalms and in the Beatitudes (Matt. 5:1–12), part of Jesus’ Sermon on the Mount. The Psalms present the happy man as the one who is righteous, not partaking in the deeds of sinners, but meditating on and walking according to the Law of the Lord (Ps. 1, 118:1). He is the one whose sin is forgiven and not imputed against him (Ps. 31:2, 32:1–2), or who hopes in God (Ps. 33:9, 39:5, 83:6, 13), or whom God claims as His own

(Ps. 39:5, 64:5, 143:15). Likewise, Proverbs presents as happy the man who seeks and listens to wisdom (3:13, 8:34), a point often repeated in Ecclesiasticus (or Sirach: 14:1–2, 25:11–15, 31:8–11). In these passages, happiness is regularly regarded not as an emotion but a state of blessedness deriving directly from contact with God, which is nearly always mentioned in the same verse, suggesting that happiness derives from listening to and following God. Matters are slightly different in the Beatitudes of Matthew 5 (cf. Luke 6:20–23), where the concept of happiness is presented more as a future condition compensating for (or rewarding?) the poverty of spirit, humility, suffering, mercy, peace-making, purity of heart, or persecution experienced by people thirsting after righteousness in the present world. Here the causal link with God is indirect and more subtle.

The theme of a happy life is addressed more directly – although again not systematically – by St. Augustine of Hippo (354–430). In the *Confessions* (X, 20–23), a happy life (*vita beata*) is clearly something strongly associated with God Himself, so much so that the Church Father declares “when I seek Thee, my God, I seek a happy life” (X, 20). As a result, when Augustine comes to discuss enjoyment (*gaudium*), he recognizes that this is something that the godless do not really possess, since its true form is experienced only by those who worship God (X, 22), although when asked, anyone, of course, would reply that he strives for the happy life (X, 21). In his *City of God* (XIX, 4) Augustine mocks the Stoic view of the happy life, which all-too-easily leads to the philosopher’s suicide (an attempt, not to bear but escape life’s trials). Instead, he emphasizes that “the supreme good of the City of God is everlasting and perfect peace,” removed from adversity (XIX, 20). He admits that “a man who makes his life here below a means to that end which he ardently loves and confidently hopes for can even now be reasonably called happy” (*ibid.*). Yet, at the end of the work (XXII, 30), Augustine describes the “full, certain, secure, everlasting felicity” to be enjoyed in the next life by the members of the City of God. Crucially, the resurrected body is no impediment to enjoying

this felicity, although the presence of God and the absence of sin are essential to it (Trinkaus 1965, pp. 21–31).

A similarly influential Christian position on happiness was that of Thomas Aquinas (c. 1225–1274) in the *Summa theologiae*, Ia IIae, qq. 2–4 and *Summa contra Gentiles*, III. Although he drew on both Aristotle and Seneca, Thomas’ main interest was in eternal beatitude. Thomas held that “the knowledge of God is man’s last end . . . Now the last end of man and of any intelligent substance is called *happiness* or beatitude . . . Therefore the last beatitude or happiness of any intelligent substance is to know God” (*Summa contra Gentiles*, III, 25 as quoted in Trinkaus 1965, p. 31). It has been noted that, while this position did not ignore earthly affairs, much of the ethical thinking in this period was “oriented towards a monastic mentality of spiritual ascent, in which the heavenly sphere was pre-eminent” (Poppi 2013, p. 245). The final canto of Dante Alighieri’s *Divine Comedy* also points in this direction. But Thomas’ view of happiness has a more speculative and less affective tinge than that of Augustine, partly because it denies that happiness is the result of an act of the will (Trinkaus 1965, pp. 31–36). The tension between these two positions was a common feature of subsequent discussions, and writings on the problem of the will often touched upon happiness (Leinkauf 2017, I, pp. 647–706).

Humanists of the fourteenth and fifteenth centuries produced a remarkable number of works dealing with happiness or the good (rapid listing in Trinkaus 1965, pp. 42–46, although Trinkaus often confuses happiness with optimism, confidence, and satisfaction), reflecting a bewildering variety of positions (Trinkaus 1965, pp. 141–144, 146–149). Traditional historiography has often seen these works as evidence that Italian humanism strongly disrupted the older Christian view, pointing the attention of learned men and others toward the importance of earthly matters and emphasizing the value of the active (as opposed to the contemplative) life. One certainly notes an expansion of perspective-taking place, expressed through the works of figures such as Leonardo Bruni, Matteo Palmieri,

and Giannozzo Manetti (Leinkauf 2017, I, pp. 856–859). Yet one should not be too quick to dismiss the continuing importance of the Christian heritage and the beatific vision (Poppi 2013, pp. 246–247). Nor should one be too sure of these works' optimism in the possibilities of finding happiness in the present world (Trinkaus 1965, pp. 46, 65–69, 121–40). Petrarch himself was strongly tied, especially after his conversion, to a Christian and Senecan model (Trinkaus 1965, pp. 42, 58, 84–86; 1970, pp. 3–50; Witt 2003, pp. 230–291; Leinkauf 2017, I, pp. 270–76), something reflected also by at least some writings of Coluccio Salutati (von Martin 1913; Lombardo 1982; Witt 2003, pp. 292–337). Poggio Bracciolini observed in his *De infelicitate principum* that even rulers are regularly unhappy (Trinkaus 1965, pp. 53–56, 87–90, 122–26). Lorenzo Valla's *De voluptate ac vero bono* is set up as a dialogue (which complicates interpretations), but nonetheless seems to see happiness less in the secular perspectives of extreme Stoicism or Epicureanism than in the pleasure of Christian enjoyment of God (Nauta 2009, pp. 152–190; cf. Trinkaus 1970, pp. 103–70). Bartolomeo Facio's *De vitae felicitate* and *De hominis excellentia* (both written after, and partly in response to, Valla's *De vero bono*) acknowledge the worth of human talents and activities, but at the same time subordinate these to the ultimate end of contemplating the divine (Trinkaus 1970, pp. 200–229). Donato Acciaiuoli's 1478 publication of the lectures on the *Nicomachean Ethics* by the Greek émigré Johannes Argyropoulos strongly endorse a Christian vision of happiness (Acciaiuoli 1997). And Marsilio Ficino's letter "On Happiness" (Ficino 1990), while similarly drawing strongly on Plato, has other-worldly happiness firmly in view, as do the orations of Giovanni Pico della Mirandola (Trinkaus 1965, pp. 100–104; Poppi 2013, pp. 258–261; see also Lines and Kraye 2013, pp. 38–40). The Neapolitan historian Tristano Caracciolo (d. 1517?) encourages his contemporaries in his *De varietate fortunae* to avert their gaze from present calamities and misfortunes and pursue instead the joy deriving from following God's commandments (Trinkaus 1965, pp. 129–30).

This Christian slant continues and indeed intensifies during the sixteenth century, given the importance of current theological debates. Writers such as Philipp Melanchthon, one of the most important Lutheran theologians, consider the claims of Aristotelian moral philosophy and to what extent they can be reconciled with those of the Gospel. Clear tensions are outlined between the natural morality, and aims outlined by pagan philosophers and what is expected in the New Testament of individuals whose sinful nature has been transformed by God's grace and the work of the Holy Spirit (Melanchthon 1997; Saarinen 2013, pp. 83–89). Others within the tradition of the Catholic Reformation, such as Emmanuel de Goes, author of the Coimbra commentary on the *Nicomachean Ethics*, often remain very close to Thomas Aquinas and his emphasis on the supernatural, other-worldly happiness (Coimbra Jesuits 1997; Poppi 2013, pp. 269–70). In these writers, culminating with the massive *Ethics* commentary of the Jesuit Tarquinio Galluzzi (1632–1645), a long-standing tradition is rather buttressed than challenged (Lines 2002, pp. 374–76).

Innovative and Original Aspects

Although Renaissance thinkers continue to approach the issue of happiness through a Christian lens, they differ from their predecessors, especially in two ways, which often go hand in hand: in a greater attention to earthly matters (though not necessarily to the extent emphasized by Eugenio Garin and Hans Baron) and a different use and combination of ancient sources. But one also sees an interesting extension of discussions of happiness: first of all, these go beyond Latin to embrace the various vernaculars; secondly, some writers give attention to the happiness of human beings versus that of animals; finally, an increasing point of debate is the relationship between happiness of the individual and the community. Within all of these works, a constant tension is whether to view happiness as man's ultimate end or as a state of emotional contentment and satisfaction.

Several of these trends are apparent in the work of Francesco Piccolomini (1523–1607), a professor of philosophy in Padua who produced the most sophisticated and influential Latin work on moral philosophy in sixteenth-century Italy. The *Universa philosophia de moribus* (1583, rev. ed. 1594) is a recasting of Aristotle's *Nicomachean Ethics*, joined together with and reconciled with the doctrines of Plato and Christianity (Poppi 1997, pp. 49–55, 59–78; Plastina 2002; Kraye 2002). There is a clear understanding of the Christian God as the goal of life; yet, at the same time, Piccolomini also emphasizes that true happiness must include earthly goods and political activity (Poppi 2013, pp. 267–69). Piccolomini also produced a vernacular compendium of this work for the benefit of the Medici Grand Dukes (Lines 2015). By so doing he was actually following an increasing trend, starting especially in the 1540s, to discuss philosophy in the vernacular as well as in Latin, the conventional language of learned men. A key work from this perspective was that of Francesco's Sienese relative Alessandro Piccolomini (1508–1579), who was behind a vast program of turning the whole of Aristotle's philosophy into the vernacular. Particularly significant was Alessandro's *De la institutione di tutta la vita de l'huomo nato nobile e in città libera* (1542), reissued with substantial changes and additions in 1560 as *Della institution morale libri XII*. This work explicitly aims to supplement Aristotle's views of virtue and happiness with those of Plato and considers them both from a strongly Christian perspective (Poppi 1997, pp. 34–37, 42–45). There are also similar indications in Alessandro's natural philosophy (Ellero 2006). It is worth noting that several of these trends, including an interpretation reconciling Aristotelian morals with Christianity and Platonism, had been offered at the end of the fifteenth century by the French scholar Jacques Lefèvre d'Étaples and his disciple Josse Clichtove (Bianchi 2013, pp. 140–143). Throughout at least the first half of the sixteenth century, French university professors would continue to treat happiness from both a theological and a philosophical perspective, emphasizing the overlaps between Christian and pagan views of happiness.

An influential English writer who significantly expanded the source-base of discussions of happiness (and moral philosophy more generally) was John Case (1540/1?–1600). Active in Oxford during the reign of Queen Elizabeth, Case approached philosophy from an Anglican perspective, but was nevertheless also open to Catholic currents and interpretations. His *Speculum questionum moralium* (1585), for instance, is close in various ways to Thomas Aquinas, and in its discussion of happiness holds that “only mental contemplation is complete beatitude” (Case 1997, p. 61). As a consequence, Case tends to place less emphasis than Aristotle does on the importance of earthly goods for happiness, although he does accept that “a moderate and modest amount of wealth” (*ibid.*, p. 63) is useful. Case's position is in any case again strongly eclectic, combining insights from Plato with his direct discussion of and questions on Aristotle's text (Lines and Kraye 2013, pp. 40–42).

Although the writers mentioned above generally dismissed Stoicism as a philosophy unsympathetic to the human condition (notable exceptions included the early works of Salutati and the Florentine philologist Angelo Poliziano), that movement experienced a revival in the second half of the sixteenth century (Kraye 1988, pp. 360–74, 2001; Poppi 2013, pp. 252–57). Among the main architects of the revived fortunes of Stoicism was the Flemish scholar Justus Lipsius (1547–1606), whose *Manuductio* or *Guide to Stoic Philosophy* (1604) was highly influential, as was his edition of Seneca's works the following year. Lipsius argued that Stoicism and Christianity are compatible, partly because both see virtue as being sufficient for happiness, regardless of pain and suffering (*Manuductio* II.20 and III.6; Lipsius 1997, pp. 203–207; Papy 2005). A similar enthusiasm for Stoicism was expressed by the Spanish author Francesco de Quevedo (1580–1645), although he went even further than Lipsius in trying to reconcile Stoic doctrines with Christianity and also, to some extent, with Epicureanism (Rothe 1965; Ettinghausen 1972; Lines and Kraye 2013, pp. 43–47).

Epicureanism also experienced a resurgence of sorts, although it was kept in check by Christian considerations (Kraye 1988, pp. 374–386; Poppi 2013, pp. 247–252). Francesco Filelfo already underlined the potentially positive role of pleasure in a letter to Bartolomeo Fracanzano of 1428 (Filelfo 1997). More important was Cosma Raimondi's letter (c. 1429?) to a certain Ambrogio Tignosi, in which he argued that “a man whose soul is in turmoil cannot be happy”; his focus on tranquillity led him to reject the views of happiness by Academics, Stoics, and Aristotelians (Raimondi 1997; Davies 1987). The Bolognese humanist Gian Battista Pio authored a commentary on Lucretius (1511), emphasizing the links between Epicureanism and the tranquillity of the contemplative life, thus betraying his inclination to mix Epicureanism with Stoicism (Tucker 2003, pp. 124, 147–148). This friendliness toward Epicurus was echoed by Francesco Vimercati, a later royal reader on ethics in Paris (Bianchi 2013, pp. 150–151). But the genuine Epicurean view of happiness generally attracted few whole-hearted adherents until the seventeenth century.

Among others, a question that received a new impulse in the Renaissance concerned the happiness of animals. In antiquity, happiness had usually been regarded as something pertaining to humans alone (although alternative views were put forward by Porphyry and Plutarch). Aristotle saw it as something closely linked to (though not identical with) the active exercise of virtue, and therefore beyond the ken of animals, who lack prudence. Augustine likewise saw it as an eminently human problem (*City of God*, XIX, 14), a point repeated by numerous commentators on Aristotle's *Nicomachean Ethics* (Muratori forthcoming). This position was perhaps voiced most clearly when people acting without virtue were described as beasts rather than humans. This point continued to be made in the Renaissance: indeed, it was a *topos* to view people pursuing pleasure alone as “beasts.” But at times there was some questioning of the human-animal boundary, particularly by Lorenzo Valla (Trinkaus 1970, pp. 132, 153, 203–205) and in the sixteenth century by vernacular writers such as Bernardo Segni, Ciarletta Caracciolo, and Giovan Battista Gelli.

These works reconsider the role of sensation in happiness and – particularly in the case of Gelli's rereading of Plutarch – seem to view true happiness as something attainable only by the few and most fully after death (Muratori forthcoming). One of the most original discussions of animal happiness is in Girolamo Cardano's *De subtilitate*, where he holds that animals (including flies) can be happy (Muratori 2016).

In the Renaissance, another point of debate was the relationship between individual and communal happiness, a matter that overlapped with the vigorous contemporary discussions on the merits of the active versus the contemplative life (Leinkauf 2017, I, pp. 624–27, 856–59) and the relative importance of ethics versus politics. Seen from the communal, rather than the individual, perspective, happiness was secured through morally superior rulers or lawgivers who could educate the youth to follow virtue (considered an essential ingredient for happiness, though not necessarily the only one). This Greco-Roman view, with its associated elitism (for only the more exalted classes could afford to offer their sons a training in virtue), finds at least partial reflection in utopias and other political works of the Renaissance, such as Francesco Patrizi's *La città felice* (1553), where however the author is very conscious that – for the reasons just given – only one part of the city is truly happy (Leinkauf 2017, I, pp. 905–09). In Machiavelli, of course, the relationship between personal virtue and communal well-being is even more complex.

Impact and Legacy

Generally speaking, the views of happiness outlined above tend not to identify happiness with a pleasurable emotional state (as we often do in modern parlance) or merely with the fulfillment of one's desires (unless those desires are clearly of the highest order, such as when one longs for God). To some extent, this perspective began to be challenged in early modern philosophy. René Descartes' moral philosophy is heavily influenced by Stoicism and tends to see happiness in psychological and emotional terms. Pierre

Gassendi espouses various elements of Epicurean philosophy and therefore of pleasure (although not of the merely sensual kind). Thomas Hobbes views felicity as “a continual progress of the desire,” in particular the “perpetual and restless desire of power after power” (*Leviathan*, Chap. 11; see White 2006, pp. 45–46). But other early modern philosophers – Gottfried Wilhelm Leibniz in particular – continued to have a view of happiness that was strongly influenced by Christian considerations (White 2006, pp. 100–102). White contends that, in early modern philosophy, “empirical and metaphysical-theological considerations were intricately mixed in many people’s thinking about happiness and pleasure” (White 2006, p. 104). Here one can see a powerful aspect of the legacy of earlier conceptions of happiness.

As to animals, this continues to be a topic of discussion well into the middle of the seventeenth century. Of particular interest is the position of the anonymous author of *Theophrastus redivivus* (1659), who depends on previous thinkers such as Cardano and Giulio Cesare Vanini and maintains that humans are even less likely to be happy than animals. The conclusion is arrived at by the kind of analysis of faculties of the soul that so interested early modern philosophers (Muratori 2016). One of these was Gassendi, who in his *Exercitationes* and *Syntagma philosophicum* concluded (in an anti-Aristotelian vein) that animals are rational too.

Finally, the relationship between individual and communal happiness continued to be pertinent for later thinkers. The utilitarian views of Jeremy Bentham and John Stuart Mill addressed the evaluation of the happiness of an individual versus that of the community, as they concluded that an important consideration is the happiness of the greater number (White 2006, pp. 55–74; Scarre 2001). Another related problem in early modern philosophy became that of moral obligation, particularly when this might seem to clash with individual happiness. White, following Sidgwick, does not see this as a potent problem within Christian thought, although there had been hints of such tension within Greek philosophy

(White 2006, pp. 120–128). From a strictly biblical perspective this may be true: Jesus stressed the two greatest commandments “Love the Lord thy God with all thy heart . . .” and “Love thy neighbour as thyself” (Matt. 22:37–39). The two were not to be separated (“On these two commandments hang all the law and the prophets”), and the New Testament in effect sees no conflict between faith (the tree) and outward works (its fruit). Yet part of the Renaissance debates about the main two or three ways of life had to do with the worth of civic and political (i.e., altruistic) action versus (potentially more self-fulfilling) contemplation (see entry “► [Cities and Urban Life, Renaissance](#)”). Thus early modern discussions of the issue may have been less original than they seem.

Harmony, Renaissance Conceptions of

Jacomien Prins

Centre for the Study of the Renaissance/Institute of Advanced Study, University of Warwick, IAS, Millburn House, Coventry, UK

Abstract

In music, “harmony” usually refers to two or more notes that simultaneously produce a pleasing sound. In ancient Greek music, however, from which the concept and term originate, “harmony” stands for a specific combination or juxtaposition of dissimilar or contrasting elements, for example, a higher and a lower note. By combining these disparate or conflicting elements, a unity or harmony arises (*discordia concors*, i.e., harmonious discord). In a narrower sense, the Greek science of harmonics refers to an extensively developed system of rules that governs relations between musical elements. These rules were intended to control consonance and dissonance, which are fundamental aspects of harmony. In a broader sense, “harmony” was used to explain unity and relationships in all kinds of natural and cultural phenomena by analogy with musical consonances and their proportions. These explanations together constitute the various theories of world harmony that were based on the Pythagorean-Platonic belief in a universe ordered by the same numerical proportions that produce musical consonances, or harmonies. The most powerful statement of this doctrine was found in the realm of cosmology, where the notion of the harmony of the spheres was used to designate the harmonious relationships between the planets governed by the proportionate speeds of their orbits or by their mutual

distances. In the history of Western thought, it was not so much the meaning of the term “harmony” that changed, but the material to which it was applied, resulting in ever-changing explanations of the concept in different cultural contexts.

Heritage and Rupture with the Tradition

In the frontispiece of his *Musurgia universalis* (1650), a classic in the tradition of the harmony of the spheres, Athanasius Kircher (1602–1680) introduces a scheme of world harmony representing a mixture of (neo)Pythagorean, (neo)Platonic, Jewish, and Christian elements, which had crept into this age-old tradition by then (Fig. 1). It depicts a harmonious cosmos, in which planets and angels together are singing the praises of the Creator. The triangle at the top with an eye inside represents the Trinity, which is surrounded by nine angelic choirs, each singing in four voices a 36-part canon by Romano Micheli, echoing the harmony inherent in all creation. The middle section is dominated by a globe of the world, upon which “Musica” is seated, holding the lyre of Apollo and the panpipes of Marsyas: two musical instruments whose ordered strings and pipes are often used as symbols for world harmony. The globe is encircled by the zodiac, indicating that just like the angelic music in the highest realm of the universe, the heavenly bodies of planets and stars make up a cosmic symphony. In this composition, the relationship between the orbits of the six planets (Sun, Venus, Mercury, Mars, Jupiter, Saturn) is expressible in terms of the whole tone and five consonances, which together constitute a musical scale (tone 9:8; third 5:4; fourth 4:3; fifth 3:2; sixth 5:3; and octave 2:1) without the dissonant musical intervals of the second and seventh.

In the bottom left-hand corner of the page sits Pythagoras, who proudly points out with his left hand that he is the discoverer of the secret of the numerical basis of musical harmony. This discovery was based on a comparison of the pitches made by hammers of different weights on an anvil in a blacksmith’s forge. By pointing with

Harmony, Renaissance Conceptions of, Fig. 1 World harmony. Frontispiece to the first volume of Athanasius Kircher’s *Musurgia universalis* (Rome, 1650) (Reproduced with kind permission of Glasgow University Library, Special Collections)

his right hand to his theorem about the mathematical law of triangles, Pythagoras illustrates here that a harmonic master plan underpins the structure and operation of the whole universe (*musica mundana*). The muse on the right may be Polymnia, who appears surrounded by musical instruments of various kinds. She personifies the view that through the imitation of world harmony in earthly music (*musica instrumentalis*) man is able to climb a spiritual ladder (bottom right-hand corner), which will ultimately lead to knowledge of the perfect harmony of God’s creation. This is the case because microcosmic man (*musica humana*), just like the macrocosm, is made in the image and likeness of God (Genesis 1:27).

In contrast with many of his predecessors, however, Kircher rejected the literal existence of

a music of the planetary spheres “for that which the ancients believed about harmonious order – that an audible harmony rose from the friction of the heavenly bodies – has been generally exploded in these most recent times; for neither the solidity of the heavens [i.e. the Aristotelian crystalline spheres] nor the order of the planets remains as the ancients disposed it” (Kircher 1650, II, 376, trans. Haar 1961, 504). As an admirer of Johannes Kepler, Kircher aimed at formulating his astronomical views not in superseded musical metaphors but in modern scientific terms, which, to his mind, were fully compatible with a Christian belief in the harmony of God’s creation. The sources he quoted in illustration of his view of world harmony include the classical treatment of the topic, as well as the most influential Neoplatonic and Christian interpretations, which will be discussed below.

Among these ancient Greek scholars, Plato (427–347 BCE) figures prominently as the first philosopher who formulated an all-encompassing view of the harmony of the universe. He was clearly inspired by early Pythagoreans, who had discovered that the sound of musical consonances was expressible in numbers, and extrapolated from this that the whole universe was ordered by the same numerical proportions that determine these consonances. In his commentary on Plato’s *Timaeus*, the Renaissance philosopher Marsilio Ficino (1433–1499) credited Pythagoras with having discovered that the principal musical consonances result from the sounding of proportionate weights of hammers or lengths of a stretched string, so that within the series 1,2,3,4 (the numbers constituting the “first figure of numbers,” i.e., the Pythagorean *tetractys*) simple ratios produce the musical intervals of the octave (2:1), fifth (3:2), and fourth (4:3) (Walker 1958; Prins 2014, 55–67). The key to understanding the whole universe lay for Plato and his commentators in these proportions, and particularly in the mathematical means found in multiples of the duple proportion (arithmetic mean = 2:3:4; geometric mean = 1:2:4; harmonic mean = 3:4:6). Scholars like Ficino based their world view on the discovery of musical laws underpinning the whole world, in which numbers were understood to be quantities with

spatial existence and symbolic value rather than abstractions. Ficino thus argued that Plato was right “that the duple and triple [proportions] and all the other intervals which are described in the first figure of numbers are found in the spheres” (Ficino 1496, 74^r, trans. Prins 2014, 54).

In his *Timaeus*, as Cornford (Plato 1937, 59–72) explains, Plato formulated a comprehensive Pythagorean view of the creation of the universe by the laws of harmony. In the cosmogonic myth included in the dialogue (at *Timaeus* 35 and 36) a Demiurge creates a World-Soul, a model for the physical universe, which is realized through the use of Pythagorean proportions. The World-Soul is envisioned as a band of invisible matter marked with the double and triple proportions of the geometric series, before being split and bent into circles that represent the structure of the planetary system, which resembles an armillary sphere. The structure of the World-Soul consists of Pythagorean proportions made up of the numbers 1-2-3-4-9-8-27, a compound of two geometric series (1-3-9-27 and 2-4-8), which taken together determine the harmony of the cosmos. In the Timaeian cosmogonic myth, Plato subsequently presents a musical scale that connects musical intervals with the spatial intervals between the planets. Within the two geometric series arithmetic and harmonic means are placed, which create proportions of 3:2, 4:3, and (their difference) 9:8. The proportion 4:3 (fourth) is filled in with two proportions of 9:8 (tone) and one of 256:243 (semitone). This results in a musical scale, which laid the foundation for the Greek science of harmonics, the tuning of which became known as the Pythagorean or Timaeian scale. Out of the invisible World-Soul material, the Demiurge then created the physical world, which was set into harmonious motion at the beginning of time and governed by the Demiurge, like a musician starting to play a musical instrument.

In the myth of Er (*Republic*, 617B4–7), moreover, Plato described the universe as a set of nested concentric rings around a spindle on the surface of each of which a Siren sits singing. According to this view, the movement of the planetary orbits (represented by the concentric rings) produces an audible harmonious sound that

consists of the single tones of the Sirens taken together. In the numerous commentaries on the myth, this planetary harmony was often interpreted literally as the music of the spheres (Plato 1937, 87–89). In principle, this heavenly music was audible to mortal human beings, but their souls and ears usually became completely deaf to it after incarnation in a human body. In the commentary tradition, these two Platonic myths offered not only a description of the harmonic structure of the world but also a normative philosophy of life, in which listening to and making music were seen as means to retrieve the music of the spheres. Ficino, for example, followed Plato in arguing that “man is born to contemplate heavenly phenomena or, rather, as far as it is in his power, to imitate the heavenly Mover himself. And what Plato had said about the sense of seeing he says about the sense of hearing as well: it is given to us for the sake of contemplation and learning; and also in order to enable us on the basis of audible harmony to bring the movements of our soul, too, into a harmonious order” (Ficino 1496, 77^v, trans. Prins 2014, 153).

Despite strong and persistent support enduring into the Renaissance for Aristotle’s rejection of a sonorous universe in favor of his own silent spheres (*On the Heavens*, ii.9), as noted by Haar (1973–4, 40), Plato’s ideas about world harmony continued to be influential and long-lasting, whether formulated in terms of harmonics or audible music (Prins and Vanhaelen 2017). These ideas were often read through the lens of sources such as Cicero’s (106–43 BCE) *Dream of Scipio*, which is a dream placed at the end of his *De republica* in direct imitation of Plato’s myth of Er. In his restatement of *musica mundana*, Gioseffo Zarlino (1517–1590), for example, quoted, in his *Institutioni harmoniche* (1558), the answer of Scipio Africanus the Elder, who is asked by the younger in Cicero’s *Dream of Scipio* to report his dream of cosmic harmony: “What is this sound, so loud and beautiful, which reached my ears?” Scipio the elder replies that “It is caused by the impulse and movement of the spheres themselves . . . distinguished by definite proportions. The high sounds mixed with low ones make different harmonies: for so great a motion could

not take place in silence. And Nature has arranged that the extremes of one end should sound low, those of the other end high. Therefore the highest circuit, that of the starry heaven, which has the fastest revolution moves with a higher and louder sound: and the lowest, lunar, one with the deepest sound” (Zarlino 1558, 16, trans. Godwin 1993, 206). Given the universal law of *discordia concors*, the sound of the spheres is presented here as a harmony of carefully proportioned intervals, there being seven tones in all. These seven planetary tones were equated by Macrobius (1952, fl. c. 400) in his *Commentary on the Dream of Scipio* and later commentators such as Zarlino with the seven numbers of Plato’s geometric series in the *Timaeus*.

Macrobius’s cosmic scale was based on daily planetary motion and ascribes the lowest tone to the Moon with the other planets following in order. Within the tradition of the harmony of the spheres, it was juxtaposed with the opposite one of Nicomachus of Gerasa (c. 60–120), which is based on annual planetary motion and ascribes the lowest tone to Saturn. Like the majority of Renaissance scholars, Ficino discussed these two cosmic scales, but he could not make a definitive choice between them, because, to his mind, the tones of a single scale would reduce the mighty polyphony of the planetary spheres. He was convinced that “we will find that low tones in the heavens are mixed with high [tones], and that the same spheres give out a high tone by the one motion and a low tone by the other, [because] from multiple revolutions are generated tones in an equal multiple proportion” (Ficino 1496, 72^r, trans. Prins 2014, 107). Ficino continued to believe strongly in the existence of a musical universe, yet, instead of the precise nature of the cosmic scale (*musica mundana*), he was far more interested in the concept of *musica humana*, the harmonious makeup and working of the human body and soul and their interaction, and for this purpose, he consulted various sources, including medieval Arab theories about the healing and harmonizing powers of music.

Already in Ptolemy’s (fl. 127–148) *Harmonics*, a distinction was made between cosmic and psychic harmony. This subdivision of “harmony” was

further developed by Boethius (c. 480–525) into *musica mundana*, *humana*, and *instrumentalis*, the latter referring to music played and sung by men on earth (Boethius 1989, Hammerstein 1962, 116–144). Till the end of the Renaissance, this subdivision of the science and art of music was used in academic circles. Yet, the medieval study of music as a branch of the Quadrivium, which was primarily the study of harmonics, that is, of the definitions of musical consonances in terms of their numerical proportions, was criticized by Renaissance Neoplatonists as being too scholastic and too remote from ancient Greek musical reality, which they sought to revive.

For this purpose, these Renaissance scholars consulted sources such as Aristides Quintilianus's (late third–early fourth century) *On Music*, which provided a cosmic explanation of the musical sensitivity of the human soul and body and the role of music in education, not only in childhood but throughout life. During the Middle Ages, the treatise was already regarded by Byzantine and Arab scholars as a basic work, but its importance was generally acknowledged by Renaissance scholars. Man's growth, bodily proportions, and behavior were envisioned by Aristides as a microcosmic mirror of the macrocosm. Everything in a human life, from the proportions of man's body and soul and their interaction, through the human life cycle, until the development of human character and behavior was perceived as governed by analogy with, or dependence upon, celestial harmony (Gersh 1996, 268–273). Aristides formulated his answer to the question of “what coerces the [human] soul to be so readily conquered by melody played on instruments” (Aristides Quintilianus 1983, 151–157) in terms of the Neoplatonic theory of the soul's descent through the planetary spheres before its incarnation at the birth of a human being: “going through the ethereal orbits [of the planetary spheres], the soul partakes of everything so far as it is luminous and adapted for warming and naturally enclosing the body, plaiting certain bonds from these orbits for itself as a sort of latticework by irregular movement of the reciprocal lines among the movement themselves. . . . This is the root of the body, and this they named ‘harmonia.’” This kind of “harmony”

not only explains the influence of the heavenly bodies on a human being, but also formulates the purpose of a human life: during its life on earth, the soul has to strive for a recollection of the heavenly harmony that it heard when it dwelt in heaven and fell through the spheres before becoming embodied. The individual must then draw upon this memory to create a better life for himself and his fellow human beings.

We encounter a similar conception of *musica humana* in many Renaissance sources, for example, in an illustration of harmonious man by the hand of the Limbourg Brothers (Fig. 2). Man is defined here in terms of a harmonious discord (*discordia concors*): composed of the frontal feminine blond figure and the masculine dark figure seen from the back. According to the comments inscribed in the corners of this picture, humanity can be divided into several different categories, which are based on different temperaments, that is, different compositions of the four humors and their elemental qualities: choleric (fire), sanguine (air), phlegmatic (water), and melancholic (earth). Man may be further categorized in relation to the cardinal zodiacal points, which correspond to particular parts of the body and soul. Combinations of these criteria result in four types of people according to their astrological indications: men born under the sign of Aries, Leo, and Sagittarius are hot and dry, choleric, masculine, and oriental; those born under Taurus, Virgo, and Capricorn are cold and dry, melancholic, feminine, and occidental; those of the sign of Gemini, Aquarius, and Libra are hot and wet, masculine, sanguine, and meridional; while those of Cancer, Scorpio, and Pisces, finally, are cold and wet, phlegmatic, feminine, and nordic.

Ficino's innovative restatement of the doctrine of world harmony is colored by these kinds of astrological ideas about harmony. In his interpretation, the correspondences between different parts of the macrocosm and man were conceptualized in terms of an analogy to musical strings and their vibrations. In order to update the medieval idea of static harmonies produced by the revolutions or distances of the planetary orbs, Ficino used the concept of cosmic sympathetic vibration to account for an ever-changing

Harmonious man. In: The Limbourg Brothers, *Très Riches Heures du Duc de Berry* (1400–1416), MS 65, fol. 14v (Reproduced with kind permission of the Musée Condé, Chantilly)

Ficino's idea of man as cocreator of his own harmonic nature is also in line with a conception of human freedom that emerged during the Renaissance. Giovanni Pico della Mirandola (1463–1494) gave voice to this idea in his *Oration on the Dignity of Man* (1486), where he argued that man with his free will stood apart from the

great chain of being, was given the ability to distinguish between good and bad, and thus to a certain extent was free to choose an edifying harmonious life. Ficino and Pico did not believe that man's destiny was determined for him by his stars but were interested in the question of how man can discover the influence of heavenly bodies on his life. They wanted to employ this knowledge, moreover, to counteract this celestial influence or to use it for the purpose of becoming a more harmonious being. Ficino exploited the scientific possibilities implicit in astrology to the full and employed them in the context of musical ceremonies, which were organized with the purpose of drawing down cosmic harmonizing influences to better life on earth (Ficino 1989, 354–363).

In summary, one of the major Renaissance transformations of the tradition of the harmony of the spheres was the closure of the gap between theories of the harmony of the world and ideas of music's ethical power to affect man's body and soul, via ancient Greek and medieval Islamic writings, which humanists sought to revive (Haar 1961, 328–495; Tomlinson 1993, 67–100). But the aspects of astrology and magic that were necessary to close this gap were not appreciated by all scholars interested in world harmony. Even though there was no real distinction between world harmony and astrology for ancient Neoplatonic, medieval Arabic writers and their Renaissance followers, philosophers such as Marin Mersenne (1588–1648) thought that astrological and magical beliefs threatened the established Christian scholarly belief in the creation of a harmonious world.

Ficino had argued that music produces certain effects on an individual, depending on the constellations with which he was associated, i.e., his horoscope, but Mersenne totally rejected this idea in his *Quaestiones celeberrimae in Genesim* (1623; *Most Frequently asked Questions about Genesis*) (which he wrote before his famous *Harmonie universelle* [1636]) and warned: "He who composes music in the likeness of the heavens will never succeed in restraining madness, either because there are no [harmonies] in the heavens or because, granted there be some, they could never be apprehended by us"

(Mersenne 1623, 1704; transl. Haar 1961, 501). This reaction is symptomatic of the emergence of a new musical reality in which beauty and the complementary idea of celestial harmony were gradually replaced by concepts of expressivity and emotion. This transformation into a form of idealism that is ontologically more subjective than original Pythagorean and Platonic conceptions of "harmony" is expressed clearly in Mersenne's dismissal of Ficino's astrological interpretation of world harmony: "It is completely objectionable that any kind of influence has been drawn down from the stars by singing, for a particular song does not evoke sadness or happiness in us because it is performed under a particular star, as is indicated by the fact that the same song has the same power when heard under various constellations, as experience will confirm" (Mersenne 1623, 1705, my trans.).

Alongside ancient Greek theories, Jewish and Christian beliefs in a harmonious universe shaped Renaissance conceptions of "harmony." As noted by Hammerstein (1962, 119–121) and Gersh (1996, 21–27), for Church Fathers such as Augustine (354–430), Pythagorean and Neoplatonic beliefs could be adopted as long as they were reconcilable with biblical passages concerning the harmony of God's creation. In order to be able to make full use of the Pythagorean doctrine of perfect harmony, Renaissance scholars such as Ficino, Pico, Francesco Giorgi (1466–1540), and Francesco Patrizi (1529–1597) used the narrative of a *prisca theologia* or *pia philosophia*. According to this belief, a single, true, primordial wisdom-religion, which passes through all religions and philosophies, was given by God to enlightened men such as Zoroaster, Hermes Trismegistus, Orpheus, Pythagoras, Plato, and Moses. This narrative enabled scholars to use pagan texts such as Plato's *Timaeus* to explain vague and obscure passages in the biblical creation story. Pico, for example, drew on sources from the tradition of the harmony of the spheres to demonstrate the universal truth of some of his Pythagorean conclusions, such as "6. The three-fold proportion – Arithmetical, Geometrical, and Harmonic – represents to us the three daughters of Themis [i.e. divine universal law], being the

symbols of judgment, justice, and peace” (Pico 1486, 48, trans. Godwin 1993, 176).

Jewish, Gnostic, and Christian belief in the angelic habitation of the universe, originating from ideas about angelic hierarchies in sources such as Pseudo-Dionysius’s *On the Celestial Hierarchy* (c. late fifth century), led to a belief in a *musica coelestis*, angels in heaven making music in praise of God (Hammerstein 1962, 116–119; Gersh 1996, 199–201). These kinds of ideas of heavenly harmony persisted even in the later Middle Ages, when Pythagorean thinking had to make way in academic circles for Aristotelian thought. Giorgio Anselmi (c. 1386–1440/3), presumably inspired by Dante, formulated an innovative view of *musica celestis* in which a static music of the spheres produced by the individual tones of a musical scale was developed into a dynamic symphony of planetary harmony and angelic song: “The tireless soul of the whole world, indeed, sings with the same [harmony] its ceaseless praises to the eternal, most high and all-beneficent Governor by means of the celestial motions, with which the holy throngs of blessed spirits, sweetly echoing, contend in song and in the ineffable beauty of their rivalling hymns” (Anselmi 1961, 97, trans. Godwin 1993, 146). Even though serious earthly music was seen as an echo of this heavenly harmony, it could be best perceived in moments of ecstasy or divine enlightenment as experienced by St. Cecilia, who is captured by Raphael in a moment of transcendence of the world of broken and unstrung musical instruments (Fig. 3).

Francesco Giorgi, whose knowledge of Pythagorean harmonic proportions was called upon when he was asked for advice on the harmonic proportions for the new church of San Francesco della Vigna in Venice, extended the doctrine of world harmony with Cabbalistic ideas, in which a Christianized form underpins his *Harmonia mundi* (1525). In this enormous work on world harmony, Giorgi dealt with the harmony of the whole creation in terms of the ten “Sefirot,” i.e., attributes through which God manifests himself by emanation in his creation. Giorgi applied Platonic and Cabbalistic number symbolism to this restatement of the doctrine of

Harmony, Renaissance Conceptions of,
Fig. 3 Raphael, *The Ecstasy of St. Cecilia* (c. 1515–1516) (Reproduced with kind permission of the photographic archive of the Pinacoteca Nazionale, Bologna)

perfect harmony, writing in effect a wide-ranging commentary on the biblical creation story. This book in itself was meant to be an echo of the harmony of God’s creation, and the purpose behind the enterprise of writing and reading it was to be reunited with God.

Giorgi, for example, argued along the lines of the *prisca theologia* that Ezekiel, when he wrote that the biblical sentence “The spirit of life was in the wheels” [Ezekiel 1:20] could be understood through the lens of the Timaeon narrative of creation, equating the wheels with the harmonious spheres. Self-knowledge, furthermore, could also lead to insight into God’s archetypal harmony, because: “Man, as the most perfect image of the world, contains all those things which one finds in the macrocosm in the same proportion. . . . In the

human intellect ... one finds a purer order of simpler numbers which corresponds to the nine choirs of angels and to the nine higher *sefirot* [i.e. divine attributes], so that there is within it the whole image of the Angels and of God" (Zorzi [=Giorgi], 2010, 536, my trans.). Giorgi was convinced that due to the divine spark in man's soul, he was capable of knowing world harmony; but the Inquisition was of the opinion that he made man too harmonious and divine, as a result of which Giorgi's occult and mystical work was placed on the *Index of Forbidden Books*.

The concept of "harmony" continued to be elaborated in the late sixteenth and seventeenth centuries by Neoplatonic philosophers, theologians, astronomers, astrologers, physicians, music theorists, architects, and poets. In the discipline of music theory, the tuning system outlined in the *Timaeus* became the subject of debate during this period, because it was incompatible with tuning and temperament as used in musical practices. Ficino's *Timaeus* commentary, for example, already evinces a certain awareness of the problem that what started in the Timaeian myth of creation as a system of consonances involving only small whole numbers turns out to be less simple when applied to Renaissance musical performance practice. During the course of the fifteenth century, polyphonic music had started to develop, and in addition to the harmonic use of octaves (2:1), fifths (3:2), and fourths (4:3) – hitherto, the only harmonic intervals generally defined in a music-theoretical treatise – there was a gradual adoption of thirds (81:64) and sixths (27:16), which involve relatively large numbers. The use of these intervals dictated a modification of the Pythagorean tuning in which the major third (81:64) became slightly flattened to 80:64, or 5:4, and the major sixth also became slightly flattened, from 27:16 to 25:15, or 5:3. At the same time, the fourth as a harmonic interval experienced devaluation. These changes were reflected in the musical thought of Ficino's *Timaeus* commentary: while the octave and fifth are still defined as primary consonances, Ficino observed that the fourth "in the sense of hearing is not appreciated as a consonance in its own right." In addition, he recognized the third and the sixth as primary consonances, which, in his opinion, were

present in the diatonic scale to temper "with their more delicate sweetness" the dissonance of the second and seventh tones of the scale" (Ficino 1496, 71^v, trans. Prins 2014, 65).

During the Renaissance, different attempts were undertaken to update the Pythagorean tuning system, inspired by the desire to defend the very foundation of the belief in a harmonic creation. The structural problem that the musical intervals of the Pythagorean tuning system did not quite add up, however, became more and more pressing. The difficulty arises in the relationship between octaves and fifths: 8 octaves do not equal 12 fifths. The series of fifths results in a note which is a little bit higher than the note produced by the octave series, a mathematical difference which is defined as the Pythagorean comma. After Ficino, Zarlino tried to solve this problem by replacing the Pythagorean scale with a new system called just intonation, which attempts to rectify the deficiency of the Pythagorean scale by founding itself upon both pure fifths (3:2) and pure major (5:4) and minor (5:3) thirds. In his *Istitutioni harmoniche* (1558), Zarlino expressed the belief that this adaptation was fully in accord with the Holy Scripture: "as when the Lord speaks to Job, saying: 'Who will tell of your ordinances, O voices of the heavens? And who will make their music sleep?' [Job 38: 137]" (Zarlino 1558, 16, trans. Godwin 1993, 207). Zarlino did whatever it takes to keep "the music of the voice of the heavens" awake in order not to lose the cosmological significance of earthly music. All arguments against the notion of an inaudible music of the spheres were countered by an appeal to reason, which for him as a rationalist was ranked higher than the sense of hearing. But this led to a vehement dispute with Vincenzo Galilei (1520–1591), who demonstrated in his *Discorso intorno alle opera di Gioseffo Zarlino* (1589) that the Pythagorean belief in the expressibility of musical sound in terms of simple numerical proportions was wrong. Galilei decided to repeat the experiments that Pythagoras was supposed to have conducted at home after his discovery of the musical intervals in the smithy (Walker 1978, 23–26). In order to test his hypothesis, as is reported in various sources, Pythagoras tied weights to strings of equal length and found in

the musical tones this produces the same simple numerical proportions that had been revealed in his original discovery with hammers of different sizes: the octave being 2:1, the fifth 3:2 and the fourth 4:3. Based on a repetition of this experiment, Galilei revealed that this was incorrect: in order to get these results, the weights tied to the strings must be in squared, not simple, inverse proportion to the string lengths. Thus, to create the octave-fifth-fourth series, the weight-string relationship would need to be, respectively, 4:1, 9:4, and 16:9; the squares of the simple numbers of Pythagoras's discovery.

In Girolamo Cardano's (1501–1575) account of the sense of hearing, a new concept of harmony emerged which was more subjective than the original doctrine of Pythagorean harmony. Even though he stressed the importance of Pythagorean proportion to distinguish between consonance and dissonance in the sense of hearing, he complemented his definition with far more subjective criteria. Whether we enjoy a harmony or consonance not only depended on its perfect proportions but also on the context within which it was presented to us, because “better things are always pleasing after worse ones, . . . so light pleases after darkness, sweetness after bitterness, oil of roses after dill, and consonant tones after dissonances” (Cardano 1966, III, 572, trans. Miller, 1973, 212).

The debate about the status of Pythagorean proportions also played a role in the context of the philosophy of nature, with far-reaching consequences for arithmetic-driven accounts of harmony (Palisca 1985, Vendrix 2008). For instance, the Italian philosopher Francesco Patrizi argued in his *Nova de universis philosophia* (1591) that the Pythagorean belief that numbers are the ultimate constituents of reality, which is the very foundation of the Pythagorean doctrine of world harmony, was nothing but superstition: “The Ancients based themselves on divination rather than knowing the cause.” As a corrective to these ancient unscientific beliefs about numbers, Patrizi argued that “Continuous quantity [i.e. lines] exists by nature, while [the discrete quantity of] number is the work of the human mind” (Patrizi 1591, 68^r, trans. Prins 2014, 243). Hence, a philosophy of nature, which includes the natural phenomena of sound, could not be based on numbers, because these were

merely conventional constructs. As a consequence, Patrizi abandoned the Pythagorean belief that the universe was ordered by numerical proportions that produce harmonies in earthly music from his philosophy of nature.

During the Renaissance, occasional attempts were undertaken to imitate angelic songs or planetary harmony in earthly music. Apart from some remarks of a few initiates who witnessed Ficino's improvised musico-magical practices, regrettably, they left no material trace. Yet a number of polyphonic compositions similar to the 36-part canon by Romano Micheli (used in Kircher's frontispiece, Fig. 1) survive in print, as does the tableau *L'armonia delle sfere*, which was designed for the Florentine *intermedi* of 1589 – a rendering of Plato's myth of Er – and Stefano Landi's religious opera *San Alessio* (1634).

Other aspects of Renaissance culture were also influenced by the Pythagorean doctrine of “harmony,” however. The use of harmonious proportions in ideas about the architecture of Leon Battista Alberti (1404–1472) and Andrea Palladio (1508–1580) was fully consistent with the rediscovery of Pythagorean proportions and their sixteenth-century music-theoretical adaptation mentioned above. Just like in music, according to Rudolf Wittkower (1949/1973, 142–154), this development ultimately culminated in a break from the laws of harmonic proportion in favor of a subjective concept of beauty based on the newly discovered laws of perception, already formulated by scholars such as Cardano.

Although a literal belief in the existence of the harmony of the spheres was jeopardized from the sixteenth century onwards by new ideas about the cosmos, man and music, restatements of the belief in world harmony continued to appear. Universal harmony was described in seventeenth-century Italian, French, and especially English poetry, where the evocations of celestial harmony, in the words of John Hollander became “decorative metaphor and mere turns of wit” (Hollander 1961, 19). Yet, ideas from the tradition of the harmony of the spheres, such as the poet as maker of a harmonious microcosm continued to flourish (Heninger 1974, 287–324).

These metaphorical restatements of Pythagorean harmony were paired with drastic revisions

in the field of cosmology, where Johannes Kepler (1571–1630) argued in his *Harmonices mundi* (1619), further developing Ptolemy's view of world harmony, that not only the Pythagorean tuning of the *Timaeus* scale, but that the whole notion of world harmony had to be updated in line with the emerging view of a heliocentric world view (Spitzer 1963; Walker 1978, 34–62). Replacing the earth with the sun meant that the planetary distances and revolutions needed to be revised in a drastic way to save the notion of world harmony. As a solution, Kepler defined the intervals between the Copernican planetary spheres by the five regular solids of Greek geometry and found these new harmonic proportions expressible in the musical terms of an old-fashioned contrapuntal composition, in which the different voices symbolize the movements of the planets which are orbiting the sun.

Like Ficino before him, who in a variation on the dream of Scipio in the form of a letter inspired a political leader of his day to use the doctrine of heavenly harmony as a model for his form of government, Kepler was also convinced that harmony in nature should be used as a point of departure to create a harmonious society. Yet, while he first saw in harmonious nature a coherent unity that might be mimicked in an earthly society adopting one truth, he later emphasized the peaceful and harmonious coexistence of diverse perspectives (Rothman 2012, 18 and 342).

In sharp contrast with the innovative ideas of his contemporary Kepler, Robert Fludd (1574–1637) continued to defend in his *Utriusque cosm... historia* (1617) the absolute truth of the Ptolemaic geocentric view of world harmony. Finally, Athanasius Kircher's *Musurgia universalis* (1650), with which this entry began, was the last great summation of the wide-ranging ideas about "harmony" discussed above, before the subject went into oblivion as a universal theory.

Abstract

A political theorist, James Harrington expressed his ideas in his *The Commonwealth of Oceana* (1656), a constitutional utopia through which he drafted institutional and political principles meant to guarantee social and political stability. According to Harrington, political systems are somehow dependent on the distribution of property among people, and if property is in the hands of the many, stability will thus require a republican form of government. Harrington aspiration was to set up the principles of a new "art of lawgiving"

based on the equal and balanced distribution of property, orders, and offices that is deemed to be the true reason of the states.

Biography

A political theorist, James Harrington was born in 1611 in Upton, Northamptonshire, the oldest son and heir of Sir Sapcotes Harrington. Little is known of his life and very few of his papers and documents are left. We can only rely upon the accounts of his life written by John Aubrey, Anthony Wood, and John Toland. In 1629, Harrington entered Trinity College, Oxford, but left 2 years later with no degree. For a short time, he also entered the Middle Temple but he found himself uncomfortable with the study of law. He travelled on the continent, visiting the Netherlands, Denmark, Germany, France, Switzerland, and Italy. In 1635, he returned to England, upholding republican ideals and Protestantism. Between 1646 and 1649, he served as a gentleman attendant for Charles I, for whom he felt a sincere friendship. Harrington played no significant role during the Civil Wars and the Revolution, and his intellectual and political activities were later devoted to sustaining a stable, namely “equal and balanced,” republican commonwealth. All of his political works were published between 1656 and 1660; among them, the most important is *The Commonwealth of Oceana* (1656), a constitutional utopia through which he expressed his political ideas and drafted institutional and political principles meant to guarantee social and political stability. Later political works represent the attempt to highlight and clarify the principles expressed in *Oceana*, and had a significant impact on the republican debate during the Protectorate and immediately before the Restoration. With the return of the Stuarts, James Harrington was arrested on a charge of conspiring against the government and was jailed in the Tower. Due to the imprisonment, his mental and physical health was greatly weakened. From his release until his death in 1677, he seems to have had no significant

public life. His intellectual activity almost stopped and probably his last effort is the drafting of a treatise of natural philosophy titled *Mechanics of Nature*. A collection of his works was edited in 1699, by John Toland, who could use the writings, papers, and documents in the hands of Elizabeth Ashton, Harrington’s sister.

Political Theory

In the opening lines of his *Commonwealth of Oceana*, Harrington opposes “ancient prudence,” the virtuous knowledge of politics and civic life established in ancient Greece, Rome, and Israel, and “modern prudence,” or “Gothic balance,” the feudal politics based on kingship and aristocracy. The former is the “art whereby a civil society of men is instituted and preserved upon the foundation of common right and interest” (Harrington 1977, 401), while the latter is the rule of one man, or of the few, according to his or their interest. According to Harrington, political systems are somehow dependent on the distribution of property among the people and if property is in the hands of the many, stability will thus require a republican form of government. The political confusions in England are in fact the result of the unbalance between the distribution of property and the political superstructure. In his works, Harrington thus proposed establishing an agrarian law, meant to keep a balance in the distribution of property and thus, preserve the stability of the republic and keep a strong citizen army, necessary to defend the new commonwealth. However, institutions have their own principles and Harrington supported a bicameral legislature, with the representatives being elected by all “who lived off their own” through a secret ballot. In order to set up a balanced political system, Harrington is also convinced that offices must ordinarily rotate. Harrington’s aspiration was therefore to set up the principles of a new “art of lawgiving” based on the equal and balanced distribution of property, orders, and offices. This knowledge is deemed to represent the true *raison d’être* of the states.

Harriot, Thomas

Born: ca. 1560, Oxford (?)

Died: 2 July 1621, London.

Matthias Schemmel

Max Planck Institute for the History of Science,
Berlin, Germany

Abstract

Harriot was an English mathematician and philosopher working in diverse fields of contemporary knowledge such as algebra, astronomy, navigation, cartography, architecture, mechanics, optics, alchemy, linguistics, and biblical chronology. Besides a small book on the New Found Land of Virginia and a posthumously edited work on algebra, his work is handed down to us solely in the form of about 5,200 sheets of working notes, a fact that complicates the appraisal of his achievements.

Synonyms

[Harriot, Thomas](#); [Harriott, Thomas](#)

Biography

The earliest item of the incomplete record of Harriot's life is an entry in the matriculation register of Oxford University, where he, the son of a commoner, began his studies at the age of 17. Sometime after his graduation in 1580, he entered the service of Walter Raleigh for whom he worked as a scientific advisor, working, among other things, on problems of navigation. In 1585, he joined Raleigh's expedition to the New World where he studied the language and habits of the native Algonquians as well as the local geography, flora, and fauna. After his return to Europe in 1586, he spent some time in Ireland, where he was again charged with surveying and map-making. In

the 1590s, Harriot acquired the patronage of Henry Percy, Ninth Earl of Northumberland, and moved into Syon House on the Thames, where he had his own laboratory and library. In 1621 he died from a nasal ulcer. In the final decades of his life, Harriot's social position was precarious. From the first years of the seventeenth century on and up to the years around his death, both his patrons were imprisoned. Harriot himself was accused of atheism several times and was imprisoned for a couple of weeks in the aftermath of the Gunpowder Plot of 1605.

Heritage and Rupture with the Tradition

Harriot was one of the early modern engineerscientists in whose work, as in Galileo's, there is a confluence of traditions of practical mathematics and ancient and medieval (natural) philosophy. The integration of a growing body of practical knowledge eventually leads to ruptures within the philosophical tradition. Thus, based on geometrical diagrams and using his own elaborate algebraic formalism, Harriot developed a theory describing the collision of round bodies and claimed that it was "among the principal elements which lead to the understanding of the inner secrets and mysteries of natural philosophy," obviously subscribing to an atomistic agenda and explicitly breaking with Aristotelianism. Correspondingly, Harriot's astronomical work is known to have been informed by Copernicanism.

Innovative and Original Aspects

The confluence of practical and theoretical traditions implied the use of experiments and mathematics in the systematic treatment of questions of philosophy. Harriot was highly innovative in this context and arrived at many results which were later independently obtained and published by others. Thus, in mechanics, he performed fall experiments and arrived at the law of fall and the insight into the parabolic shape of projectile trajectories. He performed optical experiments and arrived at the law of refraction, today known as Snel's law. He constructed telescopes

independently of and prior to Galileo and used them to observe the moon and the sunspots. He made original contributions to algebra and number theory and invented one of the earliest systematic phonetic alphabets.

Impact and Legacy

While, in his lifetime, Harriot was widely known in England and also on the continent, as his correspondence with Kepler testifies, his failure to publish made him virtually vanish from the later history of science. It is therefore up to modern historians to reconstruct his work from his manuscripts and use it as a means to probe into the field of early modern knowledge and its developmental dynamics.

Hartlib, Samuel

Born: 1596–1600, Elbing (Elbląg) (Prussia, Kingdom of Poland)

Died: 10 March 1662, Westminster, London

Andrea Strazzoni

Dipartimento di Antichistica, Lingue, Educazione e Filosofia (A.L.E.F.), Università degli Studi di Parma, Parma, Italy

National Research University Higher School of Economics, Moscow, Russia

Gotha Research Centre, University and Research Library, Erfurt/Gotha, Germany

Abstract

The main aim of Samuel Hartlib was to provide an advancement of learning finalized to the amelioration of the material conditions of men and the pursuit of a religious peace, i.e., the unification of the Protestants. To this aim, inspired by Comenius, he devoted his efforts or gathering knowledge by the creation of a society or office of learned men (in technical fields, philosophy, and theology), and by the establishment of a network of correspondents (the Hartlib Circle). The method of discovery underlying his program of advancement of learning was inspired by Bacon's *Novum Organum* and by Jacopo Aconcio's method of analysis, while the categorization and

transmission of knowledge had to be based on commonplace books and artificial languages. His plan of economic improvement, to be fulfilled mainly through the amelioration of husbandry, was motivated by the Puritan Millenarianism to which he adhered.

Alternate Names

[Gartlib, Samuel](#); [Hartlibius, Samuel](#); [Hartlieb, Samuel](#)

Biography

The life of Hartlib is documented mostly by his letters and papers, rediscovered in 1933 (Turnbull 1947; HP). He was born in Elbing around 1600 to a German royal merchant and a half-English woman, whose father was a deputy of the English Company of trade in the Baltic. Hartlib was educated in Brzeg (Silesia) probably until 1621, although in 1614 he matriculated at the University of Königsberg (Turnbull 1920, 5). Between 1621 and 1626 he was in England, where he studied in Cambridge under John Preston. He settled in London from 1628 (Turnbull 1947, 11–15, 34; Dickson 1998, 146), likely under the suggestion of John Dury, minister in Elbing between 1625 and 1630, as part of his efforts to reconcile the Protestants (Turnbull 1920, 7–13). Moreover, he moved to England as a consequence of the Hapsburg and Catholic conquest of the region of Elbing (Trevor-Roper 1967, 231–234). In England Hartlib pursued a program of reform of learning by establishing a school in Chichester, although unsuccessfully (Hartlib 1630). Moreover, he developed a program of reform of all knowledge, having been acquainted with Comenius's *Janua linguarum* (1631) and with the draft of the *Pansophia*, which he published in 1637 and 1639 (Hartlib 1637, 1639; Webster 1970a, 22–25; Čapková 1994, 80–85). This program was the outcome of a movement of reform set by Ramus, Keckermann, and Alsted (Hotson 1994, 2011) and served both the advancement of learning and religious peace (Clucas 1991; Houston 2014, 124–131). To these aims, Hartlib first

envisaged the creation of a “Societas Reformatorem et Correspondency” (1634) - (Dickson 1998, 148–158), and then (together with Dury) of an “Office of Public Address in Spiritual and Temporal matters,” i.e., an institute intended to the gathering of information and to the accomplishment of Bacon’s and Comenius’s scientific and educational programs (Hartlib 1647, 1648; Slack 2015, 102–116). Moreover, he devoted some short treatises to the attempts of unifying the Protestants (Hartlib 1641, 1643) and to recollections of others essays, mainly on husbandry. In developing his project of gathering knowledge, Hartlib the “intelligencer” came to form a Circle, primarily constituted by himself, Dury, and Comenius (Trevor-Roper 1967, 219–271), and involving several experts with whom Hartlib corresponded around 4,718 letters (EMLO). The Hartlib Circle included Robert Boyle, Gabriel Plattes (author of the Utopian dialogue *Macaria*, 1641, 2013), William Petty, John Milton, Theodore Haak, and Henry Oldenburg. Members of the Circle formed in 1646–1647 the “Invisible College” that would later inspire the birth of the Royal Society, although Hartlib did not establish or set the program of either (Turnbull 1953; Webster 1974, 1975, 58). For his writing and projects, he spent all his provisions and obtained from the Government of the Commonwealth a pension in 1647. Still, he died in needy conditions in 1662 (Turnbull 1920, 48–51, 62).

Innovative Aspects and Influences

Hartlib’s program of reform consisted of (1) the gathering of information and observations, and (2) their categorization into a unique body of knowledge (*pansophia*) (Clucas 1991, 35). This program relied on the methodology expounded in Bacon’s *Novum Organum*, in which Hartlib opposes the “systematic” approach of Cartesian and Scholastic philosophy (Yeo 2010, 188–194), and on Jacopo Aconcio’s method, consisting of the analysis of notions and facts as the main source of knowledge in science and religion (Clucas 1994, 58–62). Moreover, Hartlib’s program required a method of teaching, learning, and

transmitting knowledge: accordingly, he appropriated the method of epitomization of John Harrison (Clucas 1994, 64–68; Yeo 2007, 2010) and recommended the use of summaries and commonplace as the most viable means in learning and disseminating knowledge (Hartlib 1654). This method, which in Hartlib’s plans had to be taught to children in order to enhance their memory, would inspire William Petty’s pedagogy (Petty 1647; Yeo 2007, 11–17 and 2010, 190–191). Moreover, Hartlib promoted the use of artificial languages and availed the system of abbreviations of George Dalgarno (Slaughter 1982, 104–116, 120–122; Strasser 1994; Lewis 2005).

Hartlib’s program was aimed to practice: first and foremost, husbandry, as testified to by his collections of technical essays (Hartlib 1651a, b, 1653a, b, 1655, 1659) and by Plattes’s *Macaria* (Webster 1972), expounding advice for the economic improvement of England. Moreover, Hartlib supported the reform of teaching by the creation of new academies centred on technical disciplines, such as those that one can find in John Milton’s *Of Education* (Milton 1644; Raylor 1993, 2010). Husbandry was central to Hartlib’s interests as it allowed him to put into practice his Baconian method; moreover, it was a means for understanding nature, as husbandry was based on the knowledge of alchemical elements (Hartlib 1652; Matei 2012, 2013; Houston 2014, 129–132). Also, it served to the transformation of the world. That was a main ideal of Puritanism, to which Hartlib adhered (Jue 2006, 67–68). In his views, the amelioration of the world would lead to the fulfilment of the providential plan of God and to the beginning of the Millennium (Hartlib 1651c; Webster 1979; Mulsow 2001; Jue 2006, 77–84; Matei 2011; Houston 2014, 125–126). Hartlib even sponsored colonial programs as part of his project, such as those of the Huguenots Hugh L’Amy and Peter Le Pruvost (Irving 2008, 47–68; Leng 2009).

Abstract

The natural philosopher William Harvey was born in Folkestone on April 1, 1578. He studied at the Gonville and Caius College in Cambridge, and from 1597 he focused his attention on medicine. In 1599 he moved to the University of Padua, where he was enrolled in Medicine. After his graduation on April 25, 1602, he came back to London and obtained the acknowledgment of the title and the professional license in Cambridge. In 1607 he was promoted Fellow of the Royal College of Physicians of London, and in 1609 he was enrolled as a physician at the St. Bartholomew's Hospital. In 1618, King James I nominated Harvey as his physician. At the Royal College with the Lumleian Lectures, Harvey presented his preliminary ideas on the revolutionary theory of blood circulation that was summarized in the book *Exercitatio anatomica de motu cordis et sanguinis in animalibus* (Frankfurt 1628) dedicated to his patron King Charles I. Harvey, aged 71 years, retired from public life and devoted himself entirely to his studies. In 1651 he published *De generatione animalium* where he advanced the theory of epigenesis. On June 3, 1657, at the age of 79, he died of cerebral apoplexy.

Biography

The natural philosopher William Harvey was a country boy from Kent, the first of nine children, seven males and two females, born in Folkestone on April 1, 1578, to Thomas Harvey, a yeoman wealthy merchant. Smart and curious naturalist, he was admitted to the Grammar King's School in Canterbury in 1588, the year of the Spanish "Invincible Armada," which was attacked and destroyed in the Channel just in front of Folkestone on July 29, 1588. In May 1593 William was matriculated as *pensionarius minor* at the Gonville and Caius College in Cambridge with a 6-year bursary (38 sterling per year), the first scholarship in Medicine in England instituted by the Archbishop of Canterbury Mathew Parker.

John Aubrey described William as small diminutive raven-haired, with brown piercing little eyes, pale, olivaster skin, bright, quickly speaking, and choleric (Aubrey 1898) (Fig. 1).

Oddly enough, William was the first-ever Folkestone Harvey to attend university. The first 3 years in Gonville and Caius College (Fig. 2) were devoted to basic knowledge (Latin, Greek, logic, philosophy, maths, astronomy, music), and the second 3 to medicine. He achieved the title of Bachelor of Arts in 1597, thus becoming a grown man. From 1597 he focused attention on medicine, which in Cambridge was still in infancy, since only two human dissections were carried out annually and no hospital was present at that time. In the summer of 1599, he was sick at home, probably with malaria. He left Cambridge heading toward the continent on October 30, 1599. Caius College statute allowed students of medicine to finish their studies abroad, so he cultivated the idea to move to the University of Padua. The story of his journey is intriguing. When Harvey showed his pass in Dover, he was detained by the governor without a special reason. During the early hours of the next day, a terrible storm ensued and all the passengers of the packet ship drowned, making William Harvey the only survivor of the company of students headed for the continent. This happened thanks to the foresight of the governor, who two nights before had seen in a dream a perfect vision of Doctor Harvey coming to pass for Calais, and notice was given to stop him.

Harvey, William, Fig. 1 William Harvey's portrait, J. Houbraken (1698–1780), London, J. and P. Knapton, 1739. This image is available from the United States Library of Congress's Prints and Photographs division under the digital ID cph.3a09912

Harvey often told this story to his acquaintances, ascribing his good fortune to God's providence (Harvey 1875; Wright 2013).

The choice of Padua was not casual and in keeping with the tradition of illustrious members of the Royal College of Physicians, founded in 1518 by Thomas Linacre (1460–1524, graduated in Padua in 1496) upon a commitment of Henry VIII to fight the charlatans. The lure of Padua was ascribable both to the fame of anatomical studies and well-known professors (Andreas Vesalius, Realduus Columbus, Gabriel Fallopius, Hieronymus Fabricius ab Aquapendente) and to the fact that here the Catholic Church had discontinued the prohibition of the practice of human anatomical dissection of Roman memory. Furthermore, in Padua, it was possible to achieve the graduation by Anglicans, Lutherans, and Jews without the profession of

Harvey, William, Fig. 2 The Gonville and Caius College, Cambridge, by David Loggan, *Cantabrigia illustrata*, Cambridge 1690. Wellcome Collection. Attribution 4.0 International (CC BY 4.0)

the catholic faith, thanks to the freedom and tolerance guaranteed by the Venice Republic and to the imperial authority given to palatine counts to confer the title. For all these reasons, in Padua, there were more students from foreign and remote nations than in any other university of Christendom. William Harvey arrived in the mid of November 1599 and enrolled in medicine. The course lasted 4 years (3 theoretical and 1 practical), but the first 2 years were acknowledged to Harvey thanks to the bachelorship obtained in Cambridge. The faculty consisted of Cesare Cremonini and Giorgio Raguseo, professors of philosophy, Fabricius ab Aquapendente and Giulio Casseri of surgery and anatomy, Giovanni Tommaso Midano of practical medicine, and Galileo Galilei of mathematics. Harvey did not attend the lessons by Galileo, reserved for students of first–second year. The stay in Padua was entirely supported by his father, Thomas

Harvey, since the bursary of the Canterbury archbishop had expired earlier that year (?). Unlike Cambridge, which was a campus with colleges, William found accommodation with a housekeeper, together with an English colleague. Although there are no records of his university enrollment, because all of that year went lost, there are several proofs supporting the presence of Harvey in Padua. He mentioned his stage in Padua several times, and in his book on embryological topic *De generatione animalium* he acknowledged Fabricius as his guide. There are documents dated August 4, 1600, in which he appears as councilor of both *Iuristarum* and *Artistarum* Universities. For this reason, he got two coats of arms, still hanging in the ancient yard of the University of Padua and identified only in 1893. One coat of arms mimics that of Gonville and Caius College, with two snakes coiled around a candle with flame, recalling the Asclepius

Harvey, William, Fig. 3 One of the two coats of arms of William Harvey, Padova, Palazzo Bo, Cortile Antico. Photograph taken by the authors

symbol (Fig. 3) (Ongaro 2006). On March 19, 1602, he appears officially witnessing the graduation in medicine of Thomas Herne, colleague and friend, but his attendance at the University of Padua is especially proven by his graduation diploma, signed by Fabricius, Casseri, Midanoi, and Raguseo on April 25, 1602 (Payne 1908; Marrone 2016) (Figs. 4 and 5). The original diploma was left in Harvey's testament to the King's School of Canterbury, to which he felt quite close for the grammar education and for the scholarship established by Archbishop Mathew Parker to attend superior education in the Gonville and Caius College in Cambridge, a fundamental step in his life and career. On July 1764, the original Harvey diploma was donated by the Reverend Osmund Beauvious, Dean of the King's School, to the Royal College of Physicians in London.

Harvey, William, Fig. 5 Osella with William Harvey coined in occasion of the IV centenary of his graduation in Padua

The history of the diploma bestowal to Harvey in Padua deserves some further information. In 1564, Pope Pius IV, at the end of the Trento Council with the Catholic Counter-Reformation, made mandatory the profession of faith of the university students at the time of graduation in front of the Sacred College, a statement that certainly Lutherans, Anglicans, and Jews could not honor. This obligation was bypassed by introducing in 1597 a practice according to which palatine counts, thanks to a feudal right from the time of the Sacred Roman Emperor Frederick “Barbarossa”, had the power to confer the graduation diploma in place of the catholic bishop. The Harvey final examination and disputation occurred on April 25, 1602, at the home of count Sigismondo Capodilista in the presence of the notary Francesco Refatto. Besides the aforementioned professors, the ceremony was attended, and the diploma signed, by Giuseppe Carrara, the rector of artists, a student from Brescia, and witnessed by several English students like Peter Mansell, Richard Willeby, Samuel Fox, Mathew Lister, Anthony Fortescue, and Robert Durcey. To prevent complications by crossing the border, on the same day April 25, 1602, the notary released a document stating that, before the final examination, William Harvey swore faith to the Roman Catholic Church. This avoided the risk of the Inquisition, which quite recently, in February 1600, had sent Giordano Bruno to the stake.

By serendipity, during those years, Fabricius ab Aquapendente (1533–1619) was carrying out observations on venous valves that resulted in the publication of *De venarum ostioliis* in 1603. He first described these tiny anatomical structures in 1574 in large veins, something that was missed by previous anatomists like Andreas Vesalius and Leonardo da Vinci. However, despite the valves being similar to the sigmoid valves at the root of the great arteries, Fabricius erroneously interpreted them as little doors, slowing blood in its centrifugal flow according to the Galen theory. The venous valves were called *ostioli* (small gates), to slow down the tide of the natural spirit (venous blood) from the liver to the periphery, as to avoid excessive congestion in the limbs and deviate blood laterally to favor tissue perfusion.

Harvey pursued an opposite interpretation, namely a role to hinder the backward blood return during its centripetal direction. Harvey, later in his life, confided to his close friend Robert Boyle that, while investigating the blood movement, he was inspired by the venous valves first observed by Fabricius ab Aquapendente (Boyle 1722, vol. 5, 427). This is clear-cut proof that the idea of blood circulation was conceived when Harvey was a student in Padua. By the way, Harvey will publish in his *De motu cordis* an illustration quite similar to that published by Fabricius in *De venarum ostioliis*.

When back to London, the first step was to accomplish the acknowledgment of his Paduan graduation in Cambridge and get his professional license. With the advent of the Royal College of Physicians in 1518, it was also mandatory to be enrolled as a fellow in order to practice medicine in London and its surroundings. The examination was sustained by Harvey on May 4, 1603, and April 2 and August 7, 1604, with the license pursued on October 5, 1604.

In 1607 Harvey was promoted to Fellow of the Royal College of Physicians and on February 25, 1609, enrolled as an assistant physician to Dr. Wilkinson at the St. Bartholomew’s Hospital for sick poor people (200 beds) and the year after as a physician. Meanwhile, on November 24, 1604, he had married the daughter of Queen Elizabeth Archiater, Elizabeth Brown, who died in 1645 without children. On February 3, 1618, King James I nominated Harvey as his physician.

At the Royal College, Harvey’s credibility and colleagues’ trust increased with time. On August 4, 1615, he was committed *ad vitam* to deliver Lumleian Lectures, six per year. These lectures had been established in 1582 by Lord Lumley, a surgeon with a huge library. The first three lectures were held by Harvey on April 16, 17, and 18, 1616. He presented his preliminary ideas on the theory of blood circulation, skilled with knives as with words. In the lecture of April 17, 1616, he postulated that the blood goes to the lungs and then to the left ventricle and the aorta in a perpetual movement, clearly accepting the existence of pulmonary blood circulation as advanced by the Spanish Miguel Serveto (1511–1553) and

Harvey, William, Fig. 6 Harvey shows a dissected fawn heart to King Charles I and the young prince James. Painting by Robert Hannah, 1848. Royal College of Physicians, London. Photograph taken by the authors

proved through vivisection by Realdus Columbus (1516–1559) in Padua. With the Lumleian Lectures, Harvey anticipated the fundamental concepts which will be at the base of his theory.

Thanks to vivisection in animals (Fig. 6), Harvey established that (1) with cardiac systole and raising the cardiac apex (*mucronis erectio*) the blood goes from the heart to the arteries, (2) arterial pulse is caused by cardiac systole and not by innate pulsative faculty of the arteries, (3) the diastole of the arteries coincides with the cardiac systole, (4) the pulse begins from the auricles and progresses to the tip of the heart, (5) there is a perpetual blood transit from the vena cava to the aorta through the lungs, and (6) there is a blood-stream from arteries to veins, thus circulation is rendered perpetual.

Harvey repeated Fabricius experiment of ligation of the arm. Ligating his servant's arm to swell the veins, he confirmed that blood was indeed

prevented from flowing downward by little gates, no matter was the pushing he extended with his fingers. Harvey deduced that the *ostiola* must function like valves, encouraging the blood flow within the veins in an upward direction from the extremity to the center, namely, to the heart.

The content of Lumleian Lectures was summarized in the book *Exercitatio anatomica de motu cordis et sanguinis in animalibus*, published in 1628 in Frankfurt and dedicated to his patron King Charles I. The book became a cornerstone in the history of science and was several times reprinted in the continent of Europe (Fig. 7). Chapter VIII is very important for the innovative idea of blood circulation. Harvey compares his theory of the blood movement with that of Aristotle of the atmosphere movement: the heart is the origin of the life, the source of the innate heat, and the sun of the microcosm (*cor microcosmi sol*) like the sun is the source of the life and of the

innate heat in the macrocosm (Pagel 1976). These statements recall the words used in the dedicatory letter to Charles I: the heart is the sun of the microcosm as the King is the sun of the kingdom. Since then Charles I was known as “the sun-heart king.” The link with King Charles will become with time tighter and tighter, and they will share a similar fate of decline.

Harvey’s innovative idea was summarized by one of the final statements in Chapter 14: “It is necessary to conclude that there is a circular, perpetual movement of the blood in the animals” (Harvey 1628, 58; Whitteridge 1971; Cunningham 1988; French 1994).

One may wonder why this only 72 pages book written in Latin was published in Frankfurt, already at that time the capital for book printing. Most probably to avoid reactions against his

heretic theory, which could negatively influence his profession. He published in the continent not to draw much attention in England and to avoid endorsement of the Royal College so thoroughly conservative and Galenic. The first English version of *De motu cordis* by an anonymous and not very trustworthy translator was published in 1653 by Richard Lowndes.

Anatomists in favor described Harvey’s theory as “elegant,” “neat,” “simple,” uniform,” “consistent,” “harmonious,” “beautiful,” and “make sense” (Wright 2012, 191). However, overall the impact was negative and compromised his reputation as a physician, since he was considered “cracked mind.” Also, the academy in Europe was very critical, in defense of Galen’s omniscience. Harvey had a dense foreign correspondence, which at that time was the equivalent of letters to the editor, and found a lot of hostility in the medical world (Mitchell 1912; Hamburger 1992).

In 1636 Sir Thomas Howard, Earl of Arundel, organized an official mission in Germany with Harvey. At the University of Altdorf, Harvey performed an autopsy and vivisection in front of the faculty. Professor of Medicine Gaspar Hoffman, a friend and former student with him in Padua, was skeptical of the new theory. The controversy culminated in 1649 when the French physician Jean Riolan (1580–1657), professor of anatomy and dean of the faculty in Paris, who had published in 1648 the book *Encheiridium anatomicum et pathologicum*, rejected the new theory (Riolan 1648). Harvey defended strongly his discovery in a smaller book that was published in Rotterdam in the form of two essays under the title *Exercitationes duae anatomicae de circulatione sanguinis* (Harvey 1649).

Meanwhile, the political situation in England became critical and turbulent and culminated in a civil war, ignited by Oliver Cromwell. The house of Harvey, known as “royalist,” was sacked in Whitehall and his patrimony of books and unpublished notes destroyed, a loss of which Harvey suffered a lot. He lost his position as a physician at the St. Bartholomew’s Hospital and escaped with King Charles I to Oxford, where he

Harvey, William,

 Grammar School in
 Folkestone

was nominated dean of the Merton College. Eventually, on June 1645, Oxford surrendered, and Cromwell took over the rule by establishing a sort of republic. King Charles was placed under arrest and condemned to death by decapitation at Whitehall on January 30, 1649.

Harvey, aged 71 years, retired from public life and devoted himself entirely to his studies (Keynes 1966). He had been for years attracted by embryology, a topic that was of particular interest to his mentor Fabricius, who in 1604 had published the book *De formato foetu*. In 1651, at the age of 73, Harvey published *De generatione animalium* where he advanced the revolutionary theory of epigenesis, namely, the gradual development of the embryo from an undifferentiated egg (*ex ovo omnia*, “everything comes from the egg”), questioning the existing theory of preformed embryo since the beginning (Harvey 1651). By the way he questioned the spontaneous generation. However, the fertilization of the egg by male semen remained still unresolved until the invention and use of the microscope (Pagel 1967).

Eventually, in 1653 he was offered the presidency of the Royal College, which he declined,

giving up also the Lumleian Lectures. He asked to be excused from the offices on the grounds of infirmity and age. On June 3, 1657, at the age of 79, Harvey died of cerebral apoplexy, most probably cerebral embolism by atrial fibrillation. He was buried at Hampstead, Essex, in the family chapel of St. Andrew Church, built by the brother Eliah, curator of his testament. Among the various wills, William left a huge grant to set up a grammar school in Folkestone that was opened in 1674. A grammar school was missing at the time of his childhood, and he was forced to move to Canterbury to attend the King’s School at the tender age of 10, far from his family with inherent emotional implications. Since then the school is named the Harvey Grammar School, and it is still in action (Fig. 8).

Abstract

Bohuslav Hasištejnský of Lobkowitz was a Czech humanist, well-known Latin poet, and philosopher. He spent most of his life in his castle Hasištejn (Hassenstein) in Northern Bohemia where he pursued humanist studies. He wrote several philosophical works, among which *De miseria humana* (Hasištejnský z Lobkovic 1563) is the most significant. Its focus on the immortality of the human soul without reference to resurrection indicates the influence of contemporary Florentine Platonism, specifically Marsilio Ficino's thought. He also assembled a collection of manuscripts and books known as the Bohuslav Hasištejnský of Lobkowitz' Library in his castle. This library was comparable with the best private libraries in Central Europe of that time.

Alternate Names

[Hassensteinius a Lobkowitz](#), [Bohuslaus Baro](#); [Lobkowicz von Hassenstein](#), [Bohuslaus](#)

Biography

A nobleman of the originally Hussite-oriented Lobkowitz family, Bohuslav Hasištejnský studied in Bologna and Ferrara where he became a devout Catholic. In 1482 he became a doctor of Canon Law. Although not a priest, after his return home Bohuslav applied for the position of Bishop of Olomouc and later for the position of auxiliary bishop in Wrocław, although with no determined ambition. He achieved neither position and held no public function until his death, with the exception of his short stay at King Vladislaus's court in Buda. When not traveling (he visited Syria, Palestine, and Egypt), he spent time pursuing humanist studies; his Latin poetry was positively received, even abroad, at that time. He also produced short philosophical tractates dealing mostly with ethical issues. He assembled a collection of manuscripts and books comparable to those held by significant private libraries of his time in Central Europe. Although the castle Hasištejn started turning to ruins quite shortly after Bohuslav's death, his library collection remained preserved. Moreover, it has been recently described and reconstructed by K. Boldan and E. Urbánková so that it now closely corresponds to its original state.

Philosophy

Like many other humanists, Bohuslav Hasištejnský was not specifically concerned with theoretical philosophy. When asked to give his opinion on the philosophical writing *Microcosmos* (now lost), produced by his friend, the Czech nobleman Jan Šlechta ze Všehrd, Bohuslav replied in his letter of 8 May 1501 that theoretical philosophy is a subject inappropriate for a nobleman dealing with state affairs. Bohuslav was partly interested in ethical issues that are included in several of his writings, among which the tractate *De miseria humana* (ed. princeps: Prague, 1563) is the most significant. Here, the author describes the hardships that a man of any status, age, or occupation has to face. Only the eternal life of the immortal soul brings real beatitude, according to the author. From the philosophical perspective, Bohuslav's specific focus on the immortality of

the human soul, as expressed briefly at the end of his *De miseria humana*, seems to indicate the influence of contemporary Florentine Platonism. Several implicit quotations of Marsilio Ficino's Latin translation of Plato's works also indicate Bohuslav's inspiration from this Florentine Platonist (whose writings are, after all, well represented in Bohuslav's library). Similar to Ficino, Bohuslav pays no specific attention to resurrection (without denying it, of course). After its first edition (1563), *De miseria humana* became an esteemed text; nevertheless recognized by Latinists rather than by philosophers or theologians.

Otherwise, *De miseria humana* develops the old theme of human misery popular among numerous Renaissance authors. Bohuslav's influence on later Czech writings dealing with similar themes (N. Vodňanský of Uračov, J. A. Komenský, H. Hirnhaim) is not probable. Vodňanský's work *Theatrum mundi* (Prague, 1605), e.g., relates to Pierre Boaistuau's *Le theatre du monde* (Paris, 1558) rather than to Bohuslav's *De miseria humana*.

Heat in Renaissance Science

Filip A. A. Buyse
St Cross College, University of Oxford,
Oxford, UK

Abstract

The term “heat” originates from the Old English word *hætu*, a word of Germanic origin; related to the Dutch “hitte” and German “Hitze.” Today, we distinguish three different meanings of the word “heat.” First, “heat” is understood in colloquial English as “hotness.” There are, in addition, two scientific meanings for “heat.” “Heat” can have the meaning of the portion of energy that changes with a change

in temperature. And finally, “heat” can have the meaning of the transfer of thermal energy from a hotter to a colder system or body.

By contrast, for the Ancients and Scholastics, “heat” was a manifest, real quality of bodies and there was an ontological distinction between biological or innate heat (which was regarded as an innate principle of life for warm-blooded animals) and the physical manifest heat of external objects, which is potentially harmful. During the late Renaissance period, however, both views changed fundamentally and evolved – via the application of physical and mechanical analogies – into the foundations for today’s unified mechanistic theory of heat.

Heritage and Rupture with Tradition

Heat as a Principle of Nature

In the sixteenth century, several innovators began to criticize the Aristotelian philosophy that had dominated the middle ages. Several *novatores* started to criticize hylomorphism and argued that nature had to be explained by its own principles. Heat was considered to be one of these principles. For instance, Bernardino Telesio (2015) launched an attack on mediaeval Aristotelianism and argued, instead of postulating matter and form, that existence is based on matter and force (Boenke 2013). According to the author of *De rerum natura iuxta propria principia* (1565), this force has two opposing, active principles: heat (which expands) and cold (which contracts). These two processes account for all the diverse forms and types of existence. Other *novatores* such as Giordano Bruno (1548–1600) – who was an admirer of Telesio – also distinguished the two contrary forces: heat and cold. Tomasso Campanella (1591) rejected the fundamental Aristotelian principle of hylomorphism (Ernst 2014) and adopted instead Telesio’s understanding of reality in terms of the principles of matter, heat, and cold, which he combined with Neoplatonic ideas derived from Marsilio Ficino (1433–1499).

Innate Heat of Warm-Blooded Animals

For the early Greek medical and philosophical writers, innate heat became the single most

important power in the animal system (Mendelsohn 1964). It was responsible for all essential functions such as generation and growth. For Aristotle, the source of internal warmth is in the heart (or in a corresponding organ in creatures that do not have a heart) and heat is treated as the source of life and of all its powers: nutrition, sensation, movement, and thought. Moreover, the conservation of innate heat coincided with life, and its destruction with death. Plato, however, restricted the influence that vital heat had on life and death. The author of the *Timaeus* made sure that the sphere of the psyche was not affected by the vital heat or lack of it.

For more than 1500 years Claudius Galenus (AD 131 – c. 201/c. 206) (Galenus 1991) dominated Western medical theory. During the renaissance, Vesalius and others translated many of his Greek texts into Latin. For Hippocrates (c. 460 – c. 370 BC) good health was the result of an equilibrium between four *humores*. Galenus (Galenus 1991) linked these *humores*, however, to four basic qualities: heat, cold, moist, and dry. Galen's conception of innate heat shares a great deal with the formulations in the works of other Greek physicians and philosophers. Heat is considered to be inherent in the body, its origin unclear, but closely tied to life itself. Ibn Sina, better known as Avicenna (2014), was strongly influenced by Galen (Siraisi 2016). The author of the *Canon of Medicine* [*Al-Qanun fi al-Tibb*] identified internal heat with vitality and differentiated it from foreign or external heat which is harmful to bodily heat. Likewise, in the early sixteenth century, Jean Fernel (1548) argued that there is a distinction in nature between the innate heat of living organisms and fire. The sphere of the stars was the source of innate heat. Therefore, innate heat was not derived from fire but from quintessence or aether, thus resembling the heat of the sun. Aristotle (Aristotle 1984) had made a similar point in *De generatione animalium*.

In the first half of the seventeenth century, early scientists such as William Harvey, René Descartes, and Jan Baptist van Helmont started to think about biological heat differently as a result of new discoveries. They became more

and more convinced that biological phenomena such as biological heat could be explained by the same theories that concern processes in the nonliving world. This approach had, in a sense, already been anticipated by Galen (Galenus 1991) who compared the production of heat from foods to the process of combustion as it occurs outside the body. However, this vision only reached its definitive breakthrough during the seventeenth century thanks to the emerging science.

In his masterpiece *De humani corporis fabrica libri septem* (1543), Vesalius (1514–1561) gave a detailed description of the anatomy of a human being. William Harvey (1578–1657) was the first known to describe completely the circulation of blood. During his lifetime, the English physician developed a different vision of the role of heat in living organisms. Harvey no longer considered the heart to be the source of blood's innate heat. Moreover, the author of *On the Motion of the Heart and Blood in Animals* (1628) did not truly seek a real explanation or cause for it. The experimental philosopher linked internal heat closely with blood. Heat had no existence apart from blood just as blood without heat is no longer blood. In other words, heat was reduced to one of blood's important properties.

Descartes (1596–1650) supported Harvey's theory (Harvey 1995) of the circulation of blood but differed fundamentally in his view of the motion of the heart. Descartes developed a theory that posits an intense heat in the heart. According to Descartes, the heart is a kind of container in which the blood is heated. The French philosopher argued that blood entering the ventricles of the heart, drop by drop, was caused “to expand and dilate, as liquids usually do when they are allowed to fall drop by drop into some very hot vessel.” Subsequently, the blood expands and rarefies and is driven through the aorta into the arterial system. Descartes (Descartes 1998, 2017) treated the human body as a machine powered by the intense heat maintained in the heart, which he considered to be the motor or source of that heat. Remarkably, the concept of heat utilized by Descartes is similar to the concept of innate heat proposed by Aristotle.

The iatrochemists of the seventeenth century tried to apply chemical theory to various individual phenomena. Jan Baptist van Helmont (1580–1644) for instance, argued that heat is not an inherent quality of the living organism and that consequently heat cannot not be the cause of vital phenomena. The Flemish chemist stated that heat can generate nothing but heat. In his *Oriatrike or Physick Refined* (1662), he asked how cold-blooded animals could live if food was digested by virtue of the body's internal heat? The Flemish chemist, physiologist, and physician claimed that the heat in the heart is caused by a process of fermentation, similar to processes in the non-organic world, and he suggested that digestion was aided by a chemical reagent, or “ferment,” within the body. Consequently, heat became external to the body and the cause of heat was understood in a similar way to other fermentation processes which occur outside the body.

Innovative and Original Aspects

External Heat of Bodies Versus Heat as an Affection

For Galileo (1960), hotness itself was not an observable, manifest quality. On the contrary, as the author of the *Dialogo* (1632) explains in paragraph 48 of his *Assayer* [*Il Saggiatore*] (1623) what we call hotness is an affection or a sensation of the body that the mind senses. In this polemic work, Galileo introduced his well-known distinction between primary properties and secondary qualities such as heat (Buyse 2015). In this work, Galileo defines a body as a piece of matter and he emphasizes that primary properties are closely linked to that matter, thereby rejecting the peripatetic concept based on matter and form as well as all sorts of occult qualities (which were so important for renaissance philosophers). Secondary qualities, by contrast, are not properties of bodies-in-themselves.

Heat was for Galileo the paradigmatic example of a so-called secondary quality. “Heat” was for Galileo not a “real attribute, property, and quality

that truly inheres in the material by which we feel warmed.” But, what is the nature of heat then and how is it produced in us? According to the author of the *Discorsi* (1638), secondary qualities such as heat which are “considered to be qualities inherent in external objects, do not really have any existence except in us, and that outside of us they are nothing but names. Now I say that I am inclined to believe that heat is of this kind. The materials which produce heat in us and make us feel it, and which we call by the general name fire, are large collections of tiny corpuscles shaped in such and such manner and moving with such and such a speed; when they meet our body, they penetrate it because of their extremely small size. Their contact, which they make as they pass through our bodily substance and which we feel, is the property we call heat. . . .” Obviously, Galileo's view on heat here bears the influence of atomists such as Epicurus and Lucretius whose work *De Rerum Natura* (Lucretius 2014) had been rediscovered in January 1417 and brought to wide public attention by Poggio Bracciolini (Greenblatt 2012) via a medieval copy.

Heat as a Motion of Parts

Francis Bacon (1996) too defined “heat” in terms of motion: “Heat itself, its essence and quiddity is motion and nothing else.” Later, in 1661, Robert Boyle stated in his definition of Mechanical Philosophy (or Corpuscular Philosophy), which he included in the preface of his *Physiological Essays* (1661), that all natural phenomena had to be explained by means of two general principles: motion and matter. Consequently, very basically, there is no heat in nature. There is only matter and motion. Boyle's definition expressed very well how most of his contemporaries thought about qualities such as heat (Boyle 1675). Generally speaking, atomists as well as Cartesians explained “heat” in terms of the motion of tiny corpuscles. Robert Hooke for instance, wrote: “Heat being nothing else but a brisk and vehement agitation of the parts of a body.” We find similar ideas in Descartes, Spinoza, Locke, and other early modern philosophers.

Heat in Renaissance

Science, Fig. 1 The Paduan professor and medicine Santorio Santorio adapted his thermometer – which had a scale and a sensor – to his medical practice and used it for measurement of the body temperature of his patients. This illustration is included on page 307–308 of Santorio’s *Opera* (1660)

Qualitative and Quantitative Measurement of Heat

For the Ancients and Scholastics, heat was considered to be a manifest quality opposed to the contrary quality cold and linked to one of the five elements, namely, fire. For Galileo, by contrast, heat is an affection which entails interaction. However, an affection is subjective. Indeed, person A can experience something as being hot while at the same time person B feels it to be cold. How can this problem of subjectivity be overcome? Galileo addressed this problem. Instead of using the affection of a human body in order to study the presence of heat, the Italian physicist used a gas tube (Mach 2013). By observing the effect that an affecting body had on the volume of air in the tube, he could measure the “hotness” of the body with which it was in contact in a much more objective way. Moreover, he could compare it with the “hotness” of other bodies. Galileo’s air thermoscope was a first attempt at what later would become a thermometer used for measuring the temperature of a physical object (Valleriani 2010).

According to several sources (Middleton 1966), Galileo might have invented the thermoscope while he was a professor at Padua. However, other sources argue that rather the physiologist and physician Santorio Santorio (1561–1636) had developed the first thermoscope [*thermoscopium*], which he used for medical

Heat in Renaissance Science, Fig. 2 Fludd’s figure showing on the left Philo’s thermometer and on the right his own thermometer. This illustration is included on the second page of his *Philosophia moysaica* (1638)

diagnoses. It is probably more correct, though, to argue that the invention of the thermoscope was the result of scientific activities which took place around 1610 in Padua (Fig. 1).

However, it is important to notice that other natural philosophers also developed similar thermoscopes for measuring of heat during the same period. For instance, Giuseppe Biancani

Heat in Renaissance

Science, Fig. 3 Fludd's figure of Philo's thermometer, which he included on page 204 of the second volume of his *Utriusque* (1617–1624)

H

(1566–1624) included an illustration of a thermometer in his *Sphaera mundi* (1620). In 1611, there already existed a thermoscope with a scale or a thermometer, designed by Bartolomeo Telioux, which could be used for quantitative instead of qualitative measurements of heat (Chaldecott 1952). And, also Robert Fludd (1574–1637) claimed to have invented the air thermometer. Furthermore, in the seventeenth century, numerous authors regarded Cornelis Drebbel (1572–1633) as the inventor of the thermometer.

The newly designed gasthermometer designed by Galileo, Santorio, and the other contemporaries that have been mentioned were gasthermometers based on a principle that was known at the time and which goes back to Philo of Byzantium (c.280–220 BC) and Hero of Alexandria (c.10 AD–c.70 AD). Hero's *Pneumatica* (Heron 1971) which was known by Santorio and by Galileo. It had appeared in Latin translation in 1575 and in Italian translation in 1589. Furthermore, it is likely that Fludd had access to twelfth- or thirteenth-century manuscripts of Philo's work (Middleton 1966; Taylor 1942). Obviously, Fludd designed his gasthermometer based on Philo's experiment, as his illustrations make clear (Figs. 2 and 3).

Joseph Solomon Delmedigo (1591–1655), however, in his *Ma'yan Ganim* (1629) compares the gas thermometer, which he learned about as a student at Padua, with another type of thermometer which is closer to the kind thermometer which

we use today: the liquid-in-glass thermometer (Adler 1997). This thermometer was provided with a scale and was designed on the basis of a different principle than Philo's gas thermometer. Interestingly, Galileo's ex-student described this type of thermometer in a text probably written as early as 1621 and published in 1629, even adding an illustration of this type of thermometer. This is more than 30 years before the sealed thermometer designed by Ferdinand II, Grand Duke of Tuscany, who is often credited with the invention of this type of thermometer (Adler 1997).

Hebrew into Latin Translations in Renaissance Italy

Michael Engel
Hamburg, Germany

Abstract

During the fifteenth and sixteenth centuries, a new wave of translations emerged, consisting of Hebrew-into-Latin translations of the Aristotelian commentaries of Averroes. These new translations, produced mostly by Jewish authors who had command of both Hebrew and Latin, were commissioned by renowned Italian patrons. They were bound to improve, replace, or add to the current corpus of Averroes' commentaries available during the Renaissance.

Heritage and Rupture with the Tradition

The commentaries of the twelfth-century Muslim philosopher and religious thinker Averroes (*Ibn Rušd*, 1126–1198) on the works of Aristotle were immensely influential during the Middle Ages in the Latin West. In addition to his original philosophical treatises, Averroes wrote commentaries on almost the entire corpus of Aristotle and on themes ranging from logic to physics, metaphysics, and theology. During the Renaissance, especially in Italy, Averroes' interpretation of Aristotle became the focal point of heated debates among philosophers and theologians, particularly regarding Averroes' interpretation of Aristotle's theory of intellect (Renan 2001; Hasse 2004). In certain academic and intellectual circles of the Italian Renaissance, Averroes became the supreme philosophical authority, second only to Aristotle. For others, however, Averroes and his Latin followers (*averroistas*) became coterminous with heretical views, opposed to the true Catholic faith (2007).

A manifestation of Averroes' centrality during the fifteenth and sixteenth centuries was the publication of Aristotle's works accompanied by

Averroes' commentaries, a printing enterprise which began in Italy in 1472 in Padua and continued throughout the fifteenth and sixteenth centuries (Cranz 1976; Burnett 2013). These editions, which during that period were printed mostly in Venice, contained not only those commentaries of Averroes that were known to the medieval authors but also new translations, commissioned by prominent Renaissance figures such as Pico della Mirandola (1463–1494) and Domenico Grimani (1461–1523). These new translations were made not from the Arabic source, but from Hebrew versions of Averroes' commentaries, available to Jewish translators in Italy during the Renaissance. This phenomenon is commonly referred to as the Averroist translation movement of the Italian Renaissance (Hasse 2016; Wolfson 1963).

The translation movement was motivated by two factors. First, not all the commentaries by Averroes were translated into Latin during the Middle Ages; hence not all were available to the Latin readership. In addition, many of the Averroes' translations that were produced during the Middle Ages did not satisfy the literary tastes of the Renaissance era, in which, under the growing influence of Humanist literary conventions, hostility was manifested toward the Latin-scholastic style and terminology characteristic of the medieval translations (Hasse 2016, 69–70, 342; Di Donati 2013, 28–29; Wolfson 1963, 89–90). The translators who were involved in this movement included Elijah Del Medigo (1460–1493), Paolo Ricci (1480–1541), Jacob Mantino (1490–1549), Calo Calonymos ben David (1480?–1526), Abraham De Balmes (1460–1523), Giovanni Burana (d. before 1523), Vitalis Nisso (d. ?), and an anonymous translator (who translated middle commentary of Averroes' *De anima*) (Di Donati 2013, 31; Engel 2017; Hasse 2016, 343; Licata 2013). In addition to his commentaries, the translations also translated from Hebrew into Latin original compositions by Averroes on philosophy and religion, as well as some of his medical works. At times, the translators also accompanied their translations with explanatory works (Engel 2017; Licata 2013).

Among the works translated were Averroes' commentaries on the *Physics* (De Balmes, Mantino), *Metaphysics* (Del Medigo, Ricci),

Meteorology (Del Medigo), *On the Soul* (De Balmes), *Posterior Analytics* (De Balmes, Mantino, Burana), *Poetics* (De Balmes), *Rhetoric* (De Balmes), and other commentaries on logic and natural philosophy. Among the original compositions by Averroes translated during the Renaissance were the *Incoherence of the Incoherence* (De Blames), the *Decisive Treatise* (Calonymos), and the *Colliget* (Mantino).

The translation movement involved the activity of printers, university professors, humanist scholars, and other cultural agents (Hasse 2016, 71). Jewish scholars in Italy were thus given a pivotal role as purveyors of philosophical knowledge, neutralized of religious affiliation, based on their linguistic skills and familiarity with the philosophical sources, rather than their religious affiliation (Engel 2017, 5–31).

Heliocentrism

Margaret E. Gaida

Division of the Humanities and Social Sciences,
California Institute of Technology, Pasadena,
CA, USA

Abstract

In 1543, Nicolas Copernicus published his *De revolutionibus orbium coelestium*, in which he proposed a radical reordering of the celestial order that put the Sun at the center of planetary motion. The proposal was a profound departure from the prevailing geocentric cosmology in the sixteenth century, which was largely based on Aristotelian physics and Ptolemaic astronomy. While the significance of heliocentrism for the history of science cannot be overstated, astronomy both before and after Copernicus has a long and complex history that provides essential context for understanding the significance of his heliocentric turn.

Heritage and Rupture with the Tradition

For centuries, astronomers had developed and debated different mathematical models that best described the observed motions of the planets, but they had remained firmly committed to the Earth's centrality and immobility. The stationary Earth formed both the literal and metaphorical center of an Aristotelian cosmology. Aristotle's cosmology was based on the four elements: earth, water, air, and fire. These elements were arranged with the heaviest elements placed at the center of the universe and the lighter elements further from the center. The celestial realm was made up of a fifth element, the ether, which was perfect and incorruptible. Motion in the ether by celestial bodies was thus uniform and circular. As a cosmological arrangement, the Earth was at the center of motion and was surrounded by the Sun, then the moon, Mercury, Venus, Mars, Jupiter, and Saturn. Each planet and the two luminaries were embedded in crystalline spheres and moved in perfect circles around the Earth at different speeds from east to west. The sphere of the fixed stars, the outermost sphere, moved from west to east.

In the second century, Claudius Ptolemy developed a series of planetary models that described these motions in great detail. In order to account for these motions, including retrograde motion and variations in speed, Ptolemy introduced a set of mathematical tools. These tools, known as epicycles and eccentrics, were essentially circles dancing around different centers of motion. In his masterwork the *Almagest* and in his *Planetary Hypotheses*, Ptolemy strove to retain Aristotle's central tenet of uniform, perfect circular motion but was not entirely successful. However, the models accounted for planetary motion to a high degree of accuracy and enabled astronomers to construct planetary tables and predict planetary positions.

Ptolemy's models remained intact for centuries, until his Greek texts were translated into Arabic in Baghdad in the eighth and ninth centuries along with several other important

Greek works, including the Aristotelian oeuvre. As Islamic astronomers encountered and reconstructed the great works of Ptolemy and Aristotle, they noticed several incompatibilities of Greek astronomy and cosmology, including many specific problems with Ptolemy's models, and set to work developing new models that sought to reconcile observed planetary motion with a "real," i.e., Aristotelian, description of the physical universe. Islamic astronomers produced several highly sophisticated and novel solutions to the various problems in Ptolemy's models.

One of the main issues Islamic astronomers desired to rectify concerned the notion of uniform, circular motion. Ptolemy had introduced a point, known as the "equant," which served as the center for planetary motion. The equant point was especially problematic because it violated the Aristotelian principle of uniform circular motion. Several Islamic astronomers grappled with this problem and proposed various solutions. These included Nasir al-Din al-Tusi, Ibn al-Shatir, and Ali Qushji. Indeed, the astronomical discipline known as "hay'a," often translated as "configuration," centered on the project of producing a celestial configuration that preserved Aristotelian principles. These Islamic astronomers are important because recent scholarship has acknowledged that it was highly likely that Copernicus had come into contact with their work, either in manuscript form or through oral discussion.

In Europe in the fifteenth century, scholars had also been made aware of the problems with Ptolemy's astronomy and in particular its incompatibility with Aristotle's cosmology. For centuries, European scholars had benefitted from the work of Islamic astronomers translated from Arabic into Latin in the twelfth and thirteenth centuries. By the fifteenth century, European astronomers sought to improve Ptolemy's models but were still very much working within Ptolemy's framework. For example, rather than developing novel models of their own, texts centered on clarifying and resolving Ptolemy's models. Examples include Georg Peurbach's *Theorica novae planetarum* and

Regiomontanus's *Epitome of the Almagest*. In this respect, the Copernican context must acknowledge both the Islamic tradition of *hay'a* and that of European astronomy of the fifteenth century.

Heliocentrism was certainly one of the greatest ruptures in Renaissance thought, but the reasons behind Copernicus's reordering of the planetary order are still debated among scholars. A key element of the fifteenth-century context that very much informed the Copernican context was astrology. Scholars have proposed that Copernicus, while he does not explicitly mention astrological concerns anywhere in his writings, was very much responding to astronomical problems that had been generated by astrological concerns. The need for more accurate astrological predictions and even methods is apparent in the work of Regiomontanus and especially his *Tabulae directionum et projectionum*. The other astrological concern was the question of planetary order, which was of special interest to Copernicus. Whether Copernicus's interest in planetary order was strictly astronomical or had astrological motives is debated, but there is no doubt about his remarkable astronomical innovations.

Innovative and Original Aspects

The humanist reading of classical authors during the Renaissance creates a fine line between heritage and innovation. Certain aspects of "heritage" – such as Ptolemy's models and Aristotle's physics – were called into question, while other aspects of Greek thought were brought to light, especially through an interest in Platonic and Neoplatonic writings. One important example of this phenomenon is the influence of the late Antique author (5th c. CE) Martianus Capella's *De nuptiis philologiae et mercurii* (*On the marriage of Philology and Mercury*) on Copernicus's heliocentrism. Capella presents in his eighth book an astronomical arrangement with the Earth at the center of motion for the moon, Mars, Jupiter, Saturn, and the Sun but has Mercury and Venus orbiting the Sun. Copernicus

cites *De nuptiis* in the Book I of *De revolutionibus* and also hints at several of his other motivations. Scholars agree on many of these, which include divinely inspired harmony and symmetry, humanist principles related to Platonism and Neoplatonism.

Several scholars have also concluded that Copernicus was concerned with the problem of the "equant" and its violation of uniform, circular motion and that heliocentrism was a solution to the "equant" problem. Indeed, several sixteenth-century astronomers acknowledged this achievement. However, Islamic astronomers had been able to develop several mathematical models to solve the problem while retaining a geocentric arrangement. For many modern scholars, eliminating the equant is not a sufficient explanation for such a dramatic cosmological rearrangement.

Copernicus first considered the notion of the Earth's motion around the Sun in a manuscript that circulated among his contemporaries known as the *Commentariolus*, which was written about 1510. From an astronomical perspective, Copernicus was very much concerned with Ptolemy's cosmic arrangement of "nested" spheres, i.e., spheres embedded within each other that left no empty space, and the cosmic distances between planets that this spherical arrangement generated.

The planetary distances posed a distinct challenge. Ancient authors, including Vitruvius and Ptolemy, were aware of a period-distance relationship where the periods of motion of the planets were longer the further the planet's distance was from the center of motion, the Earth. This worked for the outer planets, Mars, Jupiter, and Saturn, but failed for the Sun, Mercury, and Venus, which according to the geocentric system all have the same period. Some scholars have argued that once Copernicus computed the period-distance relationships for Mercury and Venus in a heliocentric system and found that the period for Mercury is less than the period for Venus, he was convinced of the truth. And these assumptions behind the heliocentric turn appear as early as the *Commentariolus*,

even though he is more explicit about them in Book 1, chapter 10 of his *De revolutionibus*.

In his heliocentric arrangement, Copernicus retained the notion of nested spheres but rearranged their order so that the Sun was at the center, followed by the spheres of Mercury and Venus, then the Earth with a sphere that also contained the moon, and then the spheres of Mars, Jupiter, and Saturn. The period-distance relationship was preserved, and this ordering exemplified the divine plan through the harmony and symmetry of planetary motions and the distances between them. Scholars have used Copernicus's discussion of these points in *De revolutionibus* as evidence that Copernicus was convinced of the truth of the heliocentric arrangement.

However, when *De revolutionibus* was published in 1543, it was not clear to early readers whether Copernicus had proposed heliocentrism as merely a mathematical model or whether he was also proposing a novel cosmology. As he died just as the work was published, this question was left unanswered and was hotly debated. To further complicate matters, Andreas Osiander, who brought the *De revolutionibus* to press, included an unsigned preface that asserted the proposition was a "mathematical hypothesis," and not a new cosmology. Several astronomers took up this notion and used Copernicus's models to compute new planetary tables. This was especially true at the University of Wittenberg, where the earliest of these sets of tables was computed by Erasmus Reinhold in 1551. The Prutenic Tables, as they became known, eventually replaced the medieval Alfonsine Tables in popularity.

Copernicus's colleague, Georg Joachim Rheticus, supported the new heliocentric cosmology in his *Narratio prima*, an introduction to the Copernican thesis which he published in 1540, 3 years before *De revolutionibus*. In one case, Tycho Brahe drew on Copernicus's work to present a Renaissance version of the Capellan model. Other readers also adopted the new cosmology and sought to develop it. These included, most notably, Giordano Bruno, Galileo Galilei, and Johannes Kepler.

Impact and Legacy

In the first 50 years following the publication of *De revolutionibus*, there were just a handful of individuals who accepted heliocentrism. Giordano Bruno was famous for being a Copernican who was burned at the stake for his worldviews. However, it was not for his advocacy for heliocentrism that he was tried but rather for his heretical views on the eternity of the world. Thomas Digges, an English astronomer, astrologer, and mathematician, published in 1576 the first exposition of heliocentrism in English as an appendix to an annual almanac. In Germany, Michael Maestlin taught the heliocentric theory to his advanced students, among whom was Johannes Kepler.

In overturning the Aristotelian cosmos, heliocentrism demanded a new physics to explain, among other things, motion both in the heavens and on Earth. According to Aristotle, falling bodies on Earth moved "down" toward their natural place at its center. Planets moved according to a different natural motion, first introduced by the motion of the prime mover, which was uniform and circular. Early in his career, Galileo Galilei recognized the need for a new physics that accommodated the fundamental shift from an Earth-centered to Sun-centered cosmos. He began observing and describing the motion of falling bodies according to mathematical principles rather than Aristotelian precepts.

At the same time, he turned the telescope toward the heavens to observe planetary motion as well. In doing so, he observed the moons of Jupiter and the phases of Venus. In his *Sidereus Nuncius*, or *Starry Messenger*, published in 1610, he recorded the motions of the four moons of Jupiter, which showed that other planets could also be the center of motion for other celestial bodies. This observation very much challenged the idea that the Earth was the center of all motion in the universe. In the *Sidereus Nuncius*, he also provided detailed drawings of the mountains and valleys on the moon, which tested Aristotle's view of celestial bodies as perfect and uncorrupt. Galileo's

telescopic observations of the moon illustrated that celestial bodies could be imperfect.

Over the course of Galileo's life, various religious figures made objections to the heliocentric worldview and held that it was contrary to the faith. Galileo became involved in these disputes through his famous *Letter to the Grand Duchess Christina*. Some scholars have claimed that Galileo transgressed his position by offering theological interpretations of the Bible. These instances led to Galileo receiving a special injunction in 1616 not to "hold, teach, or defend" the Copernican doctrine. However, in 1632, Galileo published his *Discourse Concerning the Two Chief World Systems*, in which he presents the geocentric and heliocentric theories together and concludes that the heliocentric theory is superior. In 1633, Galileo was put on trial and found guilty. He was sentenced to house arrest and died in 1642. Most scholars agree that the general public's understanding of the Galileo affair as a case of "religion versus science" is flawed. The important background of the Counter-Reformation, when the Church was reasserting its authority of Catholic doctrine, is essential. While Pope Urban VIII did in fact condemn Galileo and the official opinion of the Catholic Church was that heliocentrism could only be treated as a mathematical hypothesis, not as a real description of the physical universe, several Catholics were sympathetic to the latter view but were not able to publicly express their views due to the associated risks after the death of Bruno and the trial of Galileo.

Putting the Sun at the center of the universe also caused problems for members of the Reformed church. As a solution, Tycho Brahe developed and advocated for the system first proposed by Martianus Capella in the fifth century. The Earth remained the center of motion for all of the planets except Mercury and Venus, which themselves moved around the Sun. Tycho's system was a viable alternative for those convinced by the astronomical problems that the heliocentric system solved but who considered heliocentrism to be at odds with religious truth.

The Tychonic system also provided a favorable solution for many Jesuit astronomers who were receptive to the mathematical consistencies of the heliocentric model but who were prevented from endorsing it due to their Catholic faith. One Jesuit to adopt this model, Giovanni Battista Riccioli, illustrated its superiority in a famous frontispiece to his 1651 work, the *Almagestum novum*, which depicts the geo-heliocentric system literally outweighing the heliocentric system in a balance. Other Jesuits, such as Christopher Clavius, continued to support the geocentric model but still used the Prutenic Tables and Copernican models to reform the calendar under Pope Gregory XIII.

Tycho also desired to create a new set of astronomical tables that far surpassed the Alfonsine and Prutenic Tables, based on his highly sophisticated observations using state-of-the-art instruments. He passed the task on to Johannes Kepler before his death in 1601, who finally published the Rudolphine Tables in 1627. Kepler, however, rejected the Tychonic system and adopted heliocentrism.

Also inspired by the divine harmony and symmetry in the heliocentric arrangement, Johannes Kepler came to believe that the heliocentric system revealed the divine plan for the sizes and distances of the planets based on the five Platonic solids. This theory, which he published in 1597 in the *Mysterium cosmographicum*, takes a central Sun as the starting point for the proposition that the planetary distances are determined by the shapes and sizes of Platonic solids which enclose each planet's movement about the Sun. Later in his life, the problem of sizes, distances, and the real motion of the planets led Kepler to propose what are now known as elliptical orbits, first for Mars in his *Astronomia nova* and then for all planets in his *Epitome astronomiae copernicanae*.

Copernicus's proposal of heliocentrism may certainly be viewed as a product of Renaissance thought. The notions of divine harmony and symmetry inspired by the humanist rereading of classical authors are highly apparent in Copernicus's own writing. At the same time, the novelty of heliocentrism cannot be overstated. It represents a radical shift away from the ancient and medieval

geocentric cosmology and thus also an entirely new perspective on the place of humans in the universe.

Hermes Trismegistus and Hermetism

Wouter J. Hanegraaff
University of Amsterdam, Amsterdam, The Netherlands

Abstract

The so-called philosophical Hermetica were written down in Egypt in the second to third centuries. They are concerned with philosophical and spiritual teachings about how to find salvation through the attainment of suprarational knowledge (gnosis). Western intellectuals during the Middle Ages had access only to the Latin *Asclepius*, and the core teachings of this tradition were no longer understood. They became available again during the second half of the fifteenth century, when manuscripts of the *Corpus Hermeticum* reached Italy from Byzantium and were translated into Latin by Marsilio Ficino (C.H. I–XIV) and Lodovico Lazzarelli (C.H. XVI–XVIII). According to a highly influential but now discredited narrative created by Frances A. Yates in the 1960s, this led to a “Hermetic tradition” represented by major Renaissance intellectuals such as Ficino, Giovanni Pico della Mirandola, and Giordano Bruno. In fact, none of these thinkers can be properly described as “Hermeticists” or adherents of a “Hermetic philosophy”: most of them are more appropriately labeled “Platonic Orientalists” with a special interest in ancient

Egyptian, Persian, or Hebrew wisdom (attributed, respectively, to Hermes, Zoroaster, or Moses). The true story of Renaissance Hermetism is considerably more modest but fascinating on its own terms. Its central representative was the relatively unknown poet and humanist Lodovico Lazzarelli, whose work became a major influence on Cornelius Agrippa.

Heritage and Rupture with the Tradition

The concept of a “Hermetic tradition” in the Renaissance was placed on the academic agenda by Paul Oskar Kristeller in 1938 and popularized by Frances A. Yates in 1964 (Kristeller 1938; Yates 1964). According to Yates, Marsilio Ficino’s translation of the late Hellenistic *Corpus Hermeticum*, first published in 1471, stood at the origin of a neglected but highly important intellectual tradition that had a great impact on the scientific revolution. Yates’ perspective has remained extremely influential in the academic community and among the wider public and keeps dominating current perceptions of “the Hermetic tradition”; but unfortunately, most of her guiding assumptions have proved to be incorrect. She misidentified important thinkers such as Marsilio Ficino, Giovanni Pico della Mirandola, and Giordano Bruno as “Hermetic philosophers”; she marginalized the actual Hermetic philosophers active in the Renaissance period; and she miscontextualized the *Corpus Hermeticum*, suggesting incorrectly that it was grounded in astral magic and concerned with questions leading up to modern science (Hanegraaff 2015: 180–183). In the wake of Frances Yates’ works, the term “Hermeticism” is still being used as a vaguely defined and highly confusing umbrella term, comprising not only the general belief in an ancient wisdom from the Orient transmitted through the Platonic tradition (Hanegraaff 2012, and see below) but also the general fascination with traditional arts or sciences such as astrology, alchemy, and natural magic.

It is therefore advisable to abandon the popular term “Hermeticism,” as it is burdened with the

Yatesian legacy, and use the alternative “Hermetism” to refer strictly to the religio-philosophical writings attributed to or connected with Hermes Trismegistus (most importantly the *Corpus Hermeticum* and the *Asclepius*) and their commentaries (van den Broek 2005b). As for the much wider domain of traditional arts, theories, and practices concerned with the workings of nature – the so-called occult sciences (see Hanegraaff 2013a) – the fact is that some of the relevant textual materials happened to be attributed to Hermes Trismegistus, while many others were not. This makes it misleading to call such materials “Hermetic” in a general sense. The rest of this entry will therefore focus on the figure of Hermes Trismegistus as an ancient authority in the domains of both spiritual wisdom and the secrets of nature; and, more specifically, on the Renaissance tradition of Hermetism based upon the *Corpus Hermeticum* and the *Asclepius*.

Heritage: Hermetism in Late Antiquity

In the Hellenistic culture of late antiquity, the legendary figure of Hermes Trismegistus (“thrice greatest Hermes”) emerged from a fusion between the Egyptian god Thoth and the Greek Hermes (Fowden 1986). As a semidivine teacher of ancient spiritual wisdom and a supreme authority on the secrets of the universe, his name appears in many textual materials that are either attributed to him directly or were believed to be based upon his knowledge (van den Broek 2005a). In the wake of André-Jean Festugière’s foundational studies of the Hermetic literature of antiquity (Festugière 1950–1954), it has become common practice to distinguish between the “technical Hermetica” (magical, astrological, and alchemical texts that go under the name of Hermes) and the “philosophical Hermetica” (concerned with philosophical and spiritual teachings relevant to the search for a salvational gnosis). During the Middle Ages, a great variety of texts pertaining to the technical Hermetica began to circulate, some in original Latin versions, others in Latin and Arabic translations from Greek originals, and others in Latin translations from the Arabic (Lucentini, Parri & Perrone Compagni 2003). As for the philosophical Hermetica, only the Latin *Asclepius* (based

upon a Greek original of which only a fragment survives) was available to scholars in Western Europe during the Middle Ages.

We do not know how many philosophical Hermetica may once have existed, or in what order they were originally supposed to be read. The collection known today as the *Corpus Hermeticum* was collated in Byzantium during the Middle Ages and seems to have been known in roughly its present form at least since Michael Psellus in the eleventh century. It consists of 17 treatises, numbered rather confusingly as I–XIV and XVI–XVIII since the sixteenth century (the standard numbering derives from the first modern editor of the Greek text, Adrien Turnèbe, who in 1554 included some Hermetic excerpts by Stobaeus as CH XV; later editors retained Turnèbe’s numbering but left out CH XV). It is plausible to assume that the philosophical Hermetica were once part of a spiritual curriculum that began with rational philosophy but should ideally culminate in the attainment of a suprarational gnosis (Fowden 1986; Hanegraaff 2008). The majority of the philosophical Hermetica, including the *Asclepius*, are concerned essentially with standard discussions about the nature of the world, God, and the divine, based upon prevailing Platonic, Aristotelian, and Stoic perspectives. From a philosophical point of view, these texts are interesting but not particularly original or profound. Known as the “general” and “more specific” discourses (*genikoi logoi* and *exodiakoi logoi*; see Hanegraaff 2008: 136), their chief function seems to have consisted in providing a solid intellectual foundation for those who desired to go beyond philosophy to attain ultimate religious salvation through firsthand experience of and unity with the divine.

The first steps toward that goal are described in C.H. I. The anonymous author (conventionally identified as Hermes) relates how one day, after having pondered philosophical problems for a long time, he fell into a trance-like or altered state of consciousness and found himself in the awe-inspiring presence of Poimandres, “mind of sovereignty,” who offered to answer his questions (CH I 1–2). He answers that he wants to understand the nature of “the things that are” and know

God. He immediately receives an answer to both questions, not through verbal instruction but by means of direct vision. First, he sees the world emerging from the encounter between a frightening mass of dark primal substance (*physis*) and a “holy word” (*logos hagios*) that descends on it from the light above. Having watched the conception and birth of the world in this manner, the protagonist is then instructed to “fix his mind on the light . . . and get to know it,” after which Poimandres holds his gaze for a long time. This episode contains the answer to his second question: the divine light that is Poimandres’ spiritual essence turns out to be identical with the visionary’s own spiritual essence. In other words, while looking into Poimandres’ eyes he is looking at himself, and in watching himself he is watching the divine light that is watching him. In this manner, he receives knowledge not only about the nature of the world and the nature of God but about the nature of man as well: knowledge of God means knowledge of one’s self, and the reverse, because in their ultimate essence, they are both the same uncreated light. The rest of C.H. I is devoted to verbal instructions in which Poimandres discusses and extrapolates upon these mystical visions by means of philosophical discourse.

The “Way of Hermes” is continued in C.H. XIII, the most explicitly initiatic treatise of the *Corpus Hermeticum*. Hermes Trismegistus tells his pupil Tat how he has been “born again” into an immortal body that cannot be seen by mortal eyes. His words cause Tat to fall into an ecstatic state of *mania* (divine madness according to Plato, *Phaedrus* 244a–d) that turns out to be the beginning of a similar process of spiritual rebirth. Because Tat’s mode of perception still does not change, Hermes proceeds to invoke 10 “healing powers” of light that expel the 12 irrational “tormentors” of materiality that, as he explains, have been “blocking” Tat’s understanding. These 12 tormentors (personified as demonic entities, linked to the astrological signs, and named “ignorance,” “grief,” “incontinence,” “lust,” “injustice,” “greed,” “deceit,” “envy,” “treachery,” “anger,” “recklessness,” and “malice”) are forced out of Tat’s body and leave “with a flapping of

wings.” As a result of this exorcism, Tat finds that his understanding is indeed unblocked; he now sees external reality not “with the sight of the eyes [but] with the mental energy that comes through the powers” and finds that he is one with the whole of reality: “I am in heaven, in earth, in water, in air; I am in animals and in plants; in the womb, before the womb, after the womb; everywhere” (CH XIII 11). In a parallel passage in CH XI 20, precisely this mode of “cosmic consciousness” is described as what true knowledge of God is all about.

Thus having been “born a god and a child of the One” (CH XIII 14) in a new immortal body, Tat should now be able to rise above the seven planetary spheres of the cosmos and reach the luminous spheres of the eight and the ninth, for “such is the happy end for those who have received gnosis: to become God” (CH I 26). This final ascent is described in a crucial treatise known as “The Ogdoad and the Ennead,” discovered at Nag Hammadi in 1945 and therefore unknown to Renaissance readers. Assisted and guided by Hermes, Tat’s soul travels upward toward the eight and the ninth spheres, where he sees “unspeakable depths,” “the beginning of the Power above all Powers . . . who does not himself have a beginning” (NH VI⁶ 57–58). Most of all, in looking at this ultimate divine reality, he finds that he is looking at himself (*ibid.*, cf. NH VI⁶ 60–61). In other words, the final salvation consists not so much in unification with the divine as in the recognition that he has always been one with it.

Transmission: The Middle Ages

This core message of the philosophical Hermetica got lost during the Middle Ages. Most early Christian authors with an African background (notably Tertullian, Cyprian, Arnobius, Lactantius, and Augustine) were familiar with the Hermetic literature (Mahé 1982, 56–58) and interested in comparing it to the Christian faith. Lactantius saw only a perfect concordance between the teachings of Hermetic and Christian theology, “both as to substance and verbatim” (*Div. Inst.* VI, 25.10); but in a crucial discussion of Platonic thought, Augustine analyzed the passages in *Asclepius* 23–24/37–38 where Hermes praises the Egyptian

practice of animating temple statues, and concluded that Hermes must be condemned as an advocate of idolatry (*De Civ. Dei* VIII, 23–26). The effect of Augustine’s condemnation on medieval discussions was mitigated by a case of mistaken attribution: an anti-Arian tract known as *Adversus quinque Haereses*, attributed to Quodvultdeus since the early twentieth century but previously believed to be by Augustine, contained a positive discussion of Hermes based on Lactantius while making no mention of idolatry. In medieval authors such as Hermann of Carinthia (*De essentiis* 1143), John of Salisbury (*Policraticus* 1159) or Alan of Lille (*Summa quoniam homines* 1.2.31), the positive Lactantian perspective remained dominant; but Augustine’s condemnation made a strong comeback with William of Auvergne (*De legibus* 1228; *De universo*, 1231–6). At this time, Augustine’s perspective was given a new urgency because of its relevance to the potentially idolatrous “science of images,” based upon a range of technical Hermetica concerned with astrology and astral magic that had now become available from Arabic sources (Weill-Parot 2002). Later medieval authorities such as Thomas Aquinas, Thomas Bradwardine, Berthold of Moosburg, and Nicholas of Cusa took different positions between the conflicting Lactantian and Augustinian perspectives (Hanegraaff 2013b; Lucentini et al. 2003), and these intellectual traditions were inherited by the Italian humanists central to the revival of Hermetic literature during the fifteenth century.

Revival: The Platonic-Orientalist Context

The revival of interest in Hermetic literature during the Renaissance should not be seen as an isolated phenomenon. It must be understood within the much broader context of the Platonic revival, based upon some very specific assumptions derived ultimately from Patristic literature, notably Justin Martyr, Clement of Alexandria, Origen, and Eusebius, but also Augustine (Hanegraaff 2012, 17–28). First of all, Plato was not just perceived as a philosopher in the modern sense (that is, as a rational thinker whose conclusions are reached through the discursive technique of Socratic dialogue) but, more broadly, as an

inspired teacher who revealed authoritative religious or spiritual wisdom pertaining to the salvation of the soul. Second, the assumption was that this wisdom had not originated with Plato or Socrates himself but had come from much more ancient Oriental teachers of wisdom. This general perspective on the nature of Platonism may be referred to as “Platonic Orientalism” (Walbridge 2001; Hanegraaff 2012, 12–17). It came in several variants, depending on who was identified as the most ancient teacher of wisdom. Depending on whether the sources of Platonism were assumed to be Persian, Hebrew, or Egyptian, we can distinguish between a “Zoroastrian,” a “Mosaic,” and a “Hermetic” interpretation of Platonic Orientalism.

For religious philosophers during the Renaissance, the Platonic-Orientalist framework implied that Christianity was the inheritor of an extremely ancient tradition of universal wisdom that had reached the Christians through Platonic sources, and Christian doctrine could therefore be harmonized with the most profound teachings of pagan philosophy and religion. According to a first perspective, known as *prisca theologia* and represented notably by Marsilio Ficino, the original purity and perfection of the ancient wisdom had been contaminated and lost through a long process of historical degeneration, and a restoration or revival was therefore needed. An alternative perspective, known as *philosophia perennis* and represented notably by Agostino Steuco, placed the emphasis on continuity rather than decline, arguing that the great tradition of true wisdom had always been kept alive and remained available to anyone who needed it. During the Renaissance, the former perspective carried revolutionary implications of religious reform, as it suggested that the Church had lost its connection with the ancient wisdom and needed to be restored to its original purity. The latter perspective was inherently conservative and could be used to highlight the Church of Rome as the divinely appointed institution charged with preserving the ancient and universal tradition of wisdom.

The revival of Platonic Orientalism during the Italian Renaissance can be traced to the Council of Ferrara and Florence of 1437–1438. On this occasion, the Byzantine philosopher George Gemistos

(c. 1355/60–1452), who called himself Plethon, made personal contact with the circles of Italian humanists in Florence and greatly impressed them with his knowledge of Plato and Aristotle (Hanegraaff 2012, 28–41). He had no interest in Hermes and Egypt, but strongly defended a “Zoroastrian” interpretation of Platonic Orientalism, claiming that the true wisdom had originated with Zoroaster in ancient Persia and had been transmitted to Plato and the Platonic tradition from there. Among those present on whom Plethon’s message made a lasting impression was the young Cosimo de’ Medici, the later ruler of Florence and Maecenas of philosophy and the arts. About two decades after the council, around 1460, Cosimo met the young Marsilio Ficino and recognized a golden opportunity to realize Plethon’s dream of restoring the Platonic philosophy. He put Ficino in charge of translating Plato’s complete dialogues into Latin, thereby creating the foundations for the subsequent Renaissance revival of Platonic philosophy, including the “Hermetic” sources from which it was believed to have sprung.

Marsilio Ficino and Hermetic Philosophy

While Ficino was still in the early stages of his Plato translations, a manuscript from Byzantium arrived in Florence that contained the first 14 treatises of what is known today as the *Corpus Hermeticum*. Cosimo ordered Ficino to interrupt his work on Plato to translate the writings of Hermes first, presumably because he wanted to have a chance to read them before his death. From a Platonic-Orientalist perspective, his motivation is easy to understand: it was believed that Hermes Trismegistus had lived much earlier than Plato, and so his writings might be the ultimate Oriental source from which the Platonic wisdom tradition had emerged. Ficino’s translation was finished in 1464 and survives in many different manuscripts (see Campanelli 2011). However, it was not printed until 8 years later – and even that famous first edition of 1471 (to which we will return) was published without Ficino’s knowledge or authorization, as *Liber de Potestate et Sapientia Dei* or *Pimander*. In fact, it would seem that the *Corpus Hermeticum* had not given Ficino and Cosimo

what they had been hoping for. Plato's dialogues turned out to be far more complex and profound; and in fact, Ficino's translation shows that he did not grasp the core message of the Hermetic literature all that well. We can see this from the rather careless way he handles some of the most crucial Hermetic passages about the attainment of gnosis, and his failure to understand the specificity of this terminology as referring to a salvational "knowledge" unattainable by reason (Hanegraaff 2015).

In the oft-quoted "Argumentum" to the *Pimander*, Ficino provided a famous genealogy of six *prisci theologi*: Mercurius (Hermes) Trismegistus, Orpheus, Aglaophemus, Pythagoras, Philolaus, and Plato. Except for Hermes, this list was taken from Proclus' *Theologia Platonica* 1.5. Ficino quoted Augustine's opinion that Trismegistus had lived several generations after Moses, next to the alternative views of Cicero and Lactantius, who had mentioned no fewer than five "Mercuries," the fifth of whom had been Trismegistus. Otherwise than has often been assumed, Ficino expressed no clear opinion of his own. Regardless of how he may have thought of Hermes' relation to Moses, just one year later he seems to have made up his mind once and for all: from 1464 until the end of his life, he highlighted Zoroaster as the most ancient source of wisdom, prior to both Moses and Hermes. Inspired by both Plethon's work and the biblical story of the *Magi* (interpreted as Zoroastrians), he assumed that far before Moses, Abraham had taken the Chaldaean and Persian wisdom with him when he set out from Ur of the Chaldeans in quest of the promised land (Hanegraaff 2012, 45–46).

Ficino, therefore, did not adhere to the "Hermetic" interpretation of Platonic Orientalism (nor to the "Mosaic" one, as done by his contemporary Giovanni Pico della Mirandola) but to a "Zoroastrian" alternative. The *Corpus Hermeticum* does not seem to have had any deep impact on his thinking: in his later work, notably *De Vita Coelitus Comparanda*, all the attention goes clearly to the notorious "god-making" passages in the *Asclepius* that had been condemned by Augustine and discussed since William of Auvergne (see above). If Ficino paid so much

attention to these passages, this was not because of any deep wish to highlight the wisdom of Hermes but because he needed to counter suspicions that by defending talismanic "images" (with much attention to the medieval *Picatrix*), he might be defending the kind of "Hermetic" idolatry condemned by Augustine.

For these various reasons, it does not make sense to describe Ficino as a "Hermetic philosopher." This interpretation comes from Frances Yates, who consistently overemphasized the god-making passages throughout her famous book of 1964: the *Asclepius* (which, it bears repeating, was nothing new in the fifteenth century) was mentioned at least 80 times, with at least 45 references to *Asclepius* 23–24/37–38, while C.H. I was mentioned about 24 times, and the other treatises were mentioned rarely or not at all (Hanegraaff 2012, 333 n 285).

The Renaissance Transmission of the *Corpus Hermeticum*

Ficino's *Corpus Hermeticum* translation was published almost simultaneously in two different editions: the well-known Treviso edition appeared on 18 December 1471, just 20 days earlier than the largely forgotten Ferrara edition, which came out on the 8th of January 1472. They were based upon two different manuscripts, but although the second edition turns out to be much more reliable, it remained a "stand-alone" version without much further influence. The first edition, on the other hand, became the basis for no less than 9 of the 17 later editions of the C.H. that appeared in the fifteenth and sixteenth centuries (Campanelli 2011; summary overview in Hanegraaff 2015, 183–186, with figure on p. 185). The Treviso edition was published by Geraert van der Leye and Francesco Rolandello, without Ficino's authorization, and turns out to be seriously defective: it has been described as nothing less than "an authentic textual disaster" based upon "scandalous negligence" (Campanelli 2011, cx–cxi). As later editors tried to correct these many errors and omissions without having access to the Greek original or Ficino's manuscripts, the predictable result was an ever-increasing range of variant readings and misunderstandings. An

edition based upon a third manuscript appeared in Florence in 1513 and led to two later editions (Basle 1532, edited by Michael Isengrin, and Cracow 1585, edited by Annibale Rosselli with very lengthy commentaries). Finally – not counting vernacular versions – we have three editions independent of Ficino: the Greek original was published by Adrien Turnèbe (Paris 1554), and new Latin translations by François Foix de Candale and Francesco Patrizi came out in Bordeaux in 1574 and Ferrara in 1591, respectively.

None of these editions succeeded in transmitting the original Hermetic doctrine to Renaissance readers. If Hermes was seen as important, this had much less to do with the intrinsic contents of the writings attributed to him than with his traditional authority as an ancient teacher of divine wisdom, a pagan prophet of Christian doctrine, and an expert in the so-called occult sciences. These elements were all based upon the original Christian and medieval reception of the Hermetic writings and owed little to the new materials now available in the *Corpus Hermeticum*. It is only in the works of a few French authors writing in the mid- and later sixteenth century, Gabriel du Préau and François Foix de Candale, that one begins to see signs of a more adequate understanding of the Hermetic message (Hanegraaff 2015, 199–204).

With her usual flair and sense of drama, Frances Yates claimed that when Isaac Casaubon undermined Hermes' great antiquity by dating the *Corpus Hermeticum* to the second or third century (in his *De Rebus Sacris & Ecclesiasticis* of 1614), he killed the Hermetic tradition “at one blow” (Yates 1964, 398). Referring to Casaubon's heavily annotated edition of Turnèbe's Greek edition, she wrote that “holding this little book in one's hand one realises, with a certain awe, that it represents the death of the Hermes Trismegistus of the Renaissance” (ibid., 401). Today we know that Turnèbe's pupils Gilbert Genebrard (1567), Matthieu Béroalde (1575), and Jean van Gorp (1580) had been criticizing the great antiquity of the *Corpus Hermeticum* since 1567 (Mulsow 2002). During the 1580s, Genebrard's pupil Teodoro Angelucci attacked Francesco Patrizi's ideas about Hermes at great length, leading to vehement discussions with Patrizi and his friends

Francesco Muti and Antonio Persio (ibid.). Casaubon, therefore, seems to have been the closing and culminating protagonist in a debate that had started almost half a century earlier. Moreover, that debate was not yet over. Positive interpretations of the C.H. as well as translations into vernacular languages were published by authors such as Heinrich Noll (1617), Abraham Willemsz van Beyerland (Dutch translations, 1643/1652), and John Everard (English translation, 1650/1657); and in his *True Intellectual System of the Universe* (1678), the Cambridge Platonist Ralph Cudworth argued that Casaubon's arguments were relevant to only some of the Hermetic treatises – the others, including the *Asclepius*, might still be as ancient as had always been claimed. The first German translation of the C.H. by “Aletophilus” appeared in 1706, followed by Dietrich Tiedemann's in 1781 (for the further debate on Hermetism during the Enlightenment and afterward, see Faivre 2005, 539–543).

Lodovico Lazzarelli and Hermetic Gnosis

When Kristeller placed the Hermetic tradition back on the agenda of Renaissance studies, in his seminal article of 1938, he highlighted two central authors: Marsilio Ficino and Lodovico Lazzarelli (1447–1500). A second milestone publication on Renaissance Hermetism (Garin et al. 1955) likewise placed Lazzarelli in the center of the Hermetic revival. However, Frances Yates marginalized him in her famous book on Bruno, dismissing him in a footnote as “a most enthusiastic and exaggerated Hermetist” and directing all further attention to Ficino, Pico, and Bruno. A whole generation of Renaissance scholars followed in her footsteps and forgot about Lazzarelli. This now turns out to have been a dramatic mistake with far-reaching consequences, for whereas Yates' favorites can hardly be referred to as “Hermetists” at all, Lazzarelli is the clearest and most explicit example of a Hermetic philosopher that one will find in the entire Renaissance period. The real “Hermetic tradition” of the Renaissance has relatively little to do with Ficino and even less with Pico and Bruno. Its crucial representatives were Lazzarelli, his “spiritual master” Giovanni da Correggio (ca. 1451?–after

1503; see below), followed by Frances Yates' *bête noire* Cornelius Agrippa.

Lazzarelli was born in San Severino in 1447 and moved to Rome in the first half of the 1470s. He joined the Roman Academy and hoped to achieve fame as a poet until a fateful day in 1481 when he met the strange apocalyptic prophet Giovanni da Correggio. Correggio's sermons made such an impression that Lazzarelli "left the Parnassian hills and everything else, and right away followed him to Mount Zion – the first of his pupils" (Lazzarelli, *Epistola Enoch* 13.1). In other words, he abandoned profane poetry to pursue a spiritual path. One year later, in 1482, Lazzarelli offered his teacher a beautiful manuscript that contained all the philosophical *Hermetica* in Latin, preceded by Prefaces in prose and poetry. Next to the *Asclepius* and Ficino's *Pimander* (C.H. I–XIV), it also contained C.H. XVI–XVIII, translated by Lazzarelli from an independent manuscript of the *Corpus Hermeticum*, more complete than the one that had been used by Ficino. These so-called *Diffinitiones Hermetici* were published after Lazzarelli's death by Symphorien Champier (1507).

Lazzarelli's prefaces to the philosophical *Hermetica* (see Hanegraaff and Bouthoorn 2005, 151–163; Lazzarelli 2009, 81–85) show his deep admiration for the Hermetic wisdom, which he considers to be the key to the true meaning of the Christian message. Most surprisingly, it appears that Lazzarelli identified his teacher Correggio with no one less than Hermes himself: "Father Mercurius, teacher by fatherly love,/Hail to you, who are like a god to me./You have begotten me anew by ethereal seed,/And taught me to be born again without deceit" (ibid., 159). A later manuscript by Lazzarelli, the *Epistola Enoch*, confirms that – no doubt on Lazzarelli's instigation – by 1484, Correggio had come to think of himself as the "Hermetic Christ." On Palm Sunday that year, he made a spectacular appearance in Rome: sitting on a donkey, dressed as Jesus, and wearing a crown of thorns, he entered the city and announced the coming of the end of times. Above his head, he carried a silver-plated disc shaped like the crescent moon, with a text that

identified him as both Pimander and Jesus Christ (ibid., 107–149).

Sometime in the later 1480s, Lazzarelli moved to Naples, where he tried to gain the attention of King Ferdinand of Aragon and Sicily (known as Ferrante). His most important work, a "Dialogue on the Supreme Dignity of Man, entitled the Way of Christ and the Mixing-Bowl of Hermes" (usually referred to as the *Crater Hermetis*), was written here probably between 1492 and 1494. Modeled closely after the Hermetic dialogues, it casts Lazzarelli himself in the role of a teacher of wisdom who initiates two pupils into the Hermetic mysteries. Those pupils are none else than King Ferrante himself and his Secretary of State, the poet and astrologer Giovanni Pontano. Although Lazzarelli succeeded in gaining an audience with the king to present his large poem *Fasti Christiani Religionis*, we have no evidence that Ferrante ever received or read the *Crater Hermetis*. When Charles VIII took possession of Naples on 21 February 1494, a year after Ferrante's death, Lazzarelli made a half-hearted attempt to replace the name "Ferdinandus" with "Caroli," but his new copy dedicated to the French king was never finished.

The *Crater Hermetis* is a unique and powerful text, impressive for its literary qualities no less than for its extremely original interpretation of the Hermetic message. Lazzarelli argues that Poimandres was no one else than the divine Logos himself, the second person of the Trinity, who thus appeared to Hermes prior to his incarnation as Jesus Christ. This same Poimandres/Christ has now taken residence in Lazzarelli and has illumined his mind, so that he is able to instruct his two pupils about the road toward true felicity through attaining self-knowledge or gnosis. Prompted by the questions of his pupils, Lazzarelli embarks on an allegorical exegesis of various biblical passages, explaining such topics as the meaning of the trees in paradise, the women in Proverbs, the Daughters of Men, and the nature of the Fall. These explanations are full of references to the Hermetic writings and cause his pupils to gradually move toward a state of ecstasy that makes them receptive to the true mystery. Remarkably, that mystery appears to be hidden

precisely in the most controversial passages of the Hermetic literature, the “god-making” passages about the animation of statues. Lazzarelli agrees with Augustine that Hermes Trismegistus did indeed lapse into idolatry; but he proceeds to argue that this happened because, as a pagan living before the Incarnation, he was not yet capable of fully understanding the message that Poimandres/Christ was revealing to him. The Egyptians attracted souls into their temple statues because they did not know the secret by which they could create souls themselves. Only the *Christian* Hermetist is able to attain perfect self-knowledge and knowledge of God, and this allows him to unite with God’s innermost being so completely that he even participates in God’s “fertility” – that is to say, his very power of creation. As a result, he can do what only God can do: create souls. In all likelihood, this doctrine of soul creation comes from Eleazar of Worms’ commentary on the *Sepher Yetzirah* and related interpretations in the school of Abraham Abulafia, which Lazzarelli seems to have found in the writings of Pico della Mirandola’s Jewish teacher Yohanan Alemanno. Of course, Lazzarelli’s pupils Ferrante and Pontano express their desire to be initiated into the supreme knowledge that will allow them to create souls; but Lazzarelli postpones his final revelation to a future time.

The Transmission of Lazzarellian Hermetism

One year after Lazzarelli’s death, in 1501, Giovanni da Correggio appeared in Lyons where he managed to gain an audience with King Louis XII. He offered his own *Exhortationes in Barbaros Thurcos Scijthas* to the king, and “a similar work” to the French ambassador, who passed it on to an Italian manuscript hunter, Pietro Aleandro (Hanegraaff 2005, 40–41). In all likelihood, this was Lazzarelli’s deluxe manuscript of Ficino’s *Pimander* (C.H. I–XIV), the *Asclepius*, and the *Diffinitiones Asclepii* (C.H. XVI–XVIII), with Lazzarelli’s introductions. Aleandro took it to Venice and then to Rome, from where Egidio da Viterbo seems to have brought it to Viterbo, where it is still kept today. Aleandro described how Correggio was disputing with two of the king’s physicians, one of whom can be identified as

Symphorien Champier. Champier would seem to have used the occasion to have a copy made of the *Diffinitiones Asclepii*, which he published in 1507, thereby completing Ficino’s translation of the *Corpus Hermeticum* with the final three treatises that were missing from the *Pimander* (Champier 1507).

Correggio’s visit to Lyons thus seems to have been crucial to the subsequent diffusion of the Hermetica from Italy to France and more generally to the French tradition of *prisca theologia* (Walker 1954). Next to Champier’s important publication of 1507, Jacques Lefèvre d’Étaples published Lazzarelli’s *Crater Hermetis* together with the other Hermetica, in an equally crucial edition two years earlier (Lefèvre d’Étaples 1505). However, Lefèvre’s edition was edited to purify it of potentially heretical elements and even deleted all references to Giovanni Pontano: the dialogue now seemed to take place between Lazzarelli and Ferrante alone.

Lefèvre d’Étaples’ edition of Lazzarelli’s *Crater* had a very great impact on Cornelius Agrippa during his “Hermetic” and largely Italian period (1509–1518): as it turns out, he was reading the Hermetica entirely through Lazzarelli’s eyes, and at the core of Agrippa’s religious message, we find Lazzarelli’s innovative doctrine that the man who achieves true knowledge is thereby restored to his pre-lapsarian state and comes to participate in God’s own power of creation. As such, the deified human being can literally “do anything” (Agrippa, *De Occulta Philosophia* 2.50). Agrippa concealed this message behind allusive hints, enigmatic statements, and the evocation of secrets “which should not be publicly discussed” (ibid., 3.36); but if he emphasized the supremacy of Christian “faith” in his later work, what he really meant was Lazzarelli’s doctrine of deification through gnosis (Hanegraaff 2009).

Conclusion

We have seen that current notions of an early modern “Hermetic tradition” are grounded in Frances Yates’ grand narrative and find little support in documented evidence. It is more accurate

to speak of a Hermetic interpretation of Platonic Orientalism, in competition with a Zoroastrian and a Mosaic (Christian kabbalistic) interpretation. Interestingly, while Yates' favorites Marsilio Ficino and Giovanni Pico della Mirandola were explicit and consistent in their adherence to these two latter interpretations, the Hermetic option remained little more than a theoretical possibility. The true founder of Christian Hermetism in the Renaissance period, Lodovico Lazzarelli, showed little interest in Plato or later Platonic authors and focused almost exclusively on Hermes and the Bible (with some additional interest in kabbalah). He understood the Hermetic writings better than any of his contemporaries or early modern successors, but his influence remained limited to Lefèvre's edition and the use that Agrippa made of it. In short, while the dissemination of Hermetic texts during the Renaissance caused a lively *dis-course* about Hermes and the Hermetica, we have almost no evidence for a Hermetic *tradition* (Hanegraaff 2015, 205).

Hermogenes

Born: Tarsus (city in Turkey), late second century
Died: ?, early third century

Véronique Montagne
 CNRS, BCL, UMR 7320, 98 Bd Edouard
 Herriot, Université Nice Sophia Antipolis,
 Nice, France

Abstract

Hermogenes was a Greek rhetorician, whose work was extremely influential from antiquity to the Renaissance.

Alternate Names

[Hermogenes of Tarsus](#)

Biography

According to legend, Hermogenes of Tarsus was sought out early on by Emperor Marcus Antoninus, who wanted to hear his lessons on rhetoric. Hermogenes, therefore, rose to fame at the age of 15, writing his work before the age of 24, at which time he apparently began to lose his mental capacities. Although he was no longer able to improvise, he continued modestly plying his trade into old age as a professor of eloquence (Hermogenes 1997).

Works

The works of Hermogenes of Tarsus were a great success through the end of the Byzantine era. At the time, they were used to teach the basis of technical and practical rhetoric. The Hermogenian corpus consists of *preliminary rhetorical exercises* (*progymnasmata*, usually used to teach the basic forms of declamation) and four treatises: *On Issues* (which lists the types of cases that the speaker may have to plead), *On the Invention of Arguments* (which explains how to expertly compose an impromptu declamation), *On Types of Style* (his most famous work detailing different types of oratory style, including asperity, solemnity, and beauty), and *On the Method of Speaking Effectively* (a short text listing practical rules on repetition, circumlocution, recognized wrongs, etc.). Hermogenes is also the author of two missing treatises, one on the speeches of Demosthenes and the other on characteristics of the *exordium*.

The works of Hermogenes were rediscovered, thanks to Greek immigrants like George of Trebizond (1396–1472), who introduced them to fifteenth-century Europe (George of Trebizond 1538). In a letter dated December 1426 and

entitled *De suavitate dicendi*, Trebizond listed the specific characteristics of taste identified by Hermogenes in *Stylistic Categories* (George of Trebizond 1984). Trebizond's *Rhetoricorum libri V*, published in Venice in 1433–1434, combined Byzantine rhetoric tradition with Latin tradition for the very first time and was the best introduction to Hermogenian thought for almost a century (Monfasani 1976). During the Renaissance, humanist educator Johannes Sturm actively contributed to spreading Hermogenes' ideas – in particular his approach to stylistic categories – by publishing and commenting on his works. For theorists like Sturm, the Hermogenian approach refined the traditional Latin one, which divided styles into three categories (high, medium, and low), and he considered the two to be perfectly complementary (Sturm 1571a, b). Hermogenes' approach became key during the sixteenth and seventeenth centuries in debates on how to define characteristics of poetic genres and certain exercises in prose, such as preaching and controversy.

Hermonymus, Georgios

Born: Mystra c. 1440/50

Died: Paris c. 1508/16

Georgios Steiris

Department of Philosophy, School of Philosophy, National and Kapodistrian University of Athens, University of Athens, Panepistimiopolis, Zografou, Greece

Abstract

Georgios Hermonymos was a Byzantine scribe, translator, and scholar, who worked predominantly as a copyist in Italy, France, and England. Furthermore, he taught ancient Greek to numerous prominent Renaissance scholars, including Erasmus, Budé, Reuchlin, and Jacques Lefèvre d'Étaples. He also engaged in diplomatic activities of the papal Curia during the fifteenth century.

Biography

Georgios Hermonymos was born in Mystra and he was proud of his native land, as he called himself *Spartiates*, although ancient Sparta no longer existed. He was acquainted with the Palaeologus family. In 1473, he lived in Rome

and was Bessarion's protégé. Furthermore, he was appointed by pope Sixtus IV (1414–1484) to negotiate on his behalf. While in Rome, he collaborated with Demetrios Trivolis, Georgios Trivizas, Theodoros Gaza, and Andronikos Kallistos, distinguished members of the Greek scholarly community in Italy. It is probable that he was of the Uniate persuasion. After Bessarion's death (1472), the circle of Greek scholars around him dissolved and most of its members left Rome. The pope entrusted Hermonymos with a diplomatic mission to England in order to contribute to George Neville's, archbishop of York, release from prison. Neville was Bessarion's friend and probably this relation led the pope to choose Hermonymos as his delegate. Against all odds, Hermonymos managed to release Neville. Despite his success, he was accused of espionage and was incarcerated in London for 3 months. Andronikos Kallistos defended him and contributed to his release in 1476. During his stay in England, he taught Greek to prominent members of the English intellectual circles. In 1476 he moved to France, after a short stay in Flanders. He stayed in Paris until his death and became a successful instructor of the Greek language. Some of his students were seminal scholars, as Erasmus, Budé, Reuchlin, David Chambellan of Bourges, and Jacques Lefèvre d'Étaples. Despite the poor comments from some of his students, his work and teaching activity fostered the study of the Greek language in the French capital. He died in Paris, between 1508 and 1516.

Innovative and Original Aspects

Georgios was associated with George of Trebizond, the renowned Renaissance translator and scholar. Georgios admired his work on mathematics and astronomy and contributed to the dissemination of his philosophical ideas in France. He introduced Jacques Lefèvre d'Étaples to Trebizond's texts and the latter used them in his treatises. Georgios' courses focused on humanities and mathematics and built on Pletho's tradition.

Impact and Legacy

Jacques Lefèvre D'Étaples appreciated Hermonymos and introduced him to prominent members of the intellectual circles in fifteenth-century Paris. Furthermore, Reuchlin admired his teaching and corresponded with Hermonymos until the latter's death. In contrast, Erasmus and Budé criticized his knowledge of ancient Greek and his teaching skills. In addition to his acquaintance with Bessarion, Hermonymos enjoyed the support of important figures, including George Neville, archbishop of York, John Shirwood, bishop of Durham, and Charles II de Bourbon, archbishop of Lyon. Moreover, Hermonymos copied over a hundred manuscripts. Besides ancient Greek literature and Christian theology, he also copied a number of Byzantine texts. He also translated ethical, religious, and polemical texts into Latin. In some cases, he commented on the texts he had translated or copied.

Herrera, Hernando Alonso de

Born: around 1460, Talavera de la Reina, Toledo, Spain

Died: around 1527, Salamanca, Spain.

Alejandro Coroleu

Faculty of Arts, Department of Catalan Language, Universitat Autònoma de Barcelona, Barcelona, Bellaterra (Cerdanyola), Spain

ICREA-Universitat Autònoma de Barcelona, Barcelona, Spain

Abstract

A student of Nebrija (whom he described as “nostrae tempestatis doctissimus”), Hernando Alonso de Herrera taught Rhetoric and Grammar at the Universities of Alcalá de Henares (between 1509 and 1512) and Salamanca (after 1513). He was the author of several treatises on grammar, in which he also disputed aspects of Nebrija’s linguistic methodology. Herrera upheld the humanist against the scholastic approach to philosophy.

Biography

Hernando Alonso de Herrera studied in Salamanca under the famous Antonio de Nebrija (1444–1522), whose textbook on Latin grammar, the *Introductiones latinae* (*Introduction to Latin*) of 1481, was designed to replace the medieval manuals employed at the time at the University. After he graduated, Herrera possibly held a teaching position at Salamanca in the latter years of the fifteenth century. His friendship with the Archbishop of Granada Hernando de Talavera led Herrera and his brother Gabriel – best known for his treatise on agriculture – in 1502 to Granada, where he enjoyed the patronage of Íñigo de Mendoza, Count of Tendilla. Around 1508 Herrera was invited by Cardinal Archbishop Francisco Jiménez de Cisneros to join the University of Alcalá, an institution that applied the program of humanism to its curriculum and to the study of Scripture. While at Alcalá, Herrera produced an

annotated Latin translation of George of Trebison’s *Rethoric* (1511). In 1513 Herrera moved to the University of Salamanca, where he replaced Nebrija and remained until the end of his life. As with his teacher Nebrija, Herrera-produced an adaptation of Lorenzo Valla’s *Elegantiae linguae Latinae* entitled *Expositio Laurentii Vallensis de Elegancia Linguae Latinae*. Published in Salamanca around 1515 and reprinted in Alcalá some 12 years later, Herrera’s extract reduced Valla’s text to its most basic and useful form. Herrera’s most important contribution to philosophy is his treatise *Breve Disputa en ocho levadas contra Aristótil y sus secuaces* (*A brief Disputation in eight debates against Aristotle and his followers*), written in Salamanca around 1517, first composed in Latin and subsequently rendered into the vernacular by Herrera himself. Disguised as a discussion of a minor problem of Aristotelian philosophy, Herrera’s work constitutes a strong attack against nominalism and the philosophical and teaching methods employed by the masters of Arts at the University of Paris, particularly the group of Scottish philosophers led by John Mair, who becomes the target of the acerbic criticism of Herrera. In his defense of Renaissance logic, Herrera advocates for rhetorical argumentation over formal syllogistic reasoning.

Abstract

This encyclopedia entry provides information about the life, heritage, and rupture with the tradition, innovative and original aspects, and impact and legacy of Peter Heylyn, a seventeenth-century theological and geographical historian.

Alternate Names

[Heylin, Peter](#)

Biography

Peter Heylyn (also sometimes spelled “Heylin”) was a royalist geographer, theologian, and historian. Heylyn was born in Oxfordshire, attended Magdalen College, and fathered 11 children. Although Heylyn had a strong interest in

geography, he personally traveled very little. Instead, he relied on extant narratives for his information about other countries. Portions of Richard Hakluyt’s *Principal Navigations, Voyages, and Discoveries of the English Nation* (1589) were reused in *Purchas his Pilgrimage* (1613), and Heylyn’s *Microcosmos* (1621) and *Cosmographie* (1652, eight editions before 1700). Arguably his masterpiece, Heylyn’s *Cosmographie* is a collection of voyage narratives from sailors, merchants, and Jesuits that represented at least a century of European perceptions of the rest of the world. As such, it provided valuable information for English-speaking seventeenth-century Europeans about the customs, characteristics, and topographical features of the world around them.

While he wrote this work, the House of Commons tried and executed Charles I, Heylyn’s patron and sovereign, to whom he dedicated *Microcosmus*. For Heylyn, this was yet another tragic incident in a long string of misfortunes. A few years earlier, Heylyn joined Charles at Oxford and acted as his historian of the war, which led to Parliament’s decision to strip Heylyn’s house at Alresford of its contents and plunge him into destitution. Under Cromwell’s rule, Heylyn went into hiding and roamed in England in disguise to avoid detection. There was enough popular interest in Heylyn during and immediately after his lifetime that he was the subject of at least two seventeenth-century biographies, one of which was by his son-in-law John Barnard. Heylyn’s works were bestsellers in his lifetime, and luminaries such as Samuel Pepys and Richard Head read them. In fact, Richard Head copied large sections of Heylyn’s work verbatim in his novel *The English Rogue*.

Heylyn’s decision to expand the scope of *Microcosmus* into a *Cosmographie* and to add a religio-historical “General Introduction” assumes added significance when one views it in light of his personal situation in the middle of the seventeenth century. On the local level in England, Cromwell’s army must have seemed large and powerful, much to the royalist Heylyn’s chagrin. From the more universal perspective that Heylyn adopted, however, the

situation was not nearly so bleak. After all, if South Asian empires with hundreds of thousands of troops and seemingly infinite wealth could be subsumed into a biblical master narrative of determinate growth, then the Cromwellian government's comparatively puny forces and finances, which had not even lasted a decade at that point, appeared far less threatening. From Heylyn's royalist perspective, the cycle of history would eventually restore the Stuarts to their rightful throne.

Though on opposite ends of the political spectrum, Heylyn, like his contemporary John Milton, composed some of his most important works when he was almost completely blind, a testament to his extraordinary memory. Although Heylyn was very widely read in his own time, a few scholars consult his works today. In addition to his association with English royalty, Heylyn was a strong champion of the Archbishop of Canterbury: William Laud. Heylyn is of interest primarily for his insight into the complex range of early modern British perceptions of non-European peoples and religious practices. For instance, Heylyn did not find fault with the Muslim religious practices of the South Asian subcontinent, yet he abhorred the polytheistic Hindu rituals of India such as virginal deflowerings by pagods, *sati*, and self-mutilation. Heylyn died at the age of 62 and is buried in Westminster.

Hilarius of Leitmeritz

Born: ca 1422

Died: 1468

Katerina Solcova¹ and Stanislav Sousedik²

¹Department of Comenius Studies and Early Modern Intellectual History, Institute of Philosophy, Czech Academy of Sciences, Prague, Czech Republic

²Catholic Theological Faculty, Charles University, Prague, Czech Republic

Abstract

Hilarius of Litoměřice was a Czech humanist, philosopher, anti-Hussite theologian, and one of the rare supporters of Lullism at that time in Central Europe. Originally a supporter of Hussitism who spread Franciscus de Mayronis' views presuming that they were close to those of Johann Wycliff's, he was rejected by the ecclesiastical authorities of that time. During his stay in Padua, he acquired several of Raymond Lull's works which he brought to Bohemia. Under the influence of his Padua stay, he became a devout Catholic and accepted the position of administrator of the Prague Archbishopric. Among his writings, the history of the city Plzeň – *Hystoria civitatis Plznensis* – is remarkable.

Alternate Names

[Hilarius of Litoměřice](#)

Biography

As a young man, Hilarius was a supporter of the Hussites. In 1451, he achieved a Master's degree at the University in Prague. In the first half of the 1450s he was sent to study in Padua by Jan Rokycana, the head of Hussite clergy at that time. However, under the Italian influence, Hilarius converted and became a devout Catholic. Since Hilarius had become one of

the leading representatives of the Catholic position, after his return to Prague he could not continue his teaching at the Hussite university. Therefore, in 1461 he began work as the administrator of the Prague Archbishopric which had been vacant for a long period of time, in which position he remained until his death in 1468.

Work

Before his conversion to Catholicism, Hilarius had tried to provide Hussitism with a reliable philosophical grounding at the Prague University. Since Johann Wycliff's teaching, admired by the Hussites, had been rejected by ecclesiastical authorities of that time, Hilarius – together with his colleague Václav of Křižanov – spread the teaching of Parisian doctor Franciscus de Mayronis († ca. 1347), as contained chiefly in Mayronis' tractate *De esse essentiae et existentiae*, presuming that Mayronis' metaphysical views of divine ideas and their relation to divine essence were close to those of Johann Wycliff. In Padua, Hilarius became acquainted with humanist erudition. There, partly through purchasing, partly through making copies, he acquired several of Raymond Lull's works – preserved in Prague to this day (Hejnic, Polívka, p. 38, n. 44) as unique evidence of a very early acceptance of Lullism in the Czech Lands. However, after his return from Italy, Hilarius had no possibility to develop the Lullistic concepts due to his ecclesiastic-political activities. Therefore, the manuscripts brought from Italy remained mostly unnoticed in his time and Lullism only started to spread toward the end of the sixteenth century in the Czech lands. Hilarius was involved in numerous church-political activities, as well as frequent theological controversies with Hussite theologians primarily concerning the topic of the layman's chalice; his main opponent being the head of Hussite party, Jan Rokycana – the archbishop recognized by Hussites, yet never approved by the Roman Curia. Thus far, modern research has paid little attention to the theological content of Hilarius' disputes with Hussites (Urbánek 1921). He also wrote the history of the city of Plzeň (Pilsen) in a humanist manner (*Hystoria civitatis Plznensis*).

Hill, Nicholas

Born: 1570, London

Died: c.1610–1620, Rotterdam

Sandra Plastina

Department of Humanistic Studies, University of Calabria, Arcavacata di Rende-Cosenza, Italy

Abstract

Nicholas Hill was one of the most intriguing and particular personalities of England during

the reign of James I. Details of his life are scarce. He is the author of *Philosophia Epicurea Democritiana Theophrastica proposita simpliciter, non edocta* which was first published in Paris in 1601 and appeared posthumously in a “purged” edition in Geneva in 1619 (Hill 2007).

His work was considered one of the first modern philosophical works containing an open discussion of the theories of Democritus and Epicurus and an affirmation of the heliocentric theory. There is also a significant and direct convergence between Hill and Giordano Bruno regarding the dimensions of the universe formulated in *De immenso*. The topics of the *Philosophia Epicurea* are discussed in 509 sentences or aphorisms – as Hill defines them – in which a number of Greek philosophical terms are disseminated. The work is introduced by a preface dedicated to his son and a series of 15 questions. To a hierarchical and subordinate view of reality, he opposes an alternative image of the world that shows strong traces of the complex model of interpretation of reality developed by Paracelsus.

Biography

Nicholas Hill was born in London and died in Rotterdam c. 1610–1620. He was educated at Merchant Taylor’s School and studied at St John’s College in Oxford. Hill matriculated in 1587, graduated, and was elected fellow in 1590, but within a year he had been deprived. According to some historians, above all John Aubrey, biographer and member of the Royal Society, the philosopher was “an intimate acquaintance” of the mathematician and geographer Robert Hues, a member of the Raleigh-Northumberland circle, which included the mathematicians Thomas Harriot and Walter Warner. According to Hues, Hill was in the retinue of Henry Percy, ninth Earl of Northumberland, patron of science, and natural philosopher, during the 1590s. In 1603 he was involved in an abortive Catholic conspiracy against James I and joined himself with Mr. Basset, who, after Queen Elizabeth’s death,

pretended some right to the crown. After the conspiracy collapsed, the author of the *Philosophia Epicurea* left England and resided in Rotterdam, with his son Laurence. According to an account of Hues, recorded by Obadiah Walker, Master of University College, Oxford, Hill’s son died and he committed suicide. Aubrey reports in his *Brief Lives* that he was not only a natural philosopher and a practitioner of alchemical secrets but also a great Lullianist and a passionate scholar of *ars memoriae*. Ben Jonson refers to the philosopher in one of his epigrams as “an Englishman who maintained Democritus’ opinions,” and, in a quite ironical tone, as the English atomist *par excellence*. In the second section of the second part of the *Anatomy of Melancholy, A Digression of Ayre*, added in 1638, Robert Burton lists the defenders of the earth’s motion, the infinity of space, and the plurality of the worlds: among them there is Hill. In 1622 Tobias Adami in his preface to Tommaso Campanella’s *Apologia pro Galileo* lists the English philosopher among the supporters of the Copernican theory. Following Bruno, Hill maintained the universe is infinite and alive. Space and time are infinite and homogeneous: prime matter is formed of atoms, indivisible, solid particles of various shapes, whose motions and interrelations are governed by a force – vis – which radiates in a manner analogous to light. Atoms in Hill’s scheme are the “end of divine actions in nature” (aph. 116) and the simplest of all truths is: “natura est deus in rebus” or “nature is God in things.” The philosopher is convinced that the infinite creativity of God cannot but express itself in a physical universe that will itself be infinite, since only such a physically infinite and infinitely varied universe suits an infinite creating power. In many passages of the *Philosophia Epicurea*, the judgement pronounced by Hill above all toward Scholastic theology is implacable: it was primarily the conjunction between Aristotelian philosophical theory and the Christian religion that had compromised the understanding not only of the essence of God but also, as a consequence, of the natural world. According to the Paracelsian astronomy, the interior and exterior correspond, and they are considered in the supreme science the expression of the same

substance contained in the unity God-nature. The impressive presence in the *Philosophia Epicurea* of a terminology typical of the original synthesis of Paracelsian medicine, which the Danish Peder Sorensen had already used in *Idea medicinae philosophiae* (1571), indicates a precise choice of field. In his alchemical atomism and in the revival of the great Renaissance philosophical themes by the works of Francesco Patrizi and Giordano Bruno, there is a clue that allows attributing a more precise historical meaning to the philosophical positions expressed in the *Philosophia Epicurea*. According to Trevor-Roper, Hill was probably the author of a second treatise, manuscript, titled *De infinitate et aeternitate mundi*. A part of this manuscript poem in Bodleian library has been published (Plastina and Provvidera 2000) and a new manuscript of 64 pages, in toto, recently found, might be the complete text of Hill's work.

Hippocrates and Hippocratism

Born: ca. 460, Kos [Greece]

Died: between 375 and 351, Larissa [Greece]

Alain Touwaide

Traditions, Washington, DC, USA

The Huntington, San Marino, CA, USA

Abstract

Considered the *father of medicine* according to the historiography of the *Great Figures*, Hippocrates practiced medicine in the Aegean area and in northern Greece during the fifth and early fourth century BC. As the descendent of a family of physicians from the island of Kos, he lived a twofold transformation of medicine and the medical profession, from a hereditary to an open profession and from tradition to observation. Although he did not necessarily write any work (or none of his works has been preserved), he has been credited with the writing of over 60 works of different types on a broad range of medical topics that gradually became what is currently known as the *Hippocratic Corpus* (Jouanna 1999). This collection was transmitted without interruption in Byzantium (though with a differentiated tradition according to the texts), and several treatises were translated into Latin as early as the sixth century AD (Temkin 1932) and into Arabic

mostly during the ninth century. The several Hippocratic works were differently transmitted in the Middle Ages, until they were rediscovered during the Renaissance with several printed editions of Latin translations at the end of the fifteenth century, a complete collection in Latin in 1525 and in Greek in 1526 (Temkin 1979). After it was eclipsed by the *Corpus Galenicum* until the mid-sixteenth century, the *Hippocratic Corpus* became again a major reference among physicians and in medical schools, being commented on by Herman Boerhaave in Leiden in the eighteenth century (Cantor 2002).

Biography

Almost nothing sure is known of Hippocrates' life because of divergences in the biographies that circulated already in antiquity. Born sometime around 460 BC on the Aegean island of Kos to a family of physicians (who identified themselves as Asclepiades, as did all physicians in that time who considered themselves as descendants of the god of medicine Asclepius), Hippocrates learned medicine from his father, got married in the island, and had three children. Hippocrates practiced and taught himself medicine in his native Kos. Soon famous in the Greek world and beyond, as a passage in Plato indicates, he is supposed to have been called to Abdera in northeastern Greece to examine Democritus, accused by his co-citizens to suffer from dementia. Also, he was invited to the court of the Persian king Artaxerxes I (reign 465–424 BC), but he declined. After his parents' death, Hippocrates left Kos for Thessalia, in continental Greece, sometime around 420, possibly to expand his experience by diversifying the areas where he was practicing medicine. From there he seems to have traveled to northern Greece, including the northern Aegean island of Thasos. Whereas the place of Hippocrates' death is known – the city of Larissa in Thessalia – the

date is not and must have been between 375 and 351 BC (Jouanna 1999).

Heritage and Rupture with the Tradition

As the son of a family of physicians claiming to descend from the god of medicine Asclepius, Hippocrates certainly inherited the medical tradition of his time. At the same time, he was living a period of unprecedented scientific developments in the Greek world, which went together with a societal transformation that included a professionalization of intellectual activities. As a consequence, medical education was no longer limited to families of Asclepiades but became open to other members of society through apprenticeship. This transformation is best represented by the *Oath* attributed to Hippocrates, which is in fact a contract between a student and a mentor and does not only define the practice of medicine (for which the *Oath* is most known) but also stipulate the duties of the student to his mentor.

Innovative and Original Aspects

Hippocratic medicine – often defined by opposition to the medicine taught and practiced in the so-called School of Cnidus, supposedly proceeding according to more rigid prescriptions codified in the *Cnidian Sentences* – is characterized by its concept of the body and its method. The human body is considered an assemblage of parts and constituents that interact and are influenced by external factors (including the environment). The body and the bodily processes can be known through observation, correlations between facts (internal and external), and deductions. Health results from the equilibrium of all bodily constituents, whereas disease is provoked by the qualitative or quantitative alteration of any of the bodily elements (including because of environmental imbalances). Hippocratic method is based on the attention to the natural environment of the patients and, as a corollary, the morbidity of

populations (epidemiology); close observation of the signs presented by the patients (clinical analysis) and the comparison of different cases of the same diseases; the notion of the cycle of diseases culminating with the crisis; the identification (diagnosis) and knowledge of diseases (nosology), together with the prevision of their evolution (prognosis); the use of natural resources as therapeutic substances; the attention to nutrition for the maintenance of health and the prevention of diseases; and the use of exercise and physical therapy. Ethics and the regulation of the profession are essential components of Hippocratic medical practice. The whole Hippocratic approach to medicine was best expressed by the *Aphorisms*, each of which crystalizes one component of Hippocratism.

Impact and Legacy

Hippocratic medicine codified in writing the practice of the fifth- and fourth-century health care and provided it with a theoretical corpus in the form of a great variety of treatises that began to be collected as early as the Alexandrine period, while it was still increased with further treatises until the second century AD. The *Hippocratic Collection* was abundantly commented on, and interpreted, by Galen, and these commentaries were studied in Alexandria in late antiquity. A limited number of treatises were translated into Latin, possibly in Ravenna or in North Africa, sometime around the sixth century (Temkin 1932). From Byzantium, where the collection was transmitted in a canonical form and some treatises (e.g., the *Aphorisms*) had wider diffusion, several works were translated into Arabic in the ninth century. In the West, new Latin translations were made from Arabic, focusing on Galen's commentaries. These translations circulated widely and were gradually grouped in a small collection identified as the *Articella*, which was repeatedly printed as early as the late fifteenth century. After new humanistic translations were made on the basis of the Greek text and printed from 1476 on, the

whole collection was printed in Latin in 1525 and for the first time in Greek in 1526, the latter by the Aldine press (Temkin 1979). Hippocratic medicine did not enter university teaching until the mid-sixteenth century. From then on, Hippocratic treatises were commented on in very different ways by numerous physicians who saw Hippocrates as the founder of clinical medicine. This interpretative reappropriation culminated with Hermann Boerhaave (1668–1738) at Leiden, who considered himself the new Hippocrates (Cantor 2002).

Historia Naturalis

Per Landgren
Wolfson College, University of Oxford,
Oxford, UK

Abstract

In early modern academic natural philosophy – *philosophia naturalis* or *physica* – the fundamental body of facts was called *historia*, or sometimes *historiae*, histories. Knowledge of the causes qualified the factual knowledge of a phenomenon to be complete knowledge. Both kinds of knowledge were essential parts of the same discipline. According to this interpretation, which is clearly fleshed out by, e.g., Jacobus Zabarella, natural history was, consequently, no science nor a discipline on its own, but belonged to natural philosophy as long as it delivered factual knowledge from nature and “true” premises to the syllogisms of the science natural philosophy.

Synonyms

Natural History in Renaissance Philosophy

Semantic Change

To understand early modern *historia naturalis* or *physica*, it is crucial to grasp classical Greek and Latin concepts of *historia* and the concept *historia naturalis*. We do not only have to reckon with semantic change since that time, but more specifically, we have to pay attention to shifting meanings and nuances by different classical and early modern authors; not the least in the early modern reception and interpretation of the recurrent renaissance of the logic and natural philosophy of Aristotle.

Etymology

The Greek noun “histor” means originally “the one who knows” (Frisk 1960). This explains the old sense of “witness” and “arbitrator” (Snell 1924) and “to have seen” and, consequently, “to know.” We have this meaning in “polyhistor”; i.e., a person who knows much. When Herodotus uses the ionic variant of the word “historia,” it is often translated as “inquiry” (Schepens 2011). Sometimes, though, it suits the context better to translate it as “the result of inquiry” (How and Wells 1912; Snell 1924; Keuck 1934) or even “schriftliche Darlegung der Nachforschung” (Der Neue Pauly, vol. 5, “Historia”). The last step of this semantic journey implies that “historia” signifies, it is asserted, “systematic observation” and is used for “empirische Wissenschaft” (Snell 1924; Meier 1972, 97). I would like to suggest the more specific meaning “experiential or empirical knowledge.”

The Early Greek Exploratory Tradition

Herodotus, called the “father of history” by Cicero, belonged to a Greek tradition of explorers, who traveled widely and wrote down what they had seen and heard (Jacoby 1956a; von Fritz 1967; Stagl 2002). They aimed to describe experiential facts of, e.g., geography and ethnography out of what they had seen, autopsied, or heard from others, who had seen (Jacoby 1956b; Meister 1990). Jacoby even maintains that Herodotus started as a traveler and geographer, inspired by Hecataeus, later wrote ethnography, and became a historian first in Athens, when he, under the influence of the Periclean democracy, was challenged to write about the Persian wars. In writing about politics and war, chronology became a crucial component in describing and explaining not only “facts” but also causes.

The characteristic trait of an ancient Greek historian was not chronological reports, but factual reports (French 1994). The word that Herodotus regularly used for “narrative,” “narration,” “story,” or “history” is “logos,” not “historia.” The meaning of “historia” as “description,”

“chronological description,” or “chronological narrative” stems from an ionic and late interpretation of “historia,” that is after year the 300 (Menge-Güthling 1910).

Jacoby was fully aware that the ancient Greeks did not have “history” as an independent discipline, corresponding to history in our own time. Instead, Jacoby wrote about the “autoptic character of ionic Ιστοριη” and “the old Ιστοριη-character.”

Aristotle and the Concept of “Historia”

Physics or *philosophia naturalis* was the model discipline of Aristotle. In *Parts of Animals*, book 1, a clear division is made between sensory knowledge of φαίνομενα, and causal knowledge, αιτια, of the same phenomena (Kullmann 1974, 2014). For the Philosopher, the experienced knowledge or factual knowledge was inferior and called *historia*. Knowledge of causes or universals in natural philosophy was certain and therefore superior and called *scientia*. In that regard, the methodology was called “scientific,” since the goal was *scientia*. A researcher collects and classifies experienced or transmitted facts in order to establish universals. Statements of these universal truths are then used as premises in the search for causes and universals. This convincing interpretation of “historia” in the works of Aristotle has been presented and explained in a number of works by Wolfgang Kullmann, and before him, Arno Seifert smoothed the way (Seifert 1976).

Aristotle and Natural History

In the methodology of Aristotle, the researcher had to know “that” (oti), and thereafter “why” (dioti). Firsts facts and particulars and then, causes and universals. Natural history was about facts and facts plus their causes were what natural philosophy was all about. Both facts and causes were important parts in natural philosophy. According to this understanding, natural history was,

consequently, no science nor a discipline on its own, but belonged to natural philosophy, and delivered factual knowledge from nature to the discipline of natural philosophy and “true” premises to the syllogisms of the science. Therefore, Aristotle’s work *Historia animalium* (Περὶ Τὰ Ζῷα ἱστοριῶν, note the plural of “histories”) was, intentionally but not actually, all about presenting empirical results about living beings (Kullmann 2007).

The disciple of Aristotle, Theophrastus (370–287 f. Kr.) confirms this methodology in his *Historia plantarum* (Περὶ φυτῶν ἱστορίας) and his *De causis plantarum* (Περὶ φυτῶν αἰτιῶν). The Roman naturalist Pliny the Elder (23–79 e. Kr.) seems to have written *Naturalis historia* in a similar manner, although only the experiential part. It was about knowledge of particulars, *cognitio particularium*, and the knowledge was the result of inquiries. The histories were not chronological stories but essentially factual knowledge. Chronology had no intrinsic part in “historia.” Historia was a form of knowledge, experiential knowledge.

The Early Modern Aristotelian View of Natural History

Even though there was no single and unified Aristotelianism in the early modern epoch, there was an unbroken continuity of Aristotelian philosophy from the Middle Ages, which developed into an academic hegemony. The predominance was reinforced after the reformation and after a short interval of scattered Ramism (Risse 1964; Seifert 1996; Hammerstein 1996; Petersen 1921; Wundt 1939)

This implies that an Aristotelian theory of knowledge formed the basis of the whole academic enterprise. The most influential early modern interpreter of Aristotelian epistemology was, arguably, the Paduan logician and natural philosopher Jacobus Zabarella (1533–1589). He had a crucial role in reemphasizing the two kinds of knowledge and the Aristotelian concept of *historia* and influential Aristotelian scholars,

such as the reformed logician Bartholomäus Keckermann (1572–1608) was instrumental in disseminating it; in his case throughout the Protestant world at the very beginning of the seventeenth century.

What then did Zabarella say about natural history? In sum, Zabarella was careful in explaining that natural history was the deciding factual basis for natural philosophy, and that all disciplines, except metaphysics, had factual knowledge (*historiae*) at its base as a body of experiential knowledge of the external world, which could be experienced. Causal knowledge of the same phenomena was the epistemological goal of the discipline.

In his *De naturalis scientiae constitutione* (1586), Zabarella answers the question of whether books on *historia* constitute a part of *scientia naturalis*, that is, natural science or physics. His answer is both yes and no. Because, if *libri de historia* – Zabarella implies *historia naturalis* – contribute to the books on *scientia naturalis*, and these books, in their turn, assume an understanding of historical works, they constitute a part of *scientia naturalis*. That motivates also, Zabarella explains, the order of the books *De animalibus*, where the first ones are the books on *historia*. But if we only want to include books that are written demonstratively, then the books on *historia* are no part of *scientia naturalis*. Furthermore, in his *De naturalis philosophiae logicae* (*Opera logica* 1578), Zabarella asks the question of whether there could be an *ars historica*, there he declares that *historia* could be a part of logic, in the same way as the art of rhetoric and the art of poetry are. But he writes, “not just Aristotle, but no one else has, so far, written such an *ars historica* work, and perhaps it is not worth it, because it takes too much time.” In the light of his reception of this Aristotelian concept of *historia*, it is not hard to understand the unwillingness of Zabarella to accept an *ars historica*. As an epistemic category, *historia* is something else than a discipline. *Historia* was a fundamental part of all disciplines except one, but it did not constitute a discipline in itself. In practical philosophy, though, actions and events, *res gestae*, in *historia civilis* or *profana*, almost asked for chronology, and there an art could be possible, according to Zabarella, even

if it is, “perhaps not worth it,” because of its nature of being “a simple and naked narration of events.” In the work *De anima*, he concludes that nothing historical can be said about the soul, because the soul is “insensilis.”

This definition and designation of knowledge about *accidental*ia as *historiae* suggests a quite radical change of the picture in our understanding of the structure of early modern Aristotelian epistemology, since *historia* has commonly been understood as some chronological narrative part. But *historia* is obviously a homonym with at least two wholly different meanings. One chronological and one nonchronological.

This interpretation is also confirmed by a long-range of early modern scholars, who wrote in an Aristotelian manner on natural history within the discipline of natural philosophy and on other factual observations, *historiae*, such as anatomical within medicine and other academic disciplines. Suffice it to mention here the contemporary to Zabarella, the magisterial natural historian Ulisse Aldrovandi (1522–1605). His chair though, which he assumed in 1561 at the university of Bologna, was in natural philosophy (Lines 2001; Fantuzzi 1774) and not in natural history. Zabarella’s explanation of this fits the data. Aldrovandi worked with the fundamental part of natural philosophy, observing, assembling, sorting, and publishing the very building blocks, the particular facts of the disciplines Medicine and Natural philosophy. That would also explain all the different titles as well as the compositions of his works or still unpublished manuscripts, which often include the word *historia* in the singular form, such as *Ornithologiae. Hoc est de avibus historiae* (1599) *Libri XII, Quadrupedum omnium bisulcorum historia* (1621), *Monstrorum historia* (1642), etc. There was even a common disdain, transmitted from Aristotle himself, that the necessary fieldwork collecting raw data was unworthy of a full-fledged scientist, who managed syllogisms and necessary truths. A nice early modern example of this is the famous anatomist Gabriele Falloppia, who had his chair in anatomy and surgery at the University of Padua from 1551 to 1562 (Bellorini 2016). He expressed in a letter (Falloppia 1970) that it was unworthy for a natural philosopher to

work only with natural history, since it only dealt with observation, not philosophical speculation, and with that, Falloppia meant working with syllogisms. Philosophical speculation was not just speculation but to track down the causes of all these *historiae* or factual descriptions.

Modern Research on Early Modern Natural History

Some modern researchers perceive natural history as a kind of initial collection of data before the real experimental and scientific work begins. This is the view of several modern scholars. Willhelm Risse does not write much about natural history at all in his standard work on early modern Logic, since he meant that it had nothing to do with logic. *Historia naturalis* of the Baconian fashion was interpreted as “bloss registrierende Naturbeschreibung” (Risse 1964). Lisa Jardine defines a natural history as “an uncritical record of observations of natural phenomena, which corresponds to the store in the memory of primitive sense-perceptions.” (Jardine 1974). Antonio Pérez-Ramos does not realize the importance of the Baconian project of creating a reliable Natural history and he does not problematize the fact that the restoration of Natural history is described by Bacon and others as the most time-consuming part of and the most important prerequisite for the philosophy of nature and the construction of scientific knowledge. The reason is quite clear, I think. Pérez-Ramos does not include Natural history in Francis Bacon’s idea of natural philosophy at all (Pérez-Ramos 1988). To be sure, other scholars even claim that natural history is a science in its own right, and, as such, comparable with other scientific disciplines and even a progenitor of modern natural science (Ogilvie 2006, 2014). What is more, even “invented as a science in the sixteenth century” (Ogilvie 2006) and “a truly encyclopedic science” (Findlen 2006). Peter Harrison classifies natural history as a historical discipline and in *The Bible, Protestantism, and the rise of natural science* Harrison aims “to explain how the systematic study of nature came to be incorporated into the humanities in the first place,

and to document those events which led to its eventual independence” (Harrison 2011). Dan Garber, on the other hand, says about Bacon that “philosophy is something quite distinct from history” and that Natural history “is linked not with natural philosophy, but with the other kinds of history, civil, ecclesiastical, and literary” (Garber 2010). Graham Rees, highlighted the importance of Natural history. The “establishing of facts was a sine qua non of Bacon’s programme,” wrote Rees in his introduction to *Novum Organum*. “Neglect of this,” Rees continued, “and of his writings on natural history is no help to a proper understanding of his enterprise.” Nevertheless, all the histories of Bacon are and Natural history as such is interpreted by Rees as a “starting point” (Rees 2004). In describing the magnificent plan of Bacon’s Great Instauration, part three on the natural and experimental history, *Phaenomena Universi, sive Historia Naturalis, & Experimentalis ad condendam Philosophiam*, was, according to Rees, “destined for his new functionally defined natural history which was the starting point for this new ‘interpretation of nature’.” The establishment of facts rested, according to Rees, on Natural history. Brian Vickers reminded readers in a footnote that “Bacon uses the term *Historia* in its (now obsolete) synchronic sense as” he quotes *Oxford English Dictionary*, 4, “a systematic account (without reference to time) of a set of natural phenomena. . .[cf. the use of *ιστορία* by Aristotle].” Vickers continues in the note that this “non-diachronic sense has nothing to do with historiography” (Vickers 1992). However, Vickers didn’t say anything further about this “synchronic” or “non-diachronic sense.”

In an article on the scientific methodology of Robert Boyle, the authors focused on the manuscript “Designe about Natural History” and they conceived it to be “enormously important” for the understanding of his “Baconian methodology” (Anstey and Hunter 2008). Earlier research from the 1960s and 1970s stressed the differences between the methodologies of Bacon and Boyle. The present authors, however, maintain that the two prominent figures of experimental philosophy basically were on the same track. They agreed on

how to do natural history. In earlier research, it has been said to be quite an uncomplicated and almost naïve activity. Now it is emphasized as something of utmost importance. Moreover, Anstey and Hunter were surprised that, e.g., Boyle's "Baconianism" has been treated by scholars without any reference to natural history. To their amazement, they pinpointed familiar names like Larry Laudan, Margaret Osler, Steven Shapin, Simon Schaffer, and Antonio Pérez-Ramos. No one since Peter Shaw in 1733 has, according to Anstey and Hunter, "mapped the precise contours of Boyle's Baconianism and in particular his articulation of the relation between natural history and natural philosophy."

In this somewhat bewildering disagreement among modern scholars, it might be helpful to tune in early modern scholars, such as Zabarella and Aldrovandi, to clear our understanding of the Aristotelian concept of "historia" and what early modern Natural history was and still is.

Historiography, Renaissance

Becky Green

Independent Scholar, Eagle, CO, USA

Abstract

As scholars and Humanists in the Renaissance were busy rediscovering Classical texts and deepening their awareness of ancient culture, they were also delving into the emerging nuances of historiography. Not only were intellectuals interested in preserving the events and memories of the past, but they were also interested in *how* this was performed. Ancient scholars, along with writers throughout the Middle Ages, certainly contributed to this discussion by placing a value on eye-witness accounts and facts based on human events (as opposed to mythological events).

The rediscovery of such texts by Renaissance intellectuals allowed this discussion of historical methodology to thrive and develop further. It was these scholars, devoted to rhetoric and its utility in creating didactic texts, who gave historiography a platform during the fifteenth, sixteenth and seventeenth centuries. By definition, Historiography concerns itself with the *study* of history – not simply the works produced by historians, but the methodology of said historians as well. What is considered an acceptable source? What would adequate verification of that source look like? Does one use narrative, poetry, a speech or another form of writing to convey the historical subject matter they have in mind? These questions, among others, were tackled by multiple authors during the Renaissance.

This entry seeks to give the reader a general introduction to historiography, as well as the environment which so greatly fostered its development during the Renaissance.

Heritage and Rupture with Tradition

Historiography plays a very interesting role in the Renaissance and has recently enjoyed a fair amount of attention from scholars. At first glance, it may seem like a small sub-section of other higher-profile topics such as philosophy, literature, and history itself. A closer look, however, will show how it factored into some seminal debates within Renaissance scholarship.

By definition, historiography is the study of history. It examines the products of past scholars who have written about history and have recorded significant events over the years. More importantly, it examines their methodology and practices, their use of sources, and their ideology surrounding the works they produced. How did they define a reliable source of information regarding the past and why? How did they conceptualize past civilizations and how did they interact with the texts and information that came into their possession? What form did they consider optimal for conveying information about the past: narration, genealogies, texts with a universal focus or texts with a specific time period or region in mind? Additionally, what was the *purpose* for writing about history? In recent years, literary theorists and philosophers (as we will see below), have raised skepticisms regarding history as a whole, including epistemological concerns regarding what actually happened in the past versus what the *text* itself purports. Can we really have an accurate idea of what happened in the past and if so, how do we obtain it?

As a discipline, historiography found a congenial environment for growth and development during the Renaissance. The years between 1400 and 1600 were characterized by an obsessive interest in ancient thought, literature, and philosophy since various works from ancient Greece and Rome were rediscovered after years of hiding during the Middle Ages. Given the value Renaissance thinkers placed on the works of Classical scholars, it will be helpful to begin our discussion with an examination of these sources.

While there is a myriad of Classical authors who influenced the Renaissance, we will focus on a handful who specifically shaped the field of history and prompted later Humanist scholars to

expound upon their works. Herodotus (c. 484–425/413 BCE), for example, author of the *Histories*, is known as one of the forerunners of western historical writing, along with Thucydides. Thucydides (c. 460/455–399/398 BCE) wrote the *History of the Peloponnesian War* and was only a few years younger than Herodotus. Jeremy D. Popkin's book provides a solid introduction not only to the field of historiography at large, but also to the ancient authors listed here and their early historical contributions (Popkin 2016). As Popkin highlights in his discussion, although Herodotus and Thucydides were only separated by a short period of time, their historical methodologies were quite different and provided a rich starting point for historiographical discussion. Herodotus, for example, did not hesitate to include stories concerning the deities or mythology in his writings about Greek society. Thucydides, on the other hand, focused on recording only the events of which he could be certain – events purported by eye-witnesses and nothing of mythology (Popkin 2016; see also Lloyd 2012 and Mark 2009 for brief introductions to Thucydides and Herodotus, respectively). Thereafter we have Polybius (c. 200–118 BC), known for his keen observations regarding the evolution of various political systems, and Livy (c. 59 BC – 17 AD) with his history of Rome, *Ab urbe condita*. Both of these intellectuals were extremely formative for numerous Renaissance scholars (especially Leonardo Bruni).

Throughout the middle ages, we see a similar emphasis on eye-witness accounts as a result of the difficulty of relying solely on textual sources. Written sources, after all, were somewhat more scarce in the Middle Ages than they were in the Renaissance (and considerably more scarce than what we are accustomed to after the advent of the printing press and the internet). One interesting example is the *Cronica* of the Anonimo Romano, which includes a first chapter wherein the anonymous author states his reasons and methodologies for writing history, emphasizing that some of the events discussed in the work were witnessed firsthand either by himself or his contemporaries (Anonimo Romano 1981). In addition, chronologies and annual records, often maintained in monasteries, were a common medieval form of writing

history, which historians in the Renaissance consulted later on (Cochrane 1981). Many medieval historians also favored a “universal perspective” when composing their works; in other words, they attempted to create a comprehensive history starting from the Creation and working towards their own current position in time. As we will see, while this trend sometimes continued during the Renaissance, there was also a “municipal” aspect, if you will, during the Renaissance, with some histories focusing more on their city, as opposed to this “universal perspective.”

Building upon the scholarship before them, Renaissance intellectuals continued these historical debates and greatly added to the growth and development of historiography as a whole. And while their practice of history may still seem rudimentary and biased to the twenty-first-century eye, their accomplishments should still be analyzed and appreciated within their Renaissance context, as we will see in the following paragraphs.

While there are numerous Renaissance historians to choose from across continental Europe and Britain, we will start with one in particular given the spatial limitations of the current project, especially since many scholars consider him a forerunner of historiographical methodology during the Renaissance, despite the methodological weaknesses that still remained in his works. Leonardo Bruni (1370–1444) was a statesman and a scholar in Florence just as the Renaissance was coming into full swing. He was heavily influenced by classical authors such as Livy, Polybius, and Thucydides, to name only a few. One of his more prominent works, the *History of the Florentine People*, was imminently well-received in Florence at the time and has provided a springboard for considerable debate regarding Renaissance historiography among modern scholars.

Innovative and Original Aspects

Both Gary Ianziti and Eric Cochrane point out the strengths and weaknesses of Bruni’s tactics. Some of the more important aspects that Bruni contributed to the historiographical considerations of his time were the fact that he preferred to explain consequential events via rationality – not with

the divine or mythological influences of some historians who preceded him, as mentioned above – but in examining the “...intentions, desires, passions, and personal idiosyncrasies of the individual actors...” (Cochrane 1981, 4). Rationality was a foundational characteristic of history for Bruni (Ianziti 2012, 242).

Bruni also demonstrates a heightened conscientiousness in using his sources for his projects. He consulted Florence’s archives in addition to relying on multiple sources as opposed to just one in order to improve accuracy and lessen any one-sidedness (Cochrane 1981, 4–5). Nonetheless, weaknesses, according to modern standards, are still prevalent in his work. Bruni would often reproduce significant sections of sources and classical authors. Ianziti also points out, in conjunction with the works of Anna Maria Cabrini and Riccardo Fubini, that Bruni was not opposed to manipulating his sources “...to suit his pro-Florentine agenda.” (Ianziti 2012 7–9, 229–30; Cabrini 1990; Fubini 2003).

History for Bruni, was also *useful*. It was to be didactic, with utility, not only for policy makers within the Florentine Republic, but for readers in general. While this was not necessarily a new idea (as Cicero was known for proclaiming history as one of life’s “great teachers”) it was unique in the sense that Bruni was offering his historical production within an immediately political context in Florence, something Niccoló Macchiavelli (1469–1527) would share with him a generation later.

It is important to note here, that another popular element of historiography during the Renaissance were speeches – namely speeches given by the main characters within the text of the historical work itself. Many historians during this time considered speeches as a way of adding to the rhetorical element of their work. Not only was it a way to instill the work with pleasing text for the reader, thereby increasing the text’s efficacy with didacticism, but it was also a way to convey the reasons and explanations for which historical figures acted as they did, as Cochrane points out in his discussion on Bruni: “...most of the speeches contain what for Bruni was the most important ingredient of history as a distinct literary genre: the *ratio*, or causes, of the events

recounted. [...] the causes were most appropriately expounded in the very words that were, or that might have been, pronounced by the agent.” (Cochrane 1981, 4).

Interestingly enough, the inclusion of such speeches within historiographical works produced in the Renaissance was subject to much debate among Renaissance scholars themselves. Anthony Grafton provides an interesting discussion of this in his work *What Was History?* (Grafton 2007). In his first chapter, he describes a scholarly rivalry between Jacob Perizonius (1651–1715) and Jean Le-Clerc (1657–1736), where Perizonius heads up the school supporting a rhetorical approach to history, in which speeches were appreciated and respected as an effective tool for the historian. Le-Clerc, on the other hand, championed a more factually-based approach to history, not necessarily a blind-faith reliance on classical authors, but an examination of one’s sources in order to produce an accurate explanation of the events that took place.

It is interesting to note that this discussion of historiographical methodology mirrored a more general discussion that also took place among Renaissance scholars regarding Latin literature, including Latin language itself, and the extent to which it should be mirrored in the original productions of their generations. Some Renaissance scholars argued that fully adopting a classical style with their Latin (more often based on Ciceronian Latin), would be the pinnacle of scholarly achievement, replicating the reason and elegance of the ancient thinkers they so appreciated. Others vouched for a more moderate approach. Others still (as we saw above in Grafton’s discussion of Le-Clerc) advocated a “modern approach” – moving away from imitation and on towards investigation and innovation. Thus, an important aspect to remember about Renaissance historiography is the varied context in which it evolved. On the one hand, there was an almost obsessive reliance and reverence for classical authors; including their writings (if not completely reproducing them) in one’s work was often favored. On the other, there was a growing pull for a more factually-oriented product.

Impact and Legacy

There were, of course, numerous other Renaissance scholars who participated in these discussions: Niccoló Machiavelli (1469–1527), Francesco Guicciardini (1483–1540), and Jean Bodin (1529/30–1596), to name only a few. We focused on Leonardo Bruni here in order to provide a survey of the methodological characteristics present within a renowned Renaissance historian.

It is important to note some of the thought and innovation which has recently occurred in historiographical research, as this will greatly effect anyone embarking on research regarding Renaissance historiography – or historiography of any period, for that matter. Towards the middle of the twentieth century, historiographers such as Hayden White (1928–2018) and Quentin Skinner (b. 1940–) have contributed to what is known as the “Linguistic Turn” – a movement within the discipline of historiography (as well as philosophy, literary theory, etc) where the authority of a historical *text* is no longer taken for granted, but questioned. The Linguistic Turn has its roots in analytic philosophy, specifically in the first half of the twentieth century, when philosophers such as Rudolf Carnap (1891–1970) and Gilbert Ryle (1900–1976) (among others including Wittgenstein [1889–1951] and Russell [1872–1970] before them) noted that the language with which we communicate information is very imperfect and susceptible to many weaknesses (Beaney 2014). In other words, these philosophers were questioning the accuracy, efficacy, and authority of language in communicating concepts. A similar distrust of language and the texts with which concepts were communicated manifested itself in the field of Historiography a few decades later with Hayden White’s work entitled *Metahistory: The Historical Imagination in Nineteenth-Century Europe* (Popkin 2016). Popkin discusses the Linguistic Turn and its influence within the field of Historiography – specifically White’s critique that historical works are more accurately described as narratives – inseparable from the author’s subjective perspective – as opposed to a treatise relying on objective evidence (Popkin 2016). As Popkin mentions, while *Metahistory*

received its fair share of criticism, “White’s emphasis on the literary character of historical narrative and his insistence that historians represent events rather than simply letting the facts speak for themselves has made members of the discipline more self-conscious about how they use language and shape their accounts.” (Popkin 2016, 136).

As Cochrane and Ianziti showed with Leonardo Bruni, works of history, even by the most respected authors in our western tradition, are susceptible to subjective influences. Facts can be distorted; biases can be taken. Similarly, the Linguistic Turn pointed out how much of the evidence and production of historians rely on information communicated via *language* – a medium highly susceptible to the biases and (sub)conscious influences of its authors and the societies in which they live. Peter Burke’s recent article about the influence of Hayden White’s *Metahistory* provides an insightful evaluation of the effect White’s work has had and its recent reception among current scholars (Burke 2013). Gabrielle Spiegel’s work also provides an examination of medieval historiography (particularly that of France) in the light of these advances in historical scholarship since the Linguistic Turn.

In closing, historiography during the Renaissance was the subject of much debate, development, and conscientious improvement, yet simultaneously prone to carrying on certain traditions, which, to the modern eye, should no longer constitute sound, historical methodology. Similarly, the field of history is under more theoretical scrutiny than it has been in the past, putting one of the main vehicles of recording history, the text itself, to a thorough examination. For further readings and information on the Linguistic Turn, please see the following sources: The Institute of Historical Research (2008), Spiegel (1993), Spiegel (1997), White (1973).

Hobbes, Thomas

Born: 5 April 1588, Malmesbury, England

Died: 3 December 1679, Derbyshire, England

Stella Achilleos

Department of English Studies, University of
Cyprus, Nicosia, Cyprus

Abstract

Thomas Hobbes is widely recognized as one of the most important philosophers of all time. He produced work in a variety of fields (including physics and mathematics), but he is best known for his incisive, innovative, and controversial contributions to political philosophy that have had a wide-ranging and lasting impact, especially in the development of contract theory and on theories of sovereignty and the state. Besides his most famous work, *Leviathan*, his major philosophical works include *The Elements of Law*, *De cive*, *De corpore*, and *De homine*.

Biography

Hobbes was born on 5 April 1588 in the parish of Westport, near the town of Malmesbury, in north Wiltshire in England. The period during which he was born was marked by a tumultuous point in the Anglo-Spanish war and just a few months after his birth, in August 1588, the (eventually defeated) Spanish Armada set sail with the purpose of invading England and overthrowing Queen Elizabeth I. Writing about this 84 years later in his verse autobiography, *Vita carmine expressa* (1679), Hobbes remarked that “my mother was filled with such fear that she bore twins, me and together with me fear” (Martinich

1999, 2) – a comment that also points to the central role fear later acquired in Hobbes’s thought and political philosophy. Little else seems to be known about Hobbes’s mother beyond this reference. His father (also called Thomas) was a poorly educated clergyman who served as curate of the nearby parish of Brokenborough. In 1604, he fled from Westport after having been punished with excommunication for exercising verbal and physical violence against the vicar of a neighboring parish, and spent the rest of his life in obscurity.

It is unknown whether Hobbes had the opportunity to see his father again after he fled away and it may perhaps be argued that these events partly sparked the anti-clericalism that became more prominent in his thought later in his life. At any rate, it appears that by the time of his father’s departure from Westport, Hobbes had already been sent to the University of Oxford, possibly with the expectation that as a younger son he would later pursue a career in the church while his elder brother, Edmund, would pursue a career in the cloth-making business. This was a trade practiced with considerable success by various other members of Hobbes’s extended family, including his uncle Francis who supported Hobbes’s education financially and paid for his tuition at Oxford. Besides his uncle Francis, Hobbes was also indebted for his education to Robert Latimer, a young clergyman in Westport who trained Hobbes in his earlier years in Latin and Greek. Latimer, who had studied at Magdalen Hall in Oxford, was an eager classicist. In him, Hobbes found not only an enthusiastic and inspiring teacher but also probably “an intellectual and moral father-figure” (Malcolm 1996, 15–6). Notably, Hobbes too chose to go to Magdalen Hall for his university education at around the age of 14, in 1602 or 1603. Hobbes later expressed criticism for the education he received at Oxford, complaining that the university curriculum was over-dominated by Aristotelian philosophy while excluding other authors and material. Rejecting Oxford’s scholasticism, he also expressed dismay at the fact that he had not been adequately exposed to the sciences, mathematics (especially geometry), but also such fields as astronomy.

Hobbes left Oxford upon completion of his BA, apparently without entertaining any interest in pursuing an ecclesiastical career. Upon the recommendation of the Principal of Magdalen Hall, John Wilkinson, he was immediately hired (probably in early 1608) by William Cavendish (a well-off, influential member of the aristocracy who became the first Earl of Devonshire in 1618) as a tutor to his son (also William). Hobbes, who was just a couple of years older than his pupil, came to serve Cavendish not simply as a tutor but also as a secretary, companion, and friend. Following this point, the Cavendish family provided Hobbes an with important source of patronage that lasted for a great part of his life. His introduction into the family and their connections gave him access to well-stocked libraries (a significant privilege given the high cost of acquiring books), but also numerous opportunities to continue his education, travel, and introduce himself to various formative intellectual circles of the day.

In 1608, Hobbes accompanied Cavendish to Cambridge during his studies at St. John's College and later joined him on a tour of France and Italy – a trip that was once thought to have begun in 1610, though more recent evidence suggests that Hobbes and Cavendish did not embark on this tour before 1614 (Martinich 1999, 29). Even though there is no definitive evidence concerning the date of their departure to the Continent, Hobbes and Cavendish were certainly in Venice in September 1614. While there, both men learned the Italian language; Cavendish exercised his knowledge by undertaking the translation of Francis Bacon's *Essayes* into Italian. On his return to England in 1615, Cavendish – who had previously also published (anonymously) *A Discourse against Flatterie* (1611), a work influenced by Bacon – came into contact with Bacon himself, who had a hand in the revision of his Italian translation of the *Essayes* before it was published in 1618. It was probably during this period, through Cavendish, that Hobbes himself met Bacon, for whom he appears to have done some work as a secretary. Hobbes also helped Bacon with the translation of some of his *Essayes* into Latin. Through Cavendish, who was a member of the Addled Parliament in 1614 and subsequently

of the 1621 parliament, Hobbes was also introduced to various other prominent figures of the day, politicians as well as writers, such as Sir Edwin Sandys and John Selden (with whom Hobbes later developed a friendship). Cavendish became the second Earl of Devonshire after the death of his father in 1626, but his life ended prematurely just 2 years later, in 1628. At about this time, Hobbes was completing his translation of Thucydides' *History of the Peloponnesian War*, an important scholarly achievement that provided the first English translation of Thucydides' text directly from the Greek. Published in 1629 under the title *Eight Bookes of the Peloponnesian Warre*, the translation was dedicated to Cavendish's elder son, the third earl of Devonshire.

Having left the service of the Cavendish family after the death of the second earl, Hobbes found employment in the next 2 years as a tutor to the son of the wealthy landowner Sir Gervase Clifton. During this period he undertook his second tour to the Continent, as in 1629–30 he accompanied his young pupil on a visit to France and Switzerland. Evidence suggests that during this trip Hobbes started reading Euclid's *Elements* and grew passionate about the work's deductive method (Malcolm 1996). Even though this in all likelihood was not his first exposure to geometry, this points to his growing passion for this subject that was to provide his “intellectual paradigm for all true philosophy” and “a standard for any discipline that claimed to be a science” (Rogers 2007, 414). Indeed, as has been argued, the significance of geometry for Hobbes's philosophy cannot be adequately stressed: the analytical method of proof, demonstration, and certainty he found there came to inform all other facets of his philosophy (Martinich 1999, 85).

His preoccupation with mathematics and the sciences more broadly continued after his return to England when he resumed his service to the Cavendishes, having been hired in early 1631 by the second earl of Devonshire's widow as a tutor to her son, the third earl, to whom Hobbes had previously dedicated his translation of Thucydides. His strong interest in the sciences continued well into the 1630s. This decade was particularly important for his intellectual development, as

during these years he also started to give shape to his political philosophy. Studies suggest that during this decade he came into contact with a number of prominent figures in England, having developed connections with various members of two important intellectual groups in the country, the so-called Great Tew circle that gathered around Lucius Cary, Viscount Falkland (and included such figures as Lord Falkland, Sydney Godolphin, William Chillingworth, and Edward Hyde, first earl of Clarendon), and the so-called Welbeck academy (a group of thinkers with a particular interest in science who gathered around the earl of Newcastle). The latter included such figures as Newcastle's brother, Sir Charles Cavendish, whose interest in mathematics served to stimulate Hobbes's own interest in areas such as geometry, optics, and physics even further.

During this period, Hobbes also came into contact with a number of leading intellectuals on the Continent. This happened during his third tour to the Continent, undertaken with his pupil, the third earl of Devonshire, from 1634 to 1636. Besides sojourns in Rome, Florence, Venice, and Lyon, this tour also included two prolonged stays in Paris, which placed him in the company of such important figures as Marin Mersenne, who had a central position in an extended network of leading intellectuals including René Descartes and Pierre Gassendi. During this tour, he is also believed to have met Galileo in Florence. As has been argued, "Hobbes's speculations about the physical universe took wing during this visit to Europe" (Martinich 1999, 91). Indeed, it is probably during this period that he came to adhere more firmly to some of the most important premises in his philosophy – more specifically, his materialist notion of the universe and the idea that "all that exists, including all human cognitive processes and actions, was nothing but motion" (Martinich 1999, 90).

Hobbes eagerly continued his scientific and philosophical work after his return to England in October 1636. During this period, he began to analyze his materialist notion of the universe in greater depth, developing his ideas around three types of bodies; the three main parts, as he later

argued in his verse autobiography, of "The whole *genus* of philosophy . . . *Corpus, Homo, Civis*, body, man and citizen" (transl. by Skinner, in Skinner 2002, 7). Framed with this notion, he then decided "to write three books on these issues, and started to collect [his] materials every day" (transl. by Skinner, in Skinner 2002, 8). Thus, a great part of his intellectual efforts after his return to England in 1636 concentrated on this tripartite project.

By the end of the 1630s, he produced his earliest surviving scientific treatise, a manuscript called the "Latin Optical MS." Concentrating on optics (which would later be the subject of the first half of Hobbes's book *De homine*, published in 1658), this treatise launched a critique of Descartes's mechanistic physics in the "Dioptrique," the basic premises of which (as, for example, the idea that perception is the product of physical motion) closely resembled Hobbes's own theories. This was followed by an exchange of letters between the two philosophers that soon developed into a cantankerous argument that continued for a great part of their lives over who had advanced these ideas first, with each side even accusing the other of plagiarism.

By May 1640, Hobbes also completed his first major philosophical work, *The Elements of Law, Natural and Politic*. This work, which tackled the third part of Hobbes's tripartite project, was dedicated to his patron, the Earl of Newcastle. The dedicatory epistle was signed shortly after the abrupt dissolution of the Short Parliament of April 1640 which gave voice to many concerns regarding various issues that marked King Charles I's so-called personal rule in the 1630s. This included King Charles's attempts to levy ship-money without parliamentary approval, an issue that raised various questions concerning the limits of sovereign power and the extent to which the power of the king was absolute. Members of the Short Parliament expressed fierce opposition to this notion and by extension to the idea that the king had the right to impose taxes and confiscate his subjects' property without parliamentary approval, or be the judge of what circumstances were exceptional. In *The Elements of Law*, Hobbes developed the reasons why he thought

sovereignty was necessary but also argued that those exact reasons made it necessary for sovereignty to be absolute. Therefore, he held that it was also necessary for all the rights of the subjects, including their rights to private property, to be ceded to the sovereign. While some of the ideas found here would be developed in closer detail in his two later publications, *De cive* and *Leviathan*, *The Elements of Law* contains many of the basic premises of Hobbes's political philosophy.

Even though Hobbes's notion of sovereignty as would later be remodeled in *Leviathan* is not necessarily tied with monarchy, *The Elements of Law* (numerous copies of which circulated in manuscript) was read as a clearly pro-royalist text that advocated the absoluteness of the king's power. Within the tumultuous political context of the period, the reception of his book gave Hobbes good cause to fear for his safety. As he later remarked, *The Elements of Law* "occasioned much talk of the Author; and had not His Majesty dissolved the Parliament, it had brought him into danger of his life" (quoted in Malcolm 1996, 28). The growing intolerance toward pro-royalist polemic in the newly-convened Long Parliament in late 1640 gave him grounds to think that he might be brought to account for his book, so by the end of the year, he fled the country and found refuge in Paris. By this time, he was financially secure enough to venture a long sojourn abroad.

During his self-exile in Paris in the 1640s, Hobbes found himself in an intellectually stimulating community within which he further developed his intellectual pursuits, especially in physics, metaphysics, and theology. Coming back into the company of his old acquaintance Marin Mersenne, he was introduced to a number of leading French philosophers and scientists, including such figures as Pierre Gassendi (with whom he developed a close friendship), Gilles Personne de Roberval, and Abraham du Prat. It was Mersenne who also made the arrangements for the publication in 1642 of Hobbes's *De cive*, a book that developed many of the ideas found in *The Elements of Law*. Subsequently re-issued twice in 1647, *De cive* is the work that served to firmly establish Hobbes's reputation as a political

philosopher in Europe. Following the first publication of the book in 1642, Hobbes turned his attention to the natural sciences and wrote a massive critical response to *De mundo*, a treatise by Thomas White (an English Catholic priest who was also in exile in Paris) that had been published in September 1642. During the 1640s, Hobbes also worked on various drafts of *De corpore*, his major attempt in the fields of logic, metaphysics, and physics. His work on this book (eventually published in 1655) faced various obstacles and interruptions, especially after the arrival in Paris in 1645 of the two brothers, also royalist exiles, Sir Charles Cavendish and the marquis (formerly earl) of Newcastle. It was at the latter's instigation that Hobbes engaged in a debate with the Anglican cleric John Bramhall (who was also exiled in France) over the nature of free will. As part of this disputation, Hobbes wrote a short treatise titled *Of Libertie and Necessitie* (which was published without his permission by John Davies in 1654). Also, in the summer of 1646, Hobbes assumed duties as the mathematical tutor of the young Prince Charles, newly arrived in Paris. While his assumption of this position probably interrupted his work on *De corpore*, it brought him into contact with an even greater circle of royalist exiles (including such figures as Edward Hyde and the poet Sir William Davenant). His old friend, the poet Edmund Waller, also found himself exiled in France after 1644.

It was later in the 1640s that Hobbes's thoughts probably turned more insistently back to England and he started contemplating his return. This was perhaps prompted by the fact that in 1648 he lost the company of two of his closest friends in Paris: Mersenne who died in September of that year, and Gassendi who subsequently left the French metropolis. Hobbes's homeward mood near the end of the 1640s may also be suggested by the fact that he took the trouble to have *Leviathan* (the work he would later become most famous for) printed in London. He probably did not start writing *Leviathan* until later in 1649, but his work progressed rapidly so the book was published in 1651. By that time, the political situation in England had changed drastically since Hobbes's departure. Following the defeat of royalist forces

in the civil wars that started in 1642, the country saw the execution of King Charles I in January 1649 and thereupon the establishment of a republic. Hobbes's powerful analysis of sovereignty in *Leviathan* gains special currency within this historical context. On the basis of his discussion, sovereign power can only be properly sovereign if it remains absolute and undivided. In a poignant comment on the situation in his country, he suggests that the ravages of the civil war – a situation that for Hobbes is akin to the condition he describes as the “state of nature” (a horrifying condition of perpetual war of all against all) might have been avoided in England if people had understood the significance of the indivisibility of sovereign power: “if there had not first been an opinion received of the greatest part of England, that these Powers were divided between the King, and the Lords, and the House of Commons, the people had never been divided, and fallen into this Civill Warre” (Hobbes 1996, 127). As he further notes in the same passage, “a Kingdome divided in it selfe cannot stand” (Hobbes 1996, 127).

Yet, Hobbes's endorsement of absolute sovereignty and his expression of dismay for the fact that England was thrown into the devastating experience of civil war should not be seen as an unequivocal demonstration of support for Stuart monarchy or, more generally, for monarchy as a constitutional form. Ironically, while providing an unmistakable championing of absolute sovereignty, the argument in *Leviathan* was found to be at least distasteful by the royalist camp – especially due to how Hobbes responded to the ideological controversy caused by the so-called Engagement, the oath citizens were required to take after the establishment of the new republic to declare their loyalty to the new order. This was a challenging situation for royalist supporters, many of whom were ejected from their livings due to their refusal to take the oath. In various other cases, royalists (including Hobbes's friends, the earl of Devonshire and Sir Charles Cavendish) had their estates sequestered, with the new authorities insisting that they should “compound” – that is, pay money to the parliamentary government – if they wanted to get them back.

Emphasizing the significance of self-preservation, Hobbes's discussion in *Leviathan* suggests that one's change of allegiance from an old authority to a new one is a rational action. A sovereign, he argues, is no longer sovereign when he fails to protect the population and thereby subjects have no obligation to give obedience to him, but may consent to obey whoever has been invested with sovereign power, such as a conqueror. As becomes clear in this work, Hobbes's discussion of sovereignty concerns not only monarchy as he also refers to the possibility of its being exercised by an assembly of men. On the basis of this theory, the royalists' change of allegiance and their declaration of loyalty to the new Commonwealth should be seen as a rational and fully justified action. A few years later, Hobbes remarked that his book was written for “those many and faithful Servants and Subjects of His Majesty” who had to negotiate with the new authorities; those who “had done their utmost endeavour to perform their obligation to the King, had done all that they could be obliged unto; and were consequently at liberty to seek the safety of their lives and livelihood wheresoever, and without Treachery” (quoted in Malcolm 1996, 32).

While this argument in *Leviathan* might have been welcomed by a number of royalist supporters at the time, it of course displeased Charles II, the son of the executed King Charles I who had been Hobbes's pupil in Paris and to whom Hobbes presented a manuscript copy of the book. It should also come as no surprise that Charles II's Catholic mother, Henrietta Maria, and those around her in the exiled court in Paris, should have been offended by *Leviathan*'s fierce critique of the Catholic church – an element that also put Hobbes into trouble with the Catholic clergy in France. Having been barred from the exiled English court, Hobbes fled from Paris near the end of 1651 and arrived in London early in 1652.

Back in England, Hobbes soon got back in the service of the Earl of Devonshire. His employment probably did not include much more than light secretarial duties, so he had ample time to continue his intellectual pursuits and managed after years of delay to finally publish the two

remaining parts of his tripartite philosophical project, *De corpore* (1655) and *De homine* (1658). He spent a great part of his time in London, so he had the opportunity to enjoy the company of a number of prominent intellectuals of the day, such as the lawyers John Selden and John Vaughan, and the physicians William Harvey and Charles Scarborough. Also, he came back into contact with Sir Charles Cavendish and was acquainted with various more unorthodox circles, such as those around Thomas White (the Catholic Aristotelian philosopher and author of the scientific-theological treatise *De mundo* that Hobbes had refuted in the 1640s in a manuscript that remained unpublished until 1973) and John Davies (whose unauthorized publication of Hobbes's *Of Libertie and Necessitie* in 1654 included a fiercely anti-clerical preface).

At the same time, Hobbes started to attract the enmity of many of his contemporaries due to the publication of *Leviathan*. These included members of the clergy – Anglican, Presbyterian, as well as Catholic – who not only found many of the arguments made in *Leviathan* deeply unorthodox but were also troubled by Hobbes's fierce attack on priestly authority. Further, Hobbes received a hostile treatment by leading scholars at the universities (such as the Oxford scientists Seth Ward and John Wilkins), who were offended by his critique of these institutions in *Leviathan*. This critique “became suddenly topical when a proposal was made in the Barebones Parliament in 1653 to abolish [the universities] altogether” (Malcolm 1996, 34). The enmity of leading scientists of the day probably contributed to Hobbes's exclusion from the Royal Society when it was instituted in 1660, though, as has been suggested, his exclusion was probably due not so much to this factor or indeed to the incompetence of some of Hobbes's mathematical work (especially as found in *De corpore*), but to the fact that “the aura of religious notoriety clinging to Hobbes meant that any public association with him would be a source of embarrassment to the active members of the Royal Society” (Malcolm 1996, 35).

Following the restoration of the monarchy in 1660, he managed to re-ingratiate himself with

Charles II, who also gave him a generous pension of about £100 per year (albeit temporarily) as well as the privilege of free access to his person. However, in this period Hobbes came to be increasingly attacked by many for allegedly being an amoral atheist who denied the existence of objective moral values and, according to John Aubrey's biography of Hobbes in *Brief Lives*, in the early 1660s “some of the bishops made a motion to have the good old gentleman burn't for a heretique” (quoted in Skinner 2002, 27). In 1666, a committee was set up by Parliament to “receive Informacion toucheing such books as tend to Atheisme Blasphemy or Prophanenesse or against the Essence or Attributed of God. And in perticular . . . the booke of Mr. Hobbs called the *Leuiathan*” (quoted in Malcolm 1996, 37). Thus, much of Hobbes's intellectual energy was spent on defending himself from such charges, and his anxiety over this issue led to the writing of a number of texts, such as his *Dialogue between a Philosopher and a Student of the Common Laws of England* (posthumously published in 1681), *Mr. Hobbes Considered* (a short autobiographical text published in 1662), his *Historical Narration Concerning Heresy, and the Punishment Thereof* (posthumously published in 1680), and an appendix to the Latin edition of *Leviathan* (published in 1668), part of which aimed to respond to the charges of heresy and expose the absurdity of seeing heresy as a crime.

Hobbes's writings during this period, however, did not only concentrate on heresy. Besides the texts mentioned above, he also wrote and published various other texts that continued his long-standing contribution to some of his main areas of interest. He did further work on geometry and published in 1666 *De principiis et ratiocinatione geometrarum*. But more importantly, Hobbes continued his contribution to the field of civil science, first with the writing of his four dialogues on the English civil wars titled *Behemoth*. Evidence suggests that a draft of this text was finished in 1666 and that Hobbes revised it for publication in 1668, but failed to have it printed as he did not manage to persuade Charles II to license it. *Behemoth* eventually appeared in a pirated edition in 1679. Hobbes also set his mind

to producing a Latin edition of *Leviathan* (published, as previously mentioned, in 1668). This edition presents a number of significant departures from the English version, especially as it contains various deletions (mainly of points where he had mocked the Christian mysteries) and additions (such as the abovementioned appendix). Immediately after his completion of the Latin *Leviathan* and in response to Bramhall's *The Catching of the Leviathan* (1668), Hobbes wrote *An Answer to a Book Published by Dr. Bramhall*. This text brought to its close an intense period of productivity for Hobbes.

Hobbes's productivity and intellectual vigor during this period appear all the more remarkable, not only because of his advanced age but also because he suffered from the "shaking palsy," a severe disease (probably Parkinson's) that from 1656 onward rendered him unable to write and forced him to have to rely on the services of an amanuensis. The extraordinary force of Hobbes's intellectual achievement in his old age is also testified by the fact that – despite an illness that left him nearly dead in 1668 – he continued being productive until the very end of his life. In the 1670s, he turned his attention back to the humanistic studies that shaped his youthful years. In 1673, he published *The Travels of Ulysses* (a translation in English verse of the last four books of Homer's *Odyssey*), and then in the following year, he produced English versions of the entire *Odyssey* as well as the *Iliad*. Finally, in 1679 he published his autobiography in Latin verse. In October of that year, he fell seriously ill. He died at Hardwick Hall, Derbyshire, on 4 December 1679, at the advanced age of 91, having suffered a stroke a week before his death.

Heritage and Rupture with Tradition

It has often been argued that Hobbes's philosophical thought was shaped by the massive outburst of scientific enquiry that marked the intellectual climate of the seventeenth century. However, as has also been suggested, Hobbes's early intellectual development, before his firm turn to the sciences (natural and moral) in the 1630s, was

shaped by the culture of humanism and humanist studies (see, for instance, Tuck 1989, 1–11). Indeed, a great part of his studies up to that point (i.e., up to his early fifties) was based on what P. O. Kristeller once identified as the five elements of the *studia humanitatis* – grammar, rhetoric, history, poetry, and moral philosophy (Kristeller 1961, 22). On this basis, Hobbes was not so much "a product of the scientific culture to which he later contributed so extensively, but rather ... a student and exponent of the predominantly literary culture of humanism" (Skinner 2002, 38). Ironically, he was later to repudiate some of the basic tenets of the *studia humanitatis*, and the philosophical ideas for which he would become most well-known would be based on a direct dismissal of classical philosophy, especially of Aristotle.

Hobbes received rigorous training in the *studia humanitatis* early in his life, through the education he acquired as a grammar school boy in Elizabethan England. The classical humanistic syllabus typically concentrated on the two main elements of grammar and rhetoric. According to John Aubrey's biography of the philosopher, Hobbes was given such a remarkable level of proficiency in the classical languages, Greek and Latin, by his schoolmaster Robert Latimer, that "before he went to the University, he had turned Euripidis Medea out of Greeke into Latin iambiques, which he presented to his master" (quoted in Skinner 2002, 39). The syllabus on the second primary element, rhetoric, would typically include the major classical treatises on the art of rhetoric, especially Cicero's *De inventione* and *De oratore*, as well as Quintilian's *Institutio oratoria*. These works reflected on the nature of civil science and emphasized the significance of rhetoric in the life of the good citizen. For instance, in *De inventione*, Cicero's examination of the qualities one must possess in order to give advice to his fellow citizens on the matter of how to live together in peace leads him to argue that the ideal citizen must possess two important elements: first, wisdom and the power to reason so as to find out the truth, and then, eloquence so as to persuade others of that truth. In this discussion, wisdom and the power of reason are described as largely

ineffective in the absence of eloquence, thereby establishing rhetoric (i.e., the art of adorning the truth so as to convince others) as an indispensable element, especially for the participation of the citizen in public assemblies and law courts. But, as Quintilian reminded his readers, in assemblies as well as in law-courts, rhetorical arguments could be used “in utramque partem,” that is, “on either side of the case” and in such cases, it is practically impossible to prove beyond question which side is in the right (Skinner 2002, 71). Thus, the ability to “speak on either side of the case” came to be defined by Quintilian as well as Cicero as the highest element in the art of rhetoric. (As we shall see, Hobbes was to launch his own philosophical ideas on civil science by repudiating the basic premises advocated in these classical handbooks on the art of rhetoric.)

Besides grammar and rhetoric, Hobbes’s training in the *studia humanitatis* would also include the other three disciplines of the classical humanistic syllabus, namely history, poetry, and moral philosophy. His preoccupation with all five elements of the *studia humanitatis* continued well after his years as a grammar school boy, more so after his first visit to the Continent with the young Cavendish and his return to England in 1615. He devoted a great part of his time (especially in the 1620s) to the study of classical poetry, reading such poets as Horace, Virgil, and Homer, as well as dramatists like Euripides, Sophocles, Plautus, and Aristophanes. At the same time, he engaged in the study of history: evidence suggests that besides Thucydides – whose history, as already mentioned, he translated directly from the Greek (a translation published in 1629) – he also read such classical historians as Sallust and Plutarch. His studies after his return to England in 1615 were rounded off with an exploration of moral and civil philosophy. His reading in this discipline included such texts as Justus Lipsius’s *De doctrina civili*, but also works produced closer to his own time, such as Thomas More’s *Utopia*, Jean Bodin’s *Six Livres de la République*, and Francis Bacon’s *Essays* (Skinner 2002, 44).

Hobbes’s preoccupation with the *studia humanitatis* continued well into the 1630s, during the years he served as tutor to the young William

Cavendish, third earl of Devonshire. Though it appears to have included some logic, arithmetic, geography, and geometry, the syllabus he devised for the young boy was primarily based on the *studia humanitatis*. So Hobbes himself continued his studies in this field along with his student. Hobbes’s writings during this period also reflect the central position that he gave to humanistic studies. Besides his translation of Thucydides’s history, he also paraphrased in Latin Aristotle’s “*Art*” of *Rhetoric*; an English version of this work was subsequently published (anonymously) as *A Briefe of the Art of Rhetorique* (c. 1637), a work that provided the first printed English version of Aristotle’s “*Art*” of *Rhetoric*.

However, *The Elements of Law* and *De cive* both point to Hobbes’s subsequent repudiation of some of the basic tenets of humanist learning, more specifically of classical notions about rhetoric, in his attempt to establish the unshakeable foundations of civil science. The title Hobbes chose for *The Elements of Law* – which evokes the title of the first English translation of Euclid’s treatise on geometry, namely *The Elements of Geometry* (published in 1571) – is in itself suggestive as it would serve “to associate his own treatise in the minds of his readers with one of the most celebrated works of deductive reasoning ever written” (Skinner 2002, 75). Also, in his dedicatory epistle, Hobbes explicitly challenges the assumptions of such classical theorists as Cicero and Quintilian who argued that reason unaided by rhetoric is ineffective as it does not have the power to persuade, suggesting that his own work lays down the foundations for the establishment of a civil science the conclusions of which cannot be contested as they are based on “the rules and infallibility of reason” (Hobbes 1994, 19). Likewise in *De cive*, the first edition of which appeared 2 years later, he highlights that his own ambition is to persuade his audience “not by any outward display of *oratio* but rather by the firmness of *rationes*” (transl. Skinner, in Skinner 2002, 76).

In *Leviathan*, Hobbes appears to reevaluate his former outright rejection of rhetoric as he comes to acknowledge that people are not always prepared to accept the otherwise infallible conclusions reached by reason. Yet, his critique of

classical political philosophy (or, moral philosophy, as he usually calls it) extends beyond this particular point and in *Leviathan* he continues to denounce some of the most important tenets of classical political philosophy. The traces of this denunciation may be found in *De cive* where Hobbes describes all moral philosophy prior to his own, and more specifically classical philosophy, as the source of conflict, sedition, and ultimately chaos and violence. This description is largely based on classical philosophers' advocacy of the idea that tyrannicide is not only licit but even praiseworthy. Held by many in his own days, this "seditious doctrine," as Hobbes calls it, was advocated "of old . . . by all the philosophers, Plato, Aristotle, Cicero, Seneca, Plutarch, and the rest of the maintainers of the Greek and Roman anarchies" who believed that it was "not only lawful, but even worthy of the greatest praise" (Hobbes 1991, 246). Hobbes refers to how dangerous he considers this doctrine to be, highlighting his disapproval of the notion that private men should be entitled to judge the justice of the actions of kings as this could easily lead to chaos. As he argues in *Behemoth*, such political teachings ultimately contributed to the eruption of the civil war in England in the 1640s as they led "an exceeding great number of the better sort" who had read "books written by famous men of the ancient Grecian and Roman commonwealths concerning their polity and great actions; in which books the popular government was extolled by the glorious name of liberty, and monarchy disgraced by the name of tyranny" to fall "in love with their forms of government" (Hobbes 1990, 3). Elsewhere in *Behemoth*, reference is made to how "the democratical principles of Aristotle and Cicero," so warmly embraced by many members of the Long Parliament, led to "the rebellion we now talk of" (Hobbes 1990, 43).

As has often been pointed out, Hobbes's denunciation of classical philosophy frequently concentrated on Aristotle (see, for instance, Sorell 1999). Indeed, in many cases, Hobbes refers to the classical philosopher with outright contempt – even though, as has been argued, in some of his works he actually depended strongly on Aristotle (Leijenhorst 2002). His denunciation of Aristotelian philosophy is clearly expressed in *Leviathan*

where he states that "scarce any thing can be more absurdly said in naturall Philosophy, than that which now is called *Aristotles Metaphysiques*; not more repugnant to Government, than much of that hee said in his *Politiques*; not more ignorantly than a great part of his *Ethiques*" (Hobbes 1996, 461–62). Expressing his strong disapproval for the central position given to Aristotelian philosophy in university curricula, he also notes disparagingly that what was taught there was "not properly Philosophy . . . but Aristotelity" (Hobbes 1996, 462). For Hobbes, Aristotelian thought had a detrimental impact, not only with regard to the development of political philosophy in the period that preceded him but also with regard to the political situation in his country as it developed in the 1640s.

One of the most important points in Hobbes's critique of Aristotle concerns the "doctrine of abstract essences" – that is, the theory "according to which there are in the world certain essences separated from bodies and thus beings with an incorporeal existence" (Stauffer 2016, 488). Tracing its origin back to Aristotle, Hobbes launches a sustained attack against this idea. For him, the idea of incorporeal existence was particularly dangerous, especially due to the political danger it entailed. As he argues, belief in the doctrine of abstract essences strengthens the power of religious authorities that "can challenge the temporal power in the name of a higher spiritual kingdom" (Stauffer 2016, 488). Therefore, it serves to deplete subjects' obedience to civil authority. As he suggests in *Leviathan*, in order for political stability to be ensured men should "no longer suffer themselves to be abused, by them, that by this doctrine of *Separated Essences*, built on the Vain Philosophy of Aristotle, would fright them from Obeying the Laws of their Countrey, with empty names" (Hobbes 1996, 465). In response to the doctrine of abstract essences, Hobbes provides a powerful statement of his own belief in materialism, asserting that "The World (I mean not the Earth onely . . . but the *Universe*, that is, the whole masse of all things that are) is Corporeall, that is to say, Body" (Hobbes 1996, 463).

Another important point in Hobbes's critique of Aristotle concentrates on the issue of human nature and the extent to which human beings are

by nature fit for society. Hobbes's discussion of human nature strikingly rejects the idea that man is naturally social – an idea famously expressed by Aristotle in *Politics* where he asserts that man is by nature a political animal. For Hobbes, “the naturall condition of mankind,” namely the condition in which human beings find themselves in the absence of a common power to keep them all under submission (Hobbes 1996, 86), is a condition of “warre, as is of every man, against every man” (Hobbes 1996, 88):

In such condition, there is no place for Industry; because the fruit thereof is uncertain: and consequently no Culture of the Earth; no Navigation, nor use of the commodities that may be imported by Sea; no commodious Building; no Instruments of moving, and removing such things are require much force; no Knowledge of the face of the Earth; no account of Time; no Arts; no Letters; no Society; and which is worst of all, continuall feare, and danger of violent death; And the life of man, solitary, poore, nasty, brutish, and short. (Hobbes 1996, 89)

This largely unappealing view of the state of nature is explained by Hobbes on the basis of his belief in the natural equality of humankind – an idea that he defines in terms of the equal capacity human beings have to destroy and kill each other irrespectively of whatever differences there may be in their physical or mental condition. By implication, Hobbes suggests that human beings are naturally prone to antisocial competition and conflict as the natural equality they have in their capacity for mutual destruction makes them all entertain equal hopes in the pursuit of their ends (Hobbes 1996, 87). As he claims, it is largely due to the fear they feel in this condition, and due to their desire for conveniences they cannot secure in the state of nature, that human beings are prompted to seek peace (Hobbes 1996, 90).

Hobbes further highlights his disagreement with Aristotle's view of human nature by suggesting that in their natural condition men even compare unfavorably with certain kinds of animals such as bees and ants which “Aristotle numbred amongst Politicall creatures” (Hobbes 1996, 119). Launching a comparison between the two, he ultimately concludes that “the agreement of these creatures is Naturall” whereas “that of men, is by Covenant only, which is Artificiall”

(Hobbes 1996, 120). Such a covenant appears to be the only way for human beings to escape the constant war of all against all that defines the state of nature and to safeguard what Hobbes calls the “Right of Nature,” the inalienable right of each individual has to self-preservation (Hobbes 1996, 91). But the constancy and longevity of the agreement can only be achieved by the establishment of “a Common power” that will “keep [the people] in awe, and . . . direct their actions to the Common Benefit” (Hobbes 1996, 120). For Hobbes, such a common power can only be established if people agree “to conferre all their power and strength upon one Man, or upon one Assembly of men, that may reduce all their Wills, by plurality of voices, unto one Will” (Hobbes 1996, 120).

The outcome of this process whereby the multitude unites itself into a single person is the establishment of the Commonwealth: “This is the Generation of that great LEVIATHAN, or rather (to speake more reverently) of that *Mortall God*, to which wee owe under the *Immortal God*, our peace and defence” (Hobbes 1996, 120). Hobbes's employment of the figure of Leviathan (the biblical sea monster found in such places as the Book of Job) to refer to the commonwealth is in many ways significant. This figure – powerfully represented in the famous frontispiece of Hobbes's book by Abraham Bosse – no doubt evokes the terror Hobbes's sovereign is expected to produce so as to be able to maintain internal peace but also to protect the commonwealth from its external enemies. This also points to one of the greatest ironies in Hobbes's theory of human nature and the state: that in order to avoid the fearful condition in which they find themselves in the state of nature, human beings must live under the greatest terror caused by the Leviathan.

Innovative and Original Aspects

As previously mentioned, Hobbes's career from the 1640s onwards (following the completion of his manuscript treatise on optics, the so-called Latin Optical MS) was marked by “an acrimonious dispute” between him and Descartes “about who had preempted – or even plagiarized – whom” (Malcolm 1996, 26). Hobbes – who

must have been devastated by the fact that some of his own thoughts were “preempted in print” by someone else (Malcolm 1996, 26) – persistently defended his claims to originality by arguing that he was the one who first introduced the idea that “light is a fancy in the minde, caused by motion in the braine, which motion againe is caused by the motion of the parts of such bodies as we call *lucid*” and drawing his readers’ attention to the possibility that, since the same ideas appeared in print by another author, he “might be challenged for building on another man’s [Descartes] ground” (quoted in Rogers 2007, 421).

Yet, the extent of Hobbes’s originality in the field of optics and physics (more specifically on the origin of light and sensation) and the question of whether he owed an intellectual debt to Descartes are rather difficult to ascertain. While an answer might be found in an earlier treatise attributed to Hobbes, the so-called Short Tract, the authorship of this text remains unresolved. No matter what the answer to this question may be, Hobbes appears to have advanced his mechanical account of the universe before he was exposed to Descartes’s work (Rogers 2007, 421–2). Also, a fine yet important distinction between Hobbes’s understanding of motion and the nature of sensation and that of Descartes as well as Galileo points to the originality of his thought: “For Hobbes, it is not just the case the motion is the *cause* of sensation, a position accepted by Galileo and Descartes, but that sensation is itself a motion, a physical change in the brain” (Rogers 2007, 415–16).

Hobbes’s own estimation of his contribution to the field of political philosophy is no less modest than his claims about his contribution to physics. He often reiterates the idea that he is not just “*the* founding father . . . of modern political philosophy but of political philosophy as a genuine science” (Stauffer 2016, 481). For example, in his Epistle Dedicatory to *The Elements of Law*, he claims that his work provides “the true and only foundation of such Science” (Hobbes 1994). Similar claims are made in the *Leviathan* where he sets out to illustrate the benefits of a “Morall and Civill Science” that will enable people to cast aside the “multiplying glasses” they have by nature been invested with (namely, their “Passions

and Selfe-love”) so as “to see a farre off the miseries that hang over them” (Hobbes 1996, 129).

As has been suggested, one could perhaps challenge Hobbes’s estimation of the groundbreaking contribution of his work. For instance, scholars have pointed to the ways in which Machiavelli’s philosophical thought laid the ground for the development of Hobbes’s political philosophy (e.g., Strauss 1953, 177–9). Even so, as has been noted, “it is in Hobbes, more than in any other modern thinker, that we can see the full dimensions of the rejection of the classical tradition and the revolutionary attempt to put political philosophy on a new foundation” (Stauffer 2016, 481). Indeed, Hobbes’s repudiation of the classical tradition (examined in greater detail in the previous section) led to the development of a new science of politics, the innovative aspects of which cannot be discounted. For example, while rejecting the Aristotelian notion of man as a political animal, his take on mankind in the state of nature was also strikingly different “from the prevailing contemporary view,” according to which “in his natural condition man was as created by God and before his corruption by Adam’s sin . . . in scholastic terms, man’s natural condition is that which accords with his natural *telos* or end” (Hoekstra 2007, 111). No doubt, there is a sharp contrast between the portrait of this condition, which many of Hobbes’s contemporaries thought they could regain through religious redemption, and his depiction of the state of nature.

Further, one of Hobbes’s most important contributions in his advancement of a new science of politics concerns his reconceptualization of the state as a purely artificial person who has been authorized to represent the unified body of the people. As he notes in his letter to Francis Godolphin that prefaces *Leviathan*, “I speak not of the men, but (in the Abstract) of the Seat of Power” (Hobbes 1996, 3). Also, as he states in his Introduction to the book, the state or the great Leviathan is “an Artificiall Man; though of greater stature and strength than the Naturall, for whose protection and defence it was intended; and in which, the *Soveraignty* is an Artificiall *Soul*, as giving life and motion to the whole body”

(Hobbes 1996, 9). The ideas presented here were more fully developed in Chapter 16 of *Leviathan*, entitled *Of Persons, Authors and Things Personated*, where Hobbes advances the concept of authorization, on the basis of which an action performed by a person is validly attributed to another person when the latter (the “author”) has duly authorized and commissioned the former (“the actor”) to perform the said action as his representative (Hobbes 1996, 112).

Discussed as “arguably . . . his most original contribution to the theory of the state” (Skinner 2002, 183), the concept of authorization has a far-reaching significance for Hobbes’s reconceptualization of the artificial person of the state. The important political implications of the discussion of his concept of authorization start becoming clear when he talks about the way in which the multitude is unified into a single person to establish the commonwealth. As Hobbes explains in Chapter 17 of *Leviathan*, this is achieved precisely on such an act of authorization – more specifically, on a covenant that involves simultaneous acts of authorization whereby the people all transfer their rights of governing themselves to a single person. This “Covenant of every man with every man” is of “such manner, as if every man should say to every man, *I Authorize and give up my Right of Governing my selfe, to this Man, or to this Assembly of men, on this condition, that thou give up thy Right to him, and Authorize all his Actions in like manner*” (Hobbes 1996, 120).

The full implications of this description – which provides the basis for Hobbes’s contract theory – are unraveled in the following chapter of *Leviathan*. First, the subjects do not have the right to change the form of government; secondly, sovereign power cannot be forfeited, since the sovereign can never be accused of being in breach of the covenant: “Because the right of bearing the Person of them all, is given to him they make Sovereigne, by Covenant onely of one to another, and not of him to any of them; there can happen no breach of Covenant on the part of the Sovereigne” (Hobbes 1996, 122). Thus, in stark contrast to the neo-republican theory proposed by other seventeenth-century figures who argued that the

power of the sovereign was based on the people’s consent and was therefore revocable, Hobbes describes a social contract that is based on the agreement of the people but is nevertheless irrevocable. Also, as a direct consequence of Hobbes’s theory of authorization, the sovereign cannot be justly accused by his subjects for any of his actions as all of the sovereign’s actions are understood to have been authorized by the subjects (Hobbes 1996, 124). On this basis, the sovereign cannot be punished.

Impact and Legacy

Hobbes’s works had a significant impact on seventeenth-century thinkers, though the attention he received from many of his contemporaries was negative. Indeed, as has been suggested, “Hobbes generated more hostile literature than any other thinker in the seventeenth century” – so much so that “if judged by the number of hostile books and pamphlets he generated, he may well be the most maligned philosopher of all time” (Rogers 2007, 413). Nevertheless, many of his ideas (more prominently his political theory) were so influential for subsequent thinkers that he came to be acknowledged and is still recognized as one of the most important philosophers of all time, on a par with such figures as Plato, Aristotle, Machiavelli, Locke, Hegel, Marx, and Mill.

The reception of Hobbes’s philosophy by his contemporaries and near-contemporaries was complex: while admired by some for the intellectual power of his ideas, he was vilified by others as a highly unorthodox and politically dangerous thinker who embraced atheism and moral relativism. His first work to have had an impact on his contemporaries was *The Elements of Law* (1640), a book that made known his views in support of an absolute monarchy, but also led to his being considered by many of his contemporaries as an atheist, especially due to his articulation of materialism therein.

While this work, which circulated only in manuscript at the time, mainly reached an English-speaking audience, Hobbes’s ideas were introduced to a much broader audience with the

publication of *De cive* (especially with the second edition of the book in 1647). This firmly established Hobbes in Continental Europe as one of the leading intellectuals of the day. In Paris, several prominent philosophers (e.g., Pierre Gassendi) recognized him as an important thinker. However, Hobbes fared less well with his fellow-countrymen: while he was acknowledged by some (e.g., Newcastle and Kenelm Digby), he was seen by many others with considerable skepticism and hostility (especially within the exiled court of the English king and his Catholic wife).

This hostility increased after the publication of *Leviathan*. In England, Hobbes found strong opponents especially among the clergy and university teachers, but also among the lawyers (Mintz 1962, 46). The attacks against Hobbes concentrated with ever greater vehemence on such issues as his materialism. The clergy was also greatly offended by his take on religion and his suggestion that ultimate authority on religious matters should belong to the sovereign rather than the church. Many of his opponents also concentrated on his “apparent moral relativism” (Rogers 2007, 418), finding grounds for this charge in his account of human nature in *Leviathan*, where good and evil or justice and injustice are described as relative concepts the meaning of which cannot be defined on the basis of any objective criteria. The criteria for these, Hobbes suggests, can only be fixed upon the establishment of the social contract and a common power that will enforce them (Hobbes 1996, 90). All of these fueled with ever greater urgency the accusation of atheism against Hobbes and a relevant report was made to a parliamentary committee in 1657, though this did not result in any official kind of censure (Parkin 2007, 446). These were only some of the accusations brought against Hobbes, who was also castigated, among other things, for such issues as his legal positivism and his attitude toward the universities. Indeed, as has been pointed out, “one might say that if Hobbes had set out deliberately to offend his fellow countrymen, it is difficult to see how he could have been more successful” (Rogers 2007, 425).

The hostile attitude against Hobbes appears to have intensified after the Restoration of kingship

in 1660 when many of his opponents re-established themselves in positions of power. Following the investigation against him for atheism by Parliament in 1666 (see “[Biography](#)” above), there was also “in 1668 the rumour that the Bishops would not allow *Leviathan* to be printed again” which “sent Samuel Pepys scurrying off to invest in an expensive second-hand copy” (Parkin 2007, 448). A number of books contributed to Hobbes’s vilification during this period, such as Thomas Tenison’s *Creed of Mr. Hobbes Examined* (1670) and John Eachard’s *Mr. Hobbs’s State of Nature Considered* (1672). Thus, gradually Hobbism came to be used as a term of abuse, and Hobbes came to be seen by many as “the Monster of Malmesbury” (Rogers 2007, 426).

Yet Hobbes also had a number of good friends and admirers, including the Cavendish family, which gave him continued support until his death. He also enjoyed the friendship of the lawyer John Vaughan and the antiquary and scientist John Aubrey, who wrote a glowing biography of Hobbes in his *Brief Lives*. Also, the popularity of *Leviathan* kept increasing despite its condemnation by many of its critics, and there was ever greater demand for the book that was published many times, in some cases even secretly (Mintz 1962, 61). Indeed, Hobbes’s work appears to have had a far-reaching influence on many of his contemporaries (although they did not always acknowledge their intellectual debt to him). Also, modern scholarship may have over-emphasized Hobbes’s unpopularity (Skinner 1966, 288; Malcolm 1996, 37). Following the death of Pierre Gassendi in 1655, various Frenchmen (such as Samuel Sorbière, Thomas de Martel, and Abraham du Prat) considered Hobbes “as the greatest living philosopher, and told him in their letters that they eagerly read every new work of his that they could obtain” (Malcolm 1996, 37).

His correspondents also included François du Verdus who set himself down to learn English so as to produce a French translation of *Leviathan* (a project that never came to fruition). Also, Samuel Sorbière published in 1668 a collection of the philosopher’s Latin works (including Hobbes’s Latin *Leviathan*) – an edition that contributed

(together with the various re-printings of *De cive*) to the broader dissemination of Hobbes's philosophy in continental Europe. Also influenced by Hobbes were the Dutch philosopher Baruch Spinoza and the German philosophers Samuel von Pufendorf and Gottfried Wilhelm Leibniz (Leibniz in particular during the formative years of his philosophical career in the late 1660s and early 1670s). Hobbes's ideas continued to bear fruit in the development of political philosophy from the late seventeenth century up to the present, especially in the fields of contract theory and theories of sovereignty and the state. Scholars have traced his influence on (among others) John Locke, on the origins of the Enlightenment (e.g., Kraynak 1990), and on twentieth-century theoreticians of sovereignty and the state (e.g., Carl Schmitt).

Holanda, Francisco de

Born: 6 September 1517/18, Lisbon

Died: 19 June 1584, Lisbon

Jeremy Roe

CHAM, FCSH, Universidade Nova de Lisboa,
Lisbon, Portugal

Abstract

Francisco de Holanda played a seminal role in the transmission of the humanist discourse on art and architecture to Portugal through both word and image. A key testimony to his entwined artistic practice, literary writing, and intellectual thought is provided by his five extant manuscripts. They underscore how Holanda mastered a range of visual and literary genres of intellectual discourse.

Synonyms

[Francisco d'Olanda](#)

Biography

Francisco de Holanda was trained as an illuminator by his father, António de Holanda. His artistic study was complemented by the humanist education he received as a page at the court of John III in Évora from scholars

including André de Resende, who had studied in Paris, Louvain, and Brussels. Resende's erudition was complemented by Miguel da Silva's extensive knowledge of Italian humanist culture. Da Silva's knowledge of Rome's cultural legacy and scholarly community provided an invaluable stimulus for Holanda's journey to Rome, which provided the culmination of his education.

Holanda left for Rome in early 1538. Da Silva would have provided the youthful Holanda with introductions to key cultural figures, whereby he met Michelangelo and Vittoria Colona. While visiting Venice, he also met Serlio who presented him with his *Regole Generali d'architettura*. Before leaving for Rome, Holanda was commissioned to document the fortifications he saw and this prompted the creation of the collection of 112 watercolor drawings known as the *Antigualhas*. Holanda completed his original commission, but augmented it with depictions of classical architecture, painting, and sculpture as well as allegories of his own invention. In addition to his evident artistic skill, these drawings testify to his understanding of the intellectual significance of both classical and renaissance art and architecture, a theme he addressed in a second manuscript, *Da Pintura Antiga*, written on his return to Portugal in 1540.

Da Silva was living in exile in Rome by then and his name goes unmentioned in *Pintura*, which was dedicated to John III. Nonetheless, Holanda's ideas and literary choices indicate his mentor's influence. Charles Hope has discussed the philosophical dimensions of his treatise, and although the discussion is not that of a "professional philosopher" it highlights both Holanda's intellectual interests and the input of other scholars (Holanda 2013, 57). The second book of his treatise consists of four dialogues emulating Castiglione's *Il Cortigiano*, which Deswarte-Rosa has referred to as his "bedside reading" (Deswarte-Rosa 1989, 179). Although Holanda's dialogues are a fictional conceit for his reflection on diverse aesthetic issues, they testify to his participation in Rome's literary milieu. He also addressed aspects of artistic practice, and subsequently wrote *De tirar polo natural* (1549), a treatise on portraiture.

As his career progressed, Holanda undertook artistic commissions and civic and military

architectural projects. *Da fábrika que falece à cidade de Lisboa*, one of his two final treatises, was intended to promote the continuation of an architectural program for Lisbon he had initiated in the 1540s. *Fábrika* was accompanied by *Da ciência do desenho*, which offers an insight into the diverse tasks he undertook as a courtier and artist. It also signals how his life and ideas were increasingly influenced by the political situation in Portugal following the death of John III in 1557. *Ciência* and *Fábrika*, completed in 1571, sought to remind the young King Sebastian (1554–1578) of the importance of the visual arts. Yet, by that time, the Inquisition was paying closer scrutiny to humanist writing and the seemingly Neoplatonist aspects of *Ciência* were censored. Regrettably, two illuminated poetic works from the regency of the Cardinal Infante Henrique (1512–1580, regent 1562–1568) have been lost, but, a visual representation of his philosophical ideas, as well as his rich literary, theological, and classical knowledge is offered in another celebrated book of drawings, *De aetatibus mundi imagines*.

Aetatibus was completed in two stages: the first in 1551, and then in 1573 he added around one hundred further drawings. The book's Christian theme, signaling the onset of the counter-reformation, reveals a religious dimension of Holanda's humanism. His geometric renderings of the divine realm have been identified as evoking the divine realm of ideal Platonic forms; the use of allegory in a striking series of six drawings emulates representations of Petrarch's *Trionfi*, such as the woodcuts in the 1522 *Il Petrarcha*, dedicated to da Silva; and, his antiquarian rigor underpins his representations of biblical history. *Aetatibus*'s 154 drawings underscore how Holanda's intellectual concerns imbued his artworks, while also highlighting his *savoir faire* as a Renaissance courtier in the face of both his patrons, shifting intellectual and spiritual concerns, and the prospect of political change: once Philip II became king of Portugal in 1581, he presented him with *Aetatibus*, and in return, he received a pension for the final years of his life, whereby he ended his life as both a respected courtier and artist.

Impact and Legacy

The impact of Holanda's writings and artistic and architectural *oeuvre* is hard to gauge. With regard to Portugal *Natural's* fictional dialogue between Holanda and Bras Pereira Brandão signals the circulation of his ideas among his Portuguese peers. The significance of his architectural projects and ideas may be associated with the growing interest in Renaissance ideas signaled by John III's requests that Resende translate Alberti's *De re aedificatoria* and Pedro Nunes Vitruvius's *De architectura*. Holanda's renown spread to Spain; A Spanish translation of *Pintura* was made by Manuel Denis in 1563, and *Antigualhas*, as well as *Aetatibus*, entered the collection of Philip II. Denis's translation seems not to have been widely circulated, although it has been argued that Federico Zuccaro may have read it while working in Spain (Deswarte-Rosa 1992, 224–235). An extant letter of Holanda's addressed to Michelangelo indicates that he maintained contact with the Rome's cultural milieu, and the fact that Michelangelo answered his request for a drawing by sending a drawing of a male nude, today conserved in the Hessisches Landesmuseum (Inv. A.E. 1280), signals the bond between the two artists (Deswarte-Rosa 1992, 138–139). Holanda's original manuscript of *Pintura* is untraced, but a copy made in Portugal in 1790 signals its value was not ignored. The scholarly study of Holanda was pioneered by Joaquim de Vasoncelos at the end of the nineteenth century.

Holste, Lukas

Born: 1596, Hamburg

Died: 1661, Rome

Irene Fosi

Università “Gabriele D’Annunzio”, Chieti-Pescara, Italy

Abstract

Considered among the greatest scholars of the seventeenth century, Lucas Holste (L. H.) (lat. Holstenius, it. Luca Holstenio) distinguished himself through his search for and study of manuscript and printed texts during visits and periods of research in the greatest libraries of Italy and Europe. After his conversion to Catholicism, he came to Rome (1627) where he put himself at the service of the Barberini and, in particular, of Cardinal Francesco. He established himself in Baroque Europe with scholarly studies in philology and antiquarianism but also through extensive geographical knowledge and his interest in naturalism.

Alternate Names

Biography

Born in Hamburg on September 27, 1596, into a family of humble origins, he studied first in the city of his birth, then in Rostock and, for around 6 years, in Leiden. At that university, he took an interest in Platonic philosophy. In 1618 he had traveled to Italy with Philipp Clüver, who had published his five-volume *Italia Antiqua* in Leiden in 1622. This experience stimulated his interest in geography and naturalistic studies. L. H. made numerous corrections to Clüver's work, which was published posthumously in 1666. In 1621 he accompanied the senator Kaspar Vosperg on a diplomatic mission to Denmark. Afterward, he spent more than 2 years in England; in London and Oxford, he frequented the most famous libraries, which he appreciated not only for the richness of their collections but also for their openness to scholars. After arriving in Paris, he entered the service of Henry de Mesmes as a librarian. After converting to Catholicism on December 15, 1624, he met Cardinal Francesco Barberini, who was in Paris trying to reach a diplomatic solution to the military and political dispute between France and Spain over Valtellina. L. H.'s conversion has been linked to the presence of Francesco Barberini in Paris, which offered him the opportunity to access the Roman court, erudite culture, and Italian antiquarianism. He arrived in Rome in 1627 and began an ecclesiastical career. He was nominated to the Accademia dei Lincei (1629) and began to play a part in the *famiglia* of Francesco Barberini who appointed him as his librarian (1636). His vast correspondence with figures of libertine erudition such as Nicolas-Claude de Peiresc, Gabriel Naudé, and Jacques and Pierre Dupuy, and with representatives of the seventeenth-century Italian culture, shows that it was not easy for him to adapt himself to the way of life at the Roman court, which he often criticized, even if he did so with cautious

prudence. Urban VIII appointed him protonotary apostolic and Canon of St Peter's and, for his cartographic expertise, entrusted him with the restoration of the paintings in the Gallery of Maps at the Vatican Library. L. H. corrected errors and commissioned more precise representations of ancient and modern Italy (Morello 2007). Innocent X made him the first keeper of the Vatican Library (1653), a role that he retained under Alexander VII. Disappointed with the lack of organization in Italian and Roman libraries, he sought to remodel them as "open libraries," experimenting with this project at the Vatican Library (Vian 2014). He carried out assignments and missions on behalf of the Barberini and Chigi popes: the most famous and celebrated of these is his presence in Innsbruck at the conversion of Queen Christina of Sweden, whom he then accompanied to Rome (1656). He recommended that Alexander VII acquire the library of the Duke of Urbino, which he visited during this journey (Vian 2014). On the death of Gaudenzio Paganini, Leopoldo de' Medici offered him the Chair of Humanities at the Studio di Pisa, but he declined (1648). His activity as a librarian and the frequent assignments entrusted to him by popes reduced the production and, above all, the publication of his works, which often remain incomplete and in manuscript. He died in Rome on February 2, 1666. He is buried in Rome in the Church of Santa Maria dell'Anima. In accordance with his last will and testament, L. H.'s library was left to the Roman Biblioteca Angelica for "public use" (Serrai 2000). Although L. H. did not claim to be a philosopher, thanks to his association with Daniel Heinsius, he was interested in ancient philosophy and Neoplatonism. This can be deduced from both his library and his correspondence with erudite friends. In the work *De vita et scriptis philosophi Porphyrii Dissertatio* (1630 and 1650), he sought to combine the Neoplatonism inherited from Renaissance humanism with the culture of the Counter-Reformation, without its controversialist overtones. In the biography of Porphyry, he presented the Neoplatonist as an independent philosopher and, sometimes, as a critic of Plato. This work contextualized Porphyry's *Contra Christianos*, the principal cause of the negative

reputation of the philosopher whom L. H. wanted to bring back to the attention of seventeenth-century literary culture (Varani 2014).

Homocentrism

Matteo Cosci

Università Ca' Foscari Venezia, Venice, Italy

Abstract

Homocentrism is that philosophical tendency that centers itself upon man as a finite subject who dominates his own history. According to an influent, albeit antiquate historiographical position which traces back to J. Burckhardt, Renaissance is *the* age of homocentrism and the first individualization of singular personalities with flourishing characters *par excellence*.

Synonyms

[Anthropocentrism](#); [Humanocentrism](#); [Individualism \(Renaissance\)](#); [Self and individual identity](#)

Heritage and Rupture with the Tradition

Commonly contrasted with theocentrism, homocentrism as a tendency of thought and action denominates those philosophical and theological conceptions which are grounded on a preeminent

consideration of men, in reference to whom every theoretical and practical perspective is referred: “homocentrism is that discursive formation which centres itself upon man as a finite subject who dominates his own history” (Lemert 1979, p. 16).

During the Renaissance in particular, the centrality of men as active and transformative force distinctively emerges as never before. Renaissance philosophy on the whole can be said to be *anthropological* as such, since its main interest is always centered on the pivotal role of man, both as individual and as mankind. In what has been often called the “manifesto of the Renaissance,” Pico della Mirandola advocated the human capacity of being *artifex* of own destiny and fortune (*Oratio de hominis dignitate*, 1486; Garin 1994). “Renaissance philosophy... transfers the Promethean power of giving form ever more to the individual subject; the activity of the individual is even juxtaposed to the activity of the Creator and to that of the Saviour” (Cassirer 1927/2000, pp. 108–109, in reference in particular to Boccaccio but also to Pico, Cusano, Ficino, Bruno, and others).

Renaissance has been regarded not only as of the age of emergence of homocentrism but also of the development of the individual character. The historiographical origin of this old conception can be found in the seminal work *Die Cultur der Renaissance in Italien* by Jacob Burckhardt (1860) and in particular in its famous chapter on *The development of the Individual*. He identified the cause of that fortunate conjunction in the deliverance that took place in Italy from the political constraints of the medieval and feudal age, in beneficial patronages of the arts and literary *otia* pursued by the tyrants and lords of the time, and finally in the exceptional nature of men endowed with polyvalent genius and free personality. “In Renaissance Italy – Burckhardt maintained – an objective treatment and consideration of the state and of all the things of this world became possible; the subjective side at the same time asserted itself with corresponding emphasis; man became a spiritual individual [*geistiges Individuum*], and recognized himself as such... then arose the “all-sided man” –

“*l'uomo universale*” – [e.g., Leon Battista Alberti, Benvenuto Cellini, Leonardo da Vinci]. In Italy at the time of the Renaissance, we find artists who in every branch created new and perfect works, and who also made the greatest impression as individual men” (Burckhardt 1860/1878, pp. 70; 73).

Along these lines, according to Federico Chabod, uninhibited “individualism” in practical philosophy (e.g., Machiavelli, Guicciardini) and politics (e.g., Francesco Sforza, Lorenzo de' Medici, Cesare Borgia) should be intended, together with artistic “realism,” as one of the most representative traits of that “reality of the spirit” that we call Renaissance. The discontinuity in respect to the Middle ages on these issues did not regard their presence, common to both periods, but rather the attitude with which they were pursued, now not necessarily religious in their intentions. In fact, “realism and individualism, as love for glory and imitation of ancient culture (Borinski 1919, pp. 20–21), were accepted also in the Medieval life, but just as particular steps for a higher purpose; on the other hand, in the Renaissance times those attitudes were pursued freely, as an end in themselves” (Chabod 1948, p. 79). Renaissance historiography, for example, started to describe the evolution of events neither as the realization of a divine unknown plan nor as the fight against the contrivances of evil but rather as the fruit of the determination of human will, the immediate author of all actions and choices. Also, art and poetry started to be made for the glory of men, *in primis* the poets and artists themselves and possibly their patrons, rather than for the glory of God. The fading away of the previous collective religiosity in favor of a new self-centered humanism was recognized as due to the fact that in European history, between the fourteenth and the fifteenth century, aggregating global forces as papacy and the empire collapsed in favor of the formations of fragmented national states and local feuds. As in Burckhardt's view, it was the political fragmentation that inevitably triggered social individualization.

Other historians have emphasized the inner aspect of Renaissance homocentrism, since apparently “the early Renaissance – again largely

through Petrarch's example and the resuscitation of Augustinian considerations, invents the notion of the inner self" (Kirkpatrick 2002, p. 126). Renaissance homocentrism and the development of an unprecedented notion of the inner self have been related also to the rise of autobiographical writings or private memories in secular literature (coupled with the invention of the printing press), so as to the spread and use of personal mirrors, now possible because of improvements in the glassmaking manufacturing (MacFarlane and Martin 2002, pp. 70–72).

Burckhardt/Chabod's interpretation of Renaissance homocentrism has been criticized at length, as anachronistic, bourgeois, and unaware of the social framework in which the process of individualization actually took place. For example, Baron counter-emphasized the civic involvement and the intellectual engagement in the governmental life that always accompanied those men that were first of all citizens of their epoch and members of political societies (Baron 1969). For others, the Renaissance self should not be taken as the voice of an expressive independent individual but rather as a contingent product of its time, which is always a result of social, economic, and political forces that shape and mold its identity. For, "fashioning oneself and being fashioned by cultural institutions – family, religion, state – were inseparably intertwined [...] indeed, the human subject itself began to seem remarkably unfree, the ideological product of the relations of power in a particular society... [being] not an epiphany of identity freely chosen but a cultural artefact" (Greenblatt 1980, p. 257).

Therefore, from an operational point of view, "the Renaissance self seems suddenly more complex than we might at first suspect. And yet, if we are to understand the Renaissance, we need to know... at least something of how Renaissance men and women viewed themselves; how they constructed, experienced, and understood their identities" (Martin 2004, p. 4).

However, the parabola of Renaissance homocentrism was descending since different issues contributed to its progressive decline. Among the motives for the de-centering of the self-referentiality, we shall certainly count the new

astronomical evidence and in particular the Copernican shift of the Earth (and its inhabitants) from the center of the universe, the unprecedented anatomical-comparative studies that questioned the exceptionality of the human body as such, the explorative intercontinental voyages and the discovery of other-than-Western civilizations, and last but not least the finding of new animal species, and of anthropomorphic primates in particular, that challenged the scholastic fracture in the "chain of being" between human rationality and morality and what was believed as mere animality (Baricalla 2000).

Nonetheless still today, as a Western tendency that in fact roots in the Renaissance and remerged strong during the Age of Enlightenment, "anthropocentrism, the belief that humans enjoy special, central, even cosmic significance, lives as present in everyday thought as an attitude toward other animals and the environment generally" (Butchvarov 2015, p. 1; cf. Guervich 1995).

Hooker, Richard

Born: March 1544, Heavitree

Dead: 3 November 1600, Bishopsbourne

Stefano Colavecchia

Dipartimento di Scienze Umani Sociali e della Formazione, Università degli Studi del Molise, Campobasso, Italy

Abstract

Richard Hooker was the most influential theologian of the late Elizabethan age. He was a student of theology from 1569 in Oxford, and his tutor was the influential Puritan and theologian, John Rainolds. From 1579 Hooker taught Hebrew and was later appointed Master of the Temple in London in 1585, where his sermons emerged as a vision of a religion that was far removed from any radicalism and inspired by the belief in a merciful God. While he was Master of the Temple, he had a long dispute with the Puritan Walter Travers, who accused him of excessive moderation. The most important works of Hooker were the eight books *Of the Lawes of Ecclesiastical Politie*, where the theologian defended the still young Anglican via media of the pressures of the Presbyterian Puritans and the counter-reformed Catholics. The *Lawes* reflect the theological disputes that Hooker had while at the Temple with Travers on soteriology and ecclesiology. In the eight books, Hooker decisively shaped the doctrinal, political, and official profile of Anglicanism: the theologian reaffirmed the principle of the *sola scriptura*, the legitimacy of the episcopate, and of the Anglican liturgical forms adopted in the Church of England. Above all, Richard Hooker argued vigorously in favor of the full legitimacy of the laws which were divided into revelation, reason, and tradition, and they also accounted for the insurmountable limit that the royal power could not exceed. His legacy was changing: from the traditional view of the theoretics of Anglicanism, Hooker's thoughts were interpreted in various ways, through

virtue of the multiplicity of the ideas and theories that pervaded his work so that no category could confirm and contain, once and for all, his thinking which was his major work.

Biography

Richard Hooker studied theology at Corpus Christi College in Oxford, where he was admitted in 1569 thanks to the patronage of John Jewel, and following the latter's death in 1571, of Edwin Sandys. Hooker's tutor was the cultured and influential Puritan theologian John Rainolds. After receiving his Bachelor of Arts degree in 1574, Hooker became a fellow of the College in 1579, and the same year, he was ordained a deacon, and, thanks to the support of Robert Dudley, he was appointed deputy professor of Hebrew. In 1585, following the recommendation of Sandys, he was appointed Master of the Temple at Church of the Inns Court. His sermons at the Temple did not focus on a deep theological analysis, but, moreover, they tended toward accentuating the interior dimension of faith, through which the soul is approached by a merciful God (Hooker 1612a). For this moderate view of religion, Hooker was attacked at length by the Puritan and preacher of the Temple, Walter Travers, who chided him for his excessive restraint when dealing with religious dissidents. In 1591, Hooker was appointed subdean of Salisbury and left the Temple, and began working on *Of the Lawes of Ecclesiastical Politie*, whose first four books saw the light in 1593, just as Parliament exuded its first action against the Puritans. The works were to be published in their entirety in separate posthumous phases: the fifth time in 1579, while the sixth and the eighth were only published in 1648, and the seventh in 1661.

The *Lawes* were conceived by Hooker as an impressive work in defense of the Elizabethan Settlement of 1559 (Collinson 1997). The theologian traced the profile of Anglicanism as midway between the extremes of the Catholic counter-reformation and puritanism (Shagan and Shuger 2016). The spectrum of ideas that inspired Hooker was very large, as well as the scope of his interventions, which included ecclesiology, *adiaphora*, and soteriology, and he even tackled the sensitive

issue of relations between temporal and spiritual power (Hooker 1993–1998). Hooker reaffirmed the principle of *sola scriptura* and defended the emphasis on episcopal authority in Anglicanism – and the hierarchical view of society that was implied – the liturgy was the defense of the principle of royal supremacy over the church. In the eighth book of the *Lawes*, which contrasted with the Puritans, Hooker outlined an inclusive profile of the church in which basically “church” and “commonwealth” coincided (Eppley 2008).

Hooker did not theologically justify the supremacy of the king over the church (Torrance Kirby 1990): this was legitimate as it had been established with the consent of the community and was limited by the laws of God, the kingdom, and the region. Underlying this conception did not involve the merger of church and state but was his peculiar conception of what was right (Lynch 2004). The theologian decided what was law, according to a hierarchy that reflected a Neoplatonic cosmology mold, at the top of which God sat (Torrance Kirby 2008). In this view, laws were divided into divine, natural, and “municipal” (McGrade 2004), a form of territorial law capable of limiting royal powers. Hooker was the only thinker of his time to put such an emphasis, not only on law but also on the “*Lawes whereby we live*” (Hooker 2013) and looked forward to a consensual idea of sovereignty. Hooker's masterpiece was also the first of its kind written in English to deal systematically with theology, politics, and legal philosophy (McGrade 2004).

The richness of the sources and the breadth of his thinking, combined with the delayed edition of the last three books of the *Lawes*, allowed Hooker's luck and interpretation to change. “Drowned in the torrents of Political and Religious confusion” (Brydon 2007), during the English Civil War, in the course of the eighteenth century, Hooker was attributed a smooth double identity, “as Whig and Tory” (McGrade 2004). Universally considered the most important defender of the *via media* (Atkinson 1997), if not the true inventor of Anglicanism (Lake 1988), Hooker was also deemed the precursor of English Enlightenment (Beiser 1996), while in light of manuscripts which resurfaced in recent years, he was confirmed a defender of the most reformed aspects of the Elizabethan church. However, the

depth and breadth of Hooker's thoughts meant that no reading matter was able to defend, so comprehensively, his belief in the doctrine of justification by faith in his most important piece of literature within such a rigid category (MacCulloch 2008).

Horace in the Renaissance

Born: 8 December 65 BC, Venusia (between Apulia and Lucania, in south-eastern Italy)

Died: 27 November 8 BC, Rome

Giacomo Comiati

Faculty of Medieval and Modern Languages,
University of Oxford, Oxford, UK

Abstract

The Latin poet Horace had a very important role in the early-modern culture. He was seen as a repository of philosophy (mainly ethics, morals, and poetics), a guide to virtuous behavior, as well as a literary authority in terms of style. His ethical and existential thinking as well as his pure literary style were among the elements of his works that appealed to his readership and largely affected, along with his *Art of Poetry*, Horace's legacy throughout the early modern period (and beyond). Accordingly, within the Renaissance period, Horace appears as one of the main protagonists of the

critical and literary scenes, as is shown by the attention that his works received from the point of view of editions, commentaries, and translations, respectively, as well as by the fact that his texts were placed at the center of several literary imitative practices, his example being able to offer the Renaissance one important basis upon which to found part of its new culture.

Alternate Names

Flaccus, Quintus Horatius

Biography and Works

Even though Horace was the son of a freedman, he was educated in Rome and Athens. During the civil war, he sided with Brutus, one of Caesar's murderers, enlisted in his militia, and took part in the battle of Philippi (42 BC) against Octavian and Antonius. After the defeat of the anti-Caesarean army, Horace returned to Italy thanks to a pardon from Octavian. In Rome, he found employment as a secretary in the state treasury and started to write his first Latin poems. Horace's compositions attracted the interest of many, among whom the poets Virgil and Varus, who introduced him to their patron Maecenas (presumably in 38 BC), who admitted Horace to his circle. Free from previous duties thanks to Maecenas's protection, Horace devoted himself to poetry and composed two books of *Satires* (also known as *Sermones*, published in 35 or 34 BC and in 30 BC, respectively), one of *Epodes* (c. 30 BC), his first three books of *Odes* (23 BC; also known as *Carmina*), and his first book of *Epistles* (20 or 19 BC). Horace's close relationship with Maecenas allowed him to become close to Octavian Augustus, who invited the poet to compose the *Carmen saeculare* (17 BC) and the fourth book of the *Odes* (published c. 13 BC), and to whom Horace dedicated his second book of *Epistles* (c. 11 BC). The last work that the poet wrote was the *Letter to the Pisones* (also known as *Ars Poetica*), presumably composed between 10 and 8 BC. Horace died

in 8 BC, a few months after his lifelong friend Maecenas. (For an overview of Horace's biography see Fraenkel 1957; Williams 1972; La Penna 1993; Lyne 1995; Nisbet 1996, 2007; Günther 2012.)

Horace's Philosophy

Philosophy plays an important role in Horace's life and literary production (Hommel 1950; Fraenkel 1957; Grimal 1958; Kytzler 1985; Michel 1997). Yet what the Latin poet is really interested in and values is largely (if not almost exclusively) the ethical dimension of philosophy (Michel 1997, p. 80; Casertano 1997, p. 96). Horace's ethics has two very specific characteristics. First, it is not an ethics *stricto sensu* (i.e., a set of systematic precepts), but it is rather conceived as a series of suggestions on everyday life that help the poet (and those who want to follow his advice) to lead a quiet and serene life (Deschamps 1997; Casertano 1997). Secondly, Horace's ethics cannot be strictly or exclusively connected to any philosophical school of the time, although there is a loose connection with Epicureanism. Indeed, some traits of the poet's philosophy (from his ideas on love to the theme of brevity of time; from the praise of countryside to that of a retired life) echo and derive from Epicurus's precepts (Diano 1961–1962; Büchner 1969; Grilli 1983; Deschamps 1983; Ferrarino 1986, pp. 344–54; Fraschini 1986; Erler 1994, pp. 372–73 and 379–80; Grilli 1997; Michel 1997; Mastandrea 1997), probably mediated by later Epicurean philosophers, such as Philodemus of Gadara, Phaedrus, Siro, and Diogenes of Tarsus, as well as Aristippus of Cyrene (Jones 1989, pp. 62–84; Traina 1991; Michel 1997; Kemp 2010; Armstrong 2004). Horace depicts the “summum bonum” (highest good) with Epicurean tone and form (since, according to the poet, it can be reached only by releasing oneself from the worldly necessities and the anguished quests for superfluous goods and needs – Mastandrea 1997). Nevertheless, Horace's Epicureanism can be defined as “eclectic” (Michel 1997, p. 79 – see also Mastandrea 1997, 88) since the poet does not

follow its principles in an orthodox way. Examples are Horace's idea of friendship, which is quite distant from that of Epicurus (see Grilli 1997) and his morality. In the latter case, Horace relies on inner liberty that either does not have a transcendental solution, or at least does not consider it as one of its essential constituents (La Penna 1993, p. 60). In this sense, Horace's stance is different from Epicurus, though rather close to the precepts of the Cynics. Equally importantly, Horace's Epicureanism was only one of the major classical philosophies (even if an important one), with which the poet was familiar, and from which he drew distinctive material in order to create his own lucid (albeit not consistent) set of ethical answers to address the specific issues that circumstances forced him to face (Battezzato 1997, p. 87).

In his works, Horace explicitly declared himself to be (and exhibited his satisfaction for being) equally far from all philosophical doctrines (see *Epist.* I, 1, 14 – Mastandrea 1997). It is now generally believed that Horace's self-representation as “Epicuri de grege porcum” (a plump hog of the herd of Epicurus – *Epist.* I, 4, 16) is only one of the many literary stances that the poet took in his texts in order to disorient and mock his readers (Deschamps 1997, 87; see also Traglia 1970, p. 41; Battezzato 1997, 84). In fact, in another poem he plays the Stoic (*Epist.* I, 1, 16–17) and, immediately after, the Cyrenaic hedonist (*Epist.* I, 1, 18). Indeed, Horace concretely kept his distance from every dogmatism and specific doctrine (Deschamps 1997; Mastandrea 1997). His philosophy was conceived as a practical and concrete “wisdom” that was put into effect as an art of living well without ever becoming an orthodox set of strict rules (Préaux 1968, p. 33; Casertano 1997; Deschamps 1997).

Horace's moral eclecticism can be seen as both a demonstration of the poet's erudition and a display of the typically Roman practical sense and keenness for liberty (a parallel can be traced with Cicero's similar attitude of never opting for a single philosophical school in his works) (Grimal 1982; Deschamps 1997, p. 87). In any case, Horace provides strong hints of his eclecticism. Indeed, he avowedly admires Socrates, whose philosophical attitude can be paralleled to

that used by Horace in his *Satires* (Deschamps 1997, p. 87). Moreover, in his *Ars Poetica* (line 310), the poet invites a reading of the “Socraticae [...] chartae” (the books inspired by Socrates, probably alluding to Plato's dialogues). But Horace's link with Platonism is not limited to this hint. Scholars have maintained that ode 1, 37 (the poem beginning with the famous line “Nunc est bibendum”), as well as the Roman odes (3, 1–6), the *Carmen Saeculare*, and many poems of the fourth book of *Carmina* have a strong patriotic and social commitment that can be linked to and probably derive from an elaboration of Platonic ideals (insisting upon Plato and the Academics on the importance of the philosopher's political commitment – Gantar 1972, 1997; Bond 1985). Horace seems to recall a Pythagorean concept (the “μηδὲν θαυμάζειν,” marvel at nothing) in his formula “nil admirari” (to be surprised by nothing – Lanternari 1981), even though this thought can be linked to Democritus's ἀθαμβία (imperturbability) and Epicurus's ataraxia (impassiveness/tranquillity) as well (Deschamps 1997, p. 87). The connections with the Stoics and the Cynics are more evident: on the one hand, the themes and practices of the latter are deep-rooted in Horace's *Satires* (Lebek 1981; Fischer 1983; Moreschini 1997; Deschamps 1997; Michel 1997, p. 80), as well as in the absence of (or, more likely, lack of interest in) a transcendental dimension within the poet's morality; on the other hand, Horace follows the Stoic precept of “naturalness” of life as the only criterion to distinguish truth from falsehood (Casertano 1997, 96), even though he warns against and opposes Stoic inflexibility (Mastandrea 1997; Michel 1997). Other links can, instead, be traced between Horace's philosophy and Aristotelianism (Bignone 1937; Brink 1963–1982; Wigodsky 1980; Zielinski 1986; Stabile 1997). Although he never mentions Aristotle or quotes his main works (e.g., the *Physics*, the *Metaphysics*, or the *Organon*), one can detect some elusive echoes of the *Nicomachean Ethics* and the *Poetics* in Horace's production (Coulter 1967; Pöschl 1968; Sbordone 1981; Stabile 1997, 95; Michel 1997). (Horace may have known the *Poetics* indirectly, through the interpretation of

Neoptolemus of Parium.) Finally, although there are superficial similarities between Aristotle's golden mean and Horace's "aurea mediocritas," scholars have pointed out that these two concepts are quite different, since Horace's "mediocritas" is a personal combination of Epicurean elements with others drawn from Panaetius of Rhodes, who, in turn, combined Stoicism with the Peripatetic school (Zielinski 1986, pp. 34–37; Grilli 1987, p. 15, 1997, p. 94; Michel 1997, p. 81).

Impact and Legacy

As pointed out in the previous section, ethical thought and considerations on human existence were central aspects of Horace's works. Accordingly, his reflections on life and his passages on moral behavior, vices, and virtues – often expressed in sentences of great elegance and sharp incisiveness – were among the elements of Horace's works that mainly appealed to his readers and largely affected, along with his *Art of Poetry*, the Latin poet's legacy.

While his whole production was appreciated and received in various ways by many authors of the Roman imperial period (e.g., Quintilian, Juvenal, Persius, Pliny the Elder, Gellius, up to Macrobius and Priscian – Tarrant 2007; see also Hooley 1997; Freudenburg 2001), including Christian poets, who admired and imitated Horace's lyrical texts (e.g., Prudentius, Paulinus of Nola, and Sidonius Apollinaris – Palmer 1989; Piscitelli 1998; Nazzaro 1998c, d; Most 2010, p. 455), the tendency to focus on Horace's moral and gnomic elements became quite evident during late antiquity, above all in works by Christian authors of the fifth and sixth centuries (e.g., Augustine, Jerome, and Boethius – Marin 1993; Nazzaro 1998a, b; Traina 1998). The Middle Ages inherited this tradition and mainly regarded Horace as a satirical chastiser of vices and a gnomic author, as well as a master of poetics (Villa 1984, 1992; Friis-Jensen 1997). Indeed, medieval Latin authors derived from Horace's hexametrical production (the *Satires* and the

Epistles), some material to include in the *Artes dictaminis*, *Artes poeticae*, and *Florilegia* of moral sentences (Quint 1988; Stella 1998; Sivo 1998; Alessio 1998; Lo Monaco 1998; Friis-Jensen 2007). Horace's lyrical texts received renewed attention only with the flourishing of humanism, thanks to Petrarch's sensitivity to them (Dotti 1994; Feo 1998): their existential depth and eloquent expressiveness sustained their *fortuna* throughout the early-modern period. Nonetheless, especially prominent was the legacy of the moral and gnomic Horace.

After Petrarch, early Italian humanists accorded Horace little attention (even though there were a few exceptions, e.g., Niccolò Niccoli, Vittorino da Feltre, Sicco Polenton, Angelo Decembrio, and Battista Guarino – Curcio 1913, pp. 48–50; Grendler 1989, pp. 203–04 and 253; Iurilli 2004, p. 31; Comiati 2019, pp. 96–105). After the early fifteenth century, however, humanist scholars began to devote lectures to Horace's works (see the lectures delivered by Antonio Brognanigo [Broianico] in Verona before 1468, by Antonio Calcillo in Rome during the academic year 1465–1466, and by Martino da Filetino [called Filetico] in Rome in 1470–1471 – Curcio 1913, p. 46; Altamura 1941, pp. 42–46; Gorni 1972; Friis-Jensen 1995; Ottaviani 1998; Pincelli 1998). At the same time, Horace's works were often printed in many Italian centers (see Horace's *princeps*, which appeared in Venice in 1471; the Milan 1474 edition of the poet's works, printed by Antonio Zarotto; Giovanni Alvise Toscani's Rome 1474–1475 edition; the Treviso 1481 edition, printed by Michele Manzolo; the Florence 1482 edition; Alessandro Minuziano's Milan 1486 edition – see Iurilli 2004, 2017). Horace grew so much in importance that, during the sixteenth century, he was completely integrated into (and was a central element of) school and university programs, both lay and religious (Grendler 2002, pp. 236–40). This revival was made possible by the development of a new pedagogical curriculum and thus by new critical attention paid to the Latin poet (Grendler 1989, pp. 133–41). The first significant turning point in this process was the 1482 commentary on Horace written by the Florentine Cristoforo Landino

(Curcio 1913, pp. 57–85; Weinberg 1961, I, pp. 71–81; Niutta 1993, pp. 21–23; Ludwig 1993; Iurilli 2004, pp. 32–34; Moss 1999; Bausi 1998; Nebes 2001; Pieper 2013; Stadeler 2015). This was the first thoroughgoing and insightful analysis of Horace's whole corpus, and Landino emphasized more eloquently than any before him the importance of the Latin poet as an authority to be studied for his wisdom and pure style. After Landino's work, the exegetical interest in Horace increased, and many other commentaries were produced (e.g., Antonio Mancinelli's 1492 exegesis of Horace's lyrical production; Badius Ascensius's commentaries on the hexametrical works [1499] and the whole Horatian corpus [1503]; Giovanni Britannico's comprehensive commentary on the *Epistles*, *Satires*, and *Art of Poetry* [1516] – Weinberg 1961, I, pp. 254–255; Baroncelli 1972; Coppini 1997; Ijsewijn 1998a; Gehl 2008a; Gehl 2008b). These major commentaries were soon printed together in single volumes, often along with the texts of the ancient scholiasts of Horace (i.e., Pseudo-Acro and Porphyry). Following the practice of multiple commentary editions, some editors decided to draw explanations devoted to Horace from the collections of annotations on Latin and Greek antiquity written by several humanists (e.g., Angelo Poliziano, Antonio Sabellico, Celio Rodigino, Giovan Battista Pio, and Pietro Crinito), and to gather them together in new exegetical volumes. This practice proved to be very effective in terms of editorial success and became quite common both throughout Italy (above all among Venetian printers) and abroad. The most complete multiple commentary edition ever published was that of Girolamo Scoto printed in Venice in 1544, which listed seventeen commentators (see Richardson 1994; Nuovo 1998; Maclean 2009; Iurilli 2004; Pettegree 2010; Taylor 2014).

From the 1550s, the main focus of the Italian exegetical attention shifted to Horace's *Ars Poetica* (Weinberg 1961; Grimaldi 1994; Cerasuolo 1995; Hardison and Golden 1995; Golden 2010). This text was not neglected before the mid-sixteenth century, as works by Aulo Giano Parrasio (1531) and Pomponio Gaurico (1531) that dealt uniquely with it testify

(Weinberg 1961, I, pp. 88–90; Tateo 1998; Iurilli 2004, pp. 47–48), but after the revival of the Aristotelian *Poetics* in the late 1530s the *Epistle to the Pisones* was put at the center of many interpretations (Javitch 1999; Schmitt 1983; Leroux 2019; Herrick 1946). In the fourth and fifth decades of the sixteenth century, the commentators, although continuing to analyze the Horatian *Ars* through the lens and categories of rhetoric, generally placed the two works in parallel, on the assumption that their content was the same (Weinberg 1961, I, 122–134; Grimaldi 1994, pp. 61–69; Iurilli 2004, pp. 54–56). Obviously, Horace's *Ars Poetica* (often combined with Aristotle's *Poetics* beginning in the late 1540s) was also used to further the Renaissance discussion about new literary genres and develop new theories about them (see, for instance, the considerations in Bernardino Daniello's *Della poetica* [1536], Julius Caesar Scaliger's *Poetices Libri Septem* [1561], Torquato Tasso's *Discorsi del poema eroico* [1587], and Philip Sidney's *Defence of Poesy* [1595] – Weinberg 1970–1974; Grafton 1983; Selmi 1994). During the last decades of the Cinquecento, the *Ars Poetica* was at the center of further deep and often critically acute investigation, as the works by Tomas Correa (1587), Nicolò Cologno (1587), and Antonio Riccoboni (1591) testify (Frischer 1995, 1996; Carlsmith 2013).

The second half of the sixteenth century saw the production of several exegetical works not only on the *Ars Poetica* but also dealing with the rest of Horace's production. Although some works were still written by Italian exegetes (e.g., Giovanni Paolo Cesario's 1566 commentary on the *Odes*; Gian Michele Bruto's 1566 and Bernardino Partenio's 1584 commentaries on the *Carmina* and *Epodes*; as well as the exegetical accounts of the whole Horatian corpus by Alessandro Piccolomini [1560s], Federico Ceruti [1585–1588], and Giovanni Fabrini [1566] – see Caccamo 1972; Refini 2009, 2011), the new most important philological editions and interpretations of Horace were composed by French and northern-European scholars (see the editions by Henri Etienne [1549], Georg Fabricius [1555], Marc-Antoine Muret [1555], Denys Lambin

[1561], and Jacob Cruquius [1578]; and the commentaries by Adrien Turnèbe [1577] and Ianus Dousa [1580 and 1582]). This trend continued into the following century as well (see the Horatian editions by John Bond [1606], Laevinus Torrentius [1608], and Tanneguy Lefèvre [1671]; and the commentaries by Heinsius [1610], Bond, Faber, and André Dacier [1681–1689] – see Niutta 1993; Rocca 1996; Iurilli 2004, 2017; and Grafton 1983, pp. 71–100).

A strong interest in Horatian works kept flourishing throughout the early modern period, as is testified by the various interpretations, exegeses, imitations (in both Latin and the numerous European vernaculars – Dauvois et al. 2019; Coppini et al. 2019), as well as references to and quotations of Horatian poems in contemporary philosophical works, such as Erasmus's *Adagia*, Montaigne's *Essais*, and Campanella's *Poesie filosofiche* (Schäfer 1970; Phillips 1970; McKinley 1981; Gray 1991; Zoppi 1994; Garavini 1998; Ijsewijn 1998c). Nevertheless, some elements of Horace's texts (namely, those passages that appeared too close to Epicureanism, as well as those related to titillating topics) puzzled Renaissance readers in various ways. The Renaissance inherited a long tradition of hostility towards Epicureanism (Kraye 2014; Palmer 2014), so interpreters attempted to justify, amend, or even remove these controversial sections. In his commentary to *Carmina*, Landino sometimes openly states that Horace was an Epicurean, even though – Landino hastens to say – he never regarded the soul as mortal (see his notes to *Carm.* I, 9 – Roberts 1995, p. 291); at other times Landino removes any Epicurean notion implicit in Horace's lines and connects them with a reassuring and orthodox biblical background (see his note to *Carm.* IV, 7, 16 “pulvis et umbra sumus” [we are dust and shadow]; indeed, he glosses “nam corpus in pulverem redit” [in fact the dead body turns into dust] and quotes Genesis 3:19). Mancinelli goes further in playing down the Epicurean overtones in Horace's poems. His strategies vary, from denying the proximity between Horace and Epicurean doctrine (see his note to *Carm.* I, 9 – Roberts 1995, p. 295), and ignoring certain passages (see his glosses to *Carm.* I, 4), to suggesting links with Stoicism (see his notes to

Carm. II, 3). Badius, instead, follows a completely different approach. Indeed, he chooses to highlight Epicurean passages in Horace's odes and demonstrate similarities between them and Christian doctrine. According to Badius, Christianity shares with Epicureanism a “scorn of procrastination” (De Witt 1954, p. 183) because of the ephemerality of human life (Roberts 1995, pp. 301–05), hence Badius glosses Horace's “carpe diem” formula (*Carm.* I, 11) by paralleling it with Christ's words in Matthew's Gospel (Matthew 25:13). Nevertheless, in some passages Badius explicitly condemns those Epicurean doctrines that are incompatible with Christianity (e.g., the demystification of the supernatural – see his notes to *Carm.* I, 16).

Although Badius's approach was quite ingenious, in the following decades of the sixteenth century other solutions had to be provided to deal with unorthodox passages of classical authors since the cultural and religious climate of the Counter-Reformation led Catholic writers to adopt more cautious solutions. Indeed, even before the Jesuits' *Horatius purgatus* (“purified” from every “obscenity”) appeared in Rome in 1569 – paving the way for many other censored editions of Horace's corpus (e.g., Bernardino de Llanos's *Poeticarum institutionum liber* [1605], Josse Desmaretz's *Horatius ad usum iuventutis accomodatus* [1648], Antoine Golleti's *Horatii puriores odae* [1676], and Joseph de Jouvancy's *Horatius purgatus* [1688]; see Grendler 1977, 1981; Hinz et al. 2004; Black 2013; see also Iurilli 2017) – some interpreters had already aligned themselves with the new cultural climate of increasing control over texts in the early post-Tridentine era. For instance, in his Italian translation of Horace's hexametrical corpus, Ludovico Dolce systematically replaced any passage of prurient subject-matter with highly prudish circumlocutions. He also censored the slightest allusion to any immoral situations (Borsetto 1990, 1994; Grimaldi 1994, pp. 53–88; and Borsetto 1996). It is interesting to note that, in the same years, in his commentary on Horace's works (1555), the Protestant philologist Georg Fabricius not only does not censor problematic passages but even takes them as a starting point for historical examinations (Schäfer 1976; Chiarini 1998).

The various and wide-ranging interests in both Horace, in general, and his ethical texts, in particular, find an echo in another use of the Latin poet that spread throughout the early modern period. It is a creative-imitative re-use of his poems combined with a tendency of receiving his works through an ideological lens. This re-use took two main forms: on the one hand, that of an ethical and gnomic parody of his texts in order to present Horace as a guide to moral and virtuous behavior (*Horatius ethicus*); on the other hand, a literary form of moral-confessional *travestissement*, a literary parody through which Horace is perceived and shown as the champion not only of probity and integrity, but also of an ethics that can be combined with Christian precepts (*Horatius Christianus*). Both forms can be associated with the still influential medieval tradition of assimilating the pagan gnomic with Christian “sapientia,” as well as the request for pedagogical use of Horace in early modern society and culture. The moral-confessional tendency is apparent in works such as Johannes Otho Maianus’s *Horatius Christianus* (1609), Jean Du Four’s *Horatius Christianus* (1629), and Jacques Ladore’s *Horatii Christiani Tripartitus* (1662) (Iurilli 2017). The *Horatius ethicus*, instead, finds expression in various other works: from lyrical books of rhymes (e.g., Pietro Massolo’s *Rime morali* [1583], in which the majority of the poems develop a moral theme drawn from Horace’s texts – Bruscagli 2007, p. 1597) to figurative enterprises (e.g., Otto van Veen’s *Emblemata Horatiana* [1607], in which one hundred and three Horatian moral precepts are paralleled with the same number of images representing them – Ludwig 2013), from scholastic textbooks (e.g., the *Horatii sapientia* [1626], a Dutch anthology of moral Horatian passages) to more traditional moral parodies (Stemplinger 1906; Beckenhaupy 1938; Schäfer 1998; Iurilli 2004, 2017). Although some sixteenth-century works already belong to this last category (e.g., Henri Estienne’s *Parodiae morales* [1575], Heinrich Meibom’s *Parodiae Horatianae* [1588–1589 and 1596], and Philipp Eysel’s *Periculum lyricum, seu parodiae aliquot Horatii natalitiis Christi accomodatae* [1600]), it is mainly during the seventeenth century that this genre reaches its peak. Examples are

Balthasar Exner’s *Ethopoeia Horatiana* (1601), Maciej Kazimierz Sarbiewski’s *Lyricorum libri IV* (1632), the anthology *Parodiarum ad Horatii Flacci Melpomenen centuria integra*, edited by Caspar Cunrad (1606), Johann Heermann’s *Parodiarum decas* (1609), David Hopp’s *Parodiae* (1634), Gian Battista Mascolo’s *Lyricorum sive Odarum libri XV* (1625–1626), Jacob Balde’s *Lyricorum libri IV. Epodon liber I* (1643), and Charles Bey’s *Odes d’Horace en vers burlesques* (1653) (see Schäfer 1976; Classen 1976; Valentin 1986; Thill 1993; Ijsewijn 1998b; Lefèvre 2002; Urbanski 2014).

Household Management

Alessandro Arienzo

Università degli Studi di Napoli “Federico II”,
Naples, Italy

Abstract

Household management (oeconomics) is the discipline aimed at the head of the family with the purpose of guiding him in the achievement of justice and “prudence” in the domestic sphere. As a doctrine of the *oikos*, it concerns the relations between the people living in a house and all the activities necessary for its management, preservation, and growth. It may also comprehend commercial activities, as these are limited and subordinate to the necessities of the house. From Xenophon and Aristotle to early modern literature of *res familiares*, the essential feature of household management is the capacity of the father to govern the house through the “just” (i.e., “rightful” and/or “most effective”) means. In different historical contexts, however, a number of other issues recurred and were variously discussed: the relation between the *oikos* and the *civitas*, the relation between morality and necessity, and the distinction between administration, government, and oeconomics.

Synonyms

Oeconomics

The Oikonomia

Household management (oeconomics) is the discipline aimed at the head of the family with the purpose of guiding him in the achievement of

justice and “prudence” in the domestic sphere. The Greek word *oikonomia* (οἰκονομία) is in fact composed of the two words *oikos* (household) and *nemein* (management and dispensation). As a doctrine of the *oikos*, it concerns the relations between the people living in a house and all the activities necessary to its management, preservation, and growth. It may also comprehend commercial activities, as these are limited and subordinate to the necessities of the house. In ancient philosophy, oeconomics is a part of ethics and is a form of practical knowledge (Leshem 2016). The most important classic sources for medieval and Renaissance literature on household management are Xenophon’s (c. 430–354 B.C.) *Oeconomicus*, Aristotle’s (c. 384–322 B.C.) first book of the *Politics* (as well as passages of the *Nicomachean Ethics*), and a set of texts for a long time attributed to the Stagyrite and commonly known as *Oeconomica* (Flüeler 1987).

The *Oeconomicus* in Xenophon and Aristotle

The *Oeconomicus* by Xenophon is a dialogue about household management and agriculture (Pomeroy 1994; Strauss 1970). The dialogue concerns the rightful relationship between a husband and wife, the rule of slaves and the government of the servants, the education of the children, the management of the house, and the art of farming. In the opening dialogue between Socrates and Critoboulus, the Greek philosopher equates the wealth of a property with the moderation of its governance and explains that the aim of oeconomics is the pursuit of the good life. Within this “moral framework,” how good household management is to be carried out is described by a gentleman farmer named Ischomachus. He represents the “perfect gentlemen” endowed with all the necessary knowledge to accomplish a good and successful life to keep the *oikos* rich and to provide money for the public sphere. Xenophon’s *Oeconomicus* was first translated by Cicero (c. 79–51 B.C.) into Latin, and through this translation, it gained wide popularity during the Middle Ages and the Renaissance.

A second very important source for medieval and Renaissance household management is Aristotle’s *Politics* (Aristotle 2009). In his treatise, the Stagyrite defines the city as an ensemble of families and, before examining how a city should be governed, he describes the good management of the *oikos*. The first book is thus dedicated to oeconomics with the double aim of explaining why the rule of the father is different from that of the magistrate and setting the moral limits for the enlargement and enrichment of the property. In fact, Aristotle’s oeconomics is, above all, based on practical wisdom (*phrónesis*) guided by rational rules (*téchne*) and the expression of an individual disposition (*héxis*). It can be divided into four parts concerning husband/wife relations, the education of the children, the rule of the servants, and the acquisition of the riches necessary for living well. This last part is termed chrematistics (from *chrēmata*, “riches, goods”) and only partially coincides with oeconomics. In fact, differently from Xenophon, for whom there are no limits to the acquisition of wealth, according to Aristotle the unlimited procurement of riches is both morally reprehensible and “unnatural” (i.e., not finalized to natural living). In this sense, while a “natural” chrematistics is a subordinate part of the oeconomics, both must be distinguished from an unnatural chrematistics, which represents an unlimited striving after wealth and riches.

It is known that Aristotle also wrote a treatise on oeconomics of which we only have two fragments left. In the first of these fragments, he discussed the relations between husband/wife, father/children, lord/servants, and revenues/outflows. In the second, he dealt with what servants owe their masters.

Oeconomica in the Hellenistic Age

A third influential tract is the pseudo-Aristotelian *Oeconomica*, (Pseudo-Aristotle 1986, 2013; Valente 2011) until recently attributed to Aristotle but probably authored instead by Theophrastus (371–287 B.C.). The first two books are dedicated to exploring the meaning of oeconomics and its many different aspects. Oeconomics must be differentiated from politics as the two differ according to

the number of subjects and rulers involved. The treatise deals at great length with agriculture, which is deemed the most important use of a property, and with the care of the people of the family. The three central features of good household management are deemed to be the duties of the wife in the governance of the estate, the duties *of* and *toward* the slaves, and the knowledge necessary to acquire goods and riches and guard the properties and trade. While book one introduces the basics of any economy (expenditures should never exceed income), book two describes four different types of economies and their own rules. These are the Royal Economy, the Satrapic Economy, the Political Economy, and the Personal Economy. In the second book, the term “oeconomics” is therefore also used to indicate the organized management of wealth in a *polis* (II.1, 1346 a6). The third book, the only one probably by Aristotle, deals with the relationship between a husband and his wife (Laurenti 1968).

Besides the *Oeconomica*, a number of other Hellenistic texts played a significant role in the recovery of household management literature in later ages: among them, the *Oeconomicus* by Filodemo di Gadara (110–35 B.C.), the *Oeconomica* by the neo-Pythagoreans Callicratidas (451–406 B.C., Philodemus 2012) and Brisone (450–390 B.C., Callicratidas 2012), the *Oeconomicus* by Dio Chrysostom (40–120), and the *Oeconomicus* by Hierocles (second century AD ca., Hierocles 1987). In these treatises, oeconomics is variously described as (1) the management of the *oikos* reserved to the wife as distinguished from the management of the public sphere attributed to a man, (2) the rule of property by the householder, and (3) the management of goods and properties by the philosopher. However, the term oeconomics is also used to denote every field in which the capacities of good management can be applied.

Oeconomicus in the Middle Ages and the Renaissance

During the Middle Ages, there is no clear-cut definition of oeconomics, but a wide and complex adaptation of this literature to the principles of

Christianity and to feudal society (Lambertini 1985; Todeschini 1977). Relying on Peripatetic sources, Boethius (480 ca.–526) draws a distinction between ethics, politics, and oeconomics, all of which are moral disciplines (Boethius 2000). Ethics is *cura sui* (self-care) and is aimed at the acquisition of virtue, politics is the care of *res publica*, while oeconomics concerns *res familiaris*. A significant reflection on household management is also *De cura rei familiaris*, a letter long attributed to Bernard of Clairvaux (1090–1153) (Bernard of Clairvaux 2012). The text is a collection of maxims and quotations in which household management is deemed as a necessary worldly affliction from which the virtuous man should remain spiritually detached (Bernard of Clairvaux 1998). The most important treatise on household management is, however, the *Speculum doctrinale* by Vincent of Beauvais (1190–1264) in which writings by various sources, among them Cicero, Theophrastus, and Augustine (354–430), are merged to compose a broader “cento.” In this treatise, Vincent tries to overcome the separation between household management as the art of governing the persons and oeconomics as the art of acquiring, preserving, and administrating the wealth and riches of the family.

A significant change in the literature on household management occurred starting in the thirteenth century through the Latin translations of Aristotle’s *Politics* and *Nicomachean Ethics* and of the pseudo-Aristotelian *Oeconomica* (Jackson 2010). Among them, the most significant contributions were by Robert Grosseteste (1175–1253), Durand d’Auvergne (1295–1329), and William of Moerbeke (1215–c. 1286). The most influential lesson (reprised from Eustratius of Nicaea) was that of Thomas Aquinas (1224–1274) who emphasizes ethics, oeconomics, and politics as separate spheres, leading from the individual to the political unit via the family. Another significant work is the *Summa grammatica* of Johannes de Dacia (late thirteenth century circa, Dacus 1955), in which *politica*, *yconomica*, and *monastica* are discussed separately, and *yconomia* is presented as a *scientia dispensandi et regendi propriam familiam* (knowledge of dispensing and

controlling one's own family). Dacus explicitly holds that the correct distinction between politics and oeconomics is not to be found in Cicero's *De Officiis* (Cicero 2001), but in Aristotle's *Politics*.

Within this tradition, one of the most influential treatises on *oeconomica* and politics is *De regimine principis* by Giles of Rome (1246–1316), whose second part is dedicated to household management (Colonna 1502; Briggs 1999). The art of governing the *oikos* is described by the philosopher as a crucial part of a broader *scientia civilis* for the observation of the natural character of the *oikos* is used to justify the expansion of the principles on household management from the relatively narrow space of the court to the whole political community. The continuity between the governing of the self, through the governance of the *oikos*, to the government of the *civitas* or the *regnum* allows Giles to discuss in great detail the *regimen coniugale*, which he equates to his conception of *regimen politicum*, the education of children (resembling his *regimen regale*), and the rule over servants (analogous to his *regimen dispoticum*). Other relevant themes are the management and enlargement of wealth and possessions; Giles therefore renews Aristotle's distinction between oeconomics and chrematistics.

The philosophical and political approach to household management underlined by Giles rests on the idea of continuity between the governance of the house and the administration of the *civitas*. However, an alternative reading emphasized instead the separation between politics and the art of governing the *oikos*. A number of other authors principally commented and reflected upon pseudo-Aristotelian *Oeconomica* and concentrated their attention on the administration of the house (the wife, the children, and the servants) in order to develop a specific art of oeconomics. The most important commentary was that by Nicole Oresme (1325 ca. –1382) in which the art of household management is presented within the framework of Holy Scripture. An important tract was also that by Leon Battista Alberti (1404–1472), whose *I libri della famiglia* (1433–1440, Paoli 2013) circulated in manuscript form (the work was first printed in the nineteenth

century). Alberti sharply separated the *oikos* and the republic, focusing on household management as the art of taking care of the family as well as the art of managing its riches and goods (*masserizzie*). Oeconomics is fundamentally the art of preserving the peace and wealth of the family from the adverse fortunes of life and commerce. It is important to note that, while Alberti's oeconomics was principally based on Aristotelian themes, it also presented themes that echoed the different literature dedicated to *mercatura* (the art of trade and commerce, Maifreda 2012).

Within the vast production of treatises prompted by the new humanist translations and the reinterpretation of Aristotle and Xenophon – suffice it to mention Leonardo Bruni's translations (Soudek 1976) – the literature on household management expressed a new set of principles and themes, sometimes connected with a new courtier and princely culture (Frigo 1985; Mozzarelli 1988; Kraye 2008). Representative of this new sensibility toward oeconomics is Paolo Caggio's (1520 ca.–?) *Iconomica* (1552), a work in which the governance of the *oikos* is distinguished from the ruling of a principality or of a republic, but, at the same time, the administration of a polity is deemed to be achieved through the same courtesy and attention that should characterize the governing of a household (Caggio 1552).

Later tracts revive the classical conception of household management as a form of practical wisdom, and a number of texts variously discuss oeconomics within the framework offered by the category of "prudence." As an example, in his *Reggimento del padre di famiglia* (1580), Francesco Tommasi (c.1540–?) offers a critical synthesis of classical and medieval tradition on oeconomics derived from Aristotle, Xenophon, and Saint Thomas (Tommasi 1580). Another relevant treatise is *Della economica. Overo disciplina domestica* (Assandri 1616) by Giovanni Battista Assandri, an Italian writer of the early seventeenth century, in which oeconomics is described as "Prudence to make and keep the household happy" (Frigo 1992, 63). Assandri dwells at length on the practical nature of *oeconomica*, addressed to an investigation of things that are "contingent" and linked to

man's active life. The art of managing a household is therefore described as a domestic form of prudence. In the very same way, a few years later, Bartolomeo Frigerio in his *Economus prudente* (1629) defines oeconomics as "a certain prudence with which one governs a family well" (Frigerio 1629; Frigo 1992: 64). A partly different approach is that of Tommaso Campanella (1568–1639) who, in the fourth part of his *Philosophia realis* (*De oeconomica* 1623), described the father of the household as a wise administrator and agriculture as a moral activity, since it implies the nurturing and the care of the land being depicted as the "ancient mother." In his *Oeconomica* (Campanella 1623), a significant place is also given to the dignity of labor and to a critique of false nobility and of usury (Ernst 2010).

In the second half of the seventeenth century, the doctrine of household management becomes an autonomous literary genre, not merely addressed to the prince and the court, but to a wider audience: members of the city's aristocracy, landowners, merchants, and members of the clergy. While representing a society divided into different social ranks, for each of these ranks, this literary genre defined the specific rules for private and public behavior. All these writings thus shared "the vision of domestic and 'private' space as an indispensable segment of the civil order" (Frigo 1992: 64).

Within the images of the *oikos* projected by the long-lasting history of oeconomics, two different sets of problems seem to converge, besides that of delimitating the space of the household. The first is related to a doctrine of the authority that is usually implied in governing the *oikos* ("who" has the authority to govern). The second concerns the different ideas on the management and administration of people and goods (how the *oikos* should be governed). The historian Otto Brunner (1950) was the first scholar to focus on how, throughout its history from ancient Greece to modern times, household management has always been characterized by a "seigniorial moment": i.e., the necessity for the householder to rule his domain effectively and with efficacy (see also: Krüger 1964). From Xenophon and Aristotle to early modern literature of *res familiares*, the

essential feature of household management is a father's capacity to govern the household through "just" (i.e., "rightful" and/or "most effective") means. In different historical contexts, however, various other issues recurred and were variously discussed: the relation between *oikos* and *civitas*, the relation between morality and necessity, and the distinction between administration, government, and oeconomics. Throughout its history, oeconomics has always moved between the management of the *oikos* and the governance of the *res publica* and between the moral guidance of the people and the effective management of men, riches, and wealth.

Human Dignity in Renaissance Philosophy

Lyndan Warner

Saint Mary's University, Halifax, NS, Canada

Abstract

The "dignity of man" concerns the human condition and what sets humans apart from other creatures on earth and in the heavens. The idea had origins in ancient Greek and Roman literature and later added the biblical story of creation

from the Old Testament, which became central to the concept in the Renaissance. A number of literary motifs characterize the “dignity of man” such as the idea that man is a microcosm of the universe, the praise of the human body and its parts including the erect posture of humans with the face looking towards the heavens, and the lists of accomplishments or feats of exemplary men and women. The free will or choice that humans have to “shape” or “determine” their nature becomes the most important aspect of the Renaissance dignity of man and woman for humanists in the 1500s and for later generations of scholars, especially after the 1800s.

Synonyms

[Dignity of man and woman](#); [Dignity of the human being](#)

Heritage and Rupture with Tradition

The idea of human dignity has become associated with the Renaissance through the *Oration on the Dignity of Man* of Giovanni Pico della Mirandola (b. 1463–d. 1494), probably the most famous speech that was never actually delivered before an audience. Written to introduce a public debate, but abandoned and only published after the author’s death, this “most elegant oration” acquired the subtitle *de hominis dignitate* (on human dignity) in a 1504 Strasbourg edition of Pico’s works. (Pico della Mirandola 2012, 8, 33). Pico was not the first Renaissance thinker to consider human dignity, nor the last, but his *Oration* has come to represent a turning point for its Renaissance optimism in human potential.

The tradition of the “dignity of man” stemmed from Greek and Roman origins in classical pagan sources such as Plato (c. 425–347 BC), Aristotle (b. 384–322 BC) in the *De anima* (*On the Soul*) (Aristotle 1907, II, 2–3: 413a–414b) pondering the qualities of each state of being within the world and Cicero (106–43 BC) who emphasized the immortality of the soul. In late antiquity after the spread of Christianity both Greek and Latin

Church fathers such as Gregory of Nyssa (335–c. 395) and Lactantius (240–320) integrated these classical writings on the relationship between the earth and its creatures, humans, the soul, and the universe into their Christian works. In the medieval era human “dignity” stemmed from the creation of man in God’s image and likeness, a notion that circulated in Latin commentaries in the ninth century, the 1200s to 1300s, and was later translated into English in the 1400s. (Lebech and McEvoy 2009, 4–6, 31–2). Human dignity as a theme resurfaced in the writings of Italian humanists such as Bartolomeo Fazio’s *De excellentia ac praestantia hominis* (*On the Excellence and Superiority of Man*) (1448), Giannozzo Manetti *De dignitate et excellentia hominis* (*On the Dignity and Excellence of Man*) (c. 1452), and Marsilio Ficino (1433–1499) in his *Platonic Theology* (c. 1474) Ficino (2001–2006). In the fifteenth-century formulations of the “dignity of man,” humans occupied a fixed place in the hierarchy of beings in the universe with God and angels above and the animals, fish, plants, and stones below. Humans were connected to the material world through the body and the spiritual world of the heavens through the soul and their unique situation at the center of the hierarchy of God’s creation conferred dignity.

In Pico’s late fifteenth-century *Oration*, the Creator speaks to Adam in the Garden of Eden to explain the place of humans in the greater world. The Creator explains to Adam that creatures on land in the sea and air were assigned a fixed nature, whereas humans, in God’s words, “were neither of heaven nor of earth, neither mortal nor immortal” and could “shape” or “determine” their “form” (Pico della Mirandola 2012, 117; Pico Project). It is this choice – because humans are “constrained by no limits” – that caught the imagination of the nineteenth- and twentieth-century scholars who considered the oration as “one of the noblest bequests” of the Renaissance (Burckhardt 1958, 351–2).

Emerging in the mid- to late-1400s and continuing throughout the 1500s was a parallel literature on the dignity of woman, which argued the case for the excellence of the feminine sex and demonstrated how men and women shaped

human dignity. In Renaissance versions of the “dignity of man” and “dignity of woman” traditions, the creation story offered a number of shared literary motifs and interpretations of man and woman’s place in the world and the heavens beyond. Commonplaces recur in dignity of man and woman literature such as the erect posture of humans looking up towards the heavens, the praise of the human body and all its parts, the idea of man as a microcosm or “little world,” and the examples of the achievements of the illustrious men and women of history compiled from biblical, classical, and contemporary accounts (Warner 2011, 51–70).

In its Greek origins the idea of the *mikros kosmos*, *microcosm* or “little world” meant that humans comprised all the elements in the universe. Eugene Rice stresses the impact of the Greek patristic fathers Gregory of Nyssa, Nemesius of Emesa (late fourth century), and Origen (c. 185–c. 254) who encouraged this classical theme of man as a microcosm and added a Christian veneer that man connected the “physical and intellectual worlds.” Acting as a link or *vinculum mundi* between the heavenly world or macrocosm and the earthly world granted further dignity to humans (Rice 1988, 24; Kraye 1988, 311–12). By the Renaissance, writers supporting human dignity combined the microcosm motif with the biblical creation story. In *The Week or Creation of the World* first published in 1578, Guillaume de Saluste Du Bartas (1544–1590) remarks: “Within us can be seen fire, air, earth and the waves of the sea / In brief, man is nothing but an abridgement of the world” (Du Bartas 1578, 178). The Lyonnais humanist, Maurice Scève (c. 1501–c. 1560), entitled his 1562 poem on the creation of Adam and Eve, the *Microcosm*. This dignity extended to and included woman because as “the last one created of all other creatures” woman was “the final and most perfect accomplishment of all of God’s works and the perfection of the universe” and she “contains all the world” (Lefranc 1530, lxxix^v, xciii^f; Agrippa 1535, B v^v).

The creation story of Adam and Eve allowed an author to exalt human dignity and praise God’s

work by dwelling on the perfection of each human body part. In the *Brief Discourse of the Excellence and Dignity of Man*, published in Paris in 1558, Pierre Boaistuau glorifies the body with “Praise of the excellence of the eyes,” eyebrows, nose, tongue, teeth, beard, ears, and so on. (Boaistuau 1982, 51), but he borrowed these commonplaces from a sixteenth-century French translation of the Church father Lactantius’s *Divine Institutes*, dating to the early fourth century.

To mark the superiority of humans over other creatures, the upright posture praised by Renaissance writers such as Boaistuau, Scève, Du Bartas can be traced as a literary motif as far back as the *Metamorphoses* of Ovid (43 BC–17/18 AD) the Latin poet of the reign of Augustus at the beginning of the Roman empire:

Whereas other animals hang their heads and look at
the ground,
he made man stand erect,
bidding him to look up to heaven,
and lift his head to the stars. (Ovid 1986, I, 84–6).

The erect posture allowed contemplation of the heavens and also established humans as rulers over God’s creatures on earth (Patrides 1982, 85, n. 5, 6; Kraye 1988, 311, n. 55; Sozzi 1970, 186–7, Sozzi 1982). Adam walking “with his head held high” like the “Lord” instilled amazement and fear in the “humble” animals as he became “their master here on earth” (Scève 1976, 151). Dignity stems from this role as a “terrestrial Emperor,” a “second God” or “Lord of this lower world” (Du Bartas 1578, 180–81). This motif emphasizes the idea that God created the world as a dominion available for human exploitation in each of its domains. Man becomes the “sovereign admiral” of the sea or the “great captain” and “great chief general” of the earth and air (Parmentier 1971, 99–100). Again, some writers promoted the dignity of woman with the parallel motif of God introducing Eve as the “the queen of a kingdom already prepared for her,” with “every creature (to) submit to and obey her” (Agrippa 1996, 48).

Another commonplace of the dignity of man and dignity of woman traditions traces the lives of exemplary men and women who achieved

greatness or excellence. Writing in Latin in the mid-fifteenth century, Giannozzo Manetti (b. 1396–d. 1459) was typical of humanists in compiling biographies of the accomplished men of antiquity such as Seneca or Socrates as well as praising the men of his own era such as the Chancellor of Florence Coluccio Salutati in *On Famous Men of Great Age*, 1439 and his later writing on human dignity (Manetti 2003, 2018). Well into the sixteenth century, Renaissance writers continued this tradition to praise the achievements of Alexander the Great, Lysurgus the Spartan lawgiver, Julius and Augustus Caesar, David and Solomon who “by their virtue attained honor and triumph” (Champier 1502, xxv^v). Scholars celebrated the new inventions that demonstrated “the dignity and wit of man” such as the printing press and Leonardo da Vinci’s invention of flying (Boaistuau 1982, 55–62, 65). Similarly, Renaissance writers drew upon the women in the Scriptures such as Judith, or the female exempla in the histories of ancient Greece and Rome such as Aspasia, Lucretia, or Cornelia, and fifteenth- and sixteenth-century learned or royal women such as Christine de Pisan and Marguerite de Navarre to demonstrate the excellence of women in different fields of endeavor (Berriot-Salvadore 1990, 355; Helisenne de Crenne 1986, 100–101; Agrippa 1996, 79–89; Warner 2011, 74–83).

Innovative and Original Aspects

In the mid-fifteenth century, Manetti’s *On the Dignity and Excellence of Man* reflected a common belief that each creature or being possessed specific talents as gifts granted by God: “our human fruits are to be deemed the many operations of intelligence and will. It is these to which man is born by nature just as the tree is born to produce fruit” (Manetti 1966, 92–3). For Manetti or Ficino humans occupied a place of dignity through their place at the center of the hierarchy of creation whereas for Pico della Mirandola and later Renaissance thinkers, such as the French humanist Charles de Bovelles (b. 1479–d. 1553)

or the German humanist Henricus Cornelius Agrippa von Nettesheim (b. 1486–d. 1535), dignity was a potential within humans to be aimed for and earned through force of will.

In Pico’s notion of the human as spoken by the Creator to His creation, this free will is precisely what distinguishes the human from the other creatures. Each human, like Adam, faced a choice “to degenerate into the lower forms of life, which are brutish” or to ascend using the “power, in accordance with the judgment of your soul, to be reborn into the higher orders, those that are divine” (Pico della Mirandola 2012, 117; Pico Project).

Charles de Bovelles’ *De Sapientia (Of Wisdom)*, published in Paris in 1511, explains how Nature provides every human (*homines*) with the capacity to exist, live, feel, and understand or reason (*substantia, vita, sensus, ratio*), but some humans never achieve their potential and remain at a lower level of being (Bovelles 1982). In this understanding of the human condition – a development on the thinking of Aristotle, Ramon Lull, Cusa – humans encompass all the lesser states of being – mineral, vegetable, animal but need to apply their reason and intelligence to attain the states of being shared with the divine, the angels, the heavens (Bovelles 1982, 57, 160–61, 165; Ferrari 2011, 262–3, 287, 323). Bovelles, like Pico della Mirandola, adopted the idea of striving for human dignity – that dignity was the potential of humans and equal to all, but not achieved by all (Magnard, 1995).

Similarly, the German humanist Agrippa acknowledges that human accomplishment occurs “according to our capacity” or *secundum capacitatem* (Agrippa 1992, 520; Agrippa 1982, III: 142–3). For Agrippa a wise man seizes his dignity to attain great power and virtue – “*et ipsa est dignificatio homini ad hanc tam sublimem virtutem ac potestatem*” ([“and it is the dignity of man for this so high virtue and authority”]) Agrippa 1992, 407; Agrippa 1982, III: 24–5). This accent on the capacity of the soul resurfaces in Agrippa’s discussion of woman. He emphasizes that the soul – not the body – mirrors the image of God. He insists that man and woman

share the divine spiritual image and asserts that women share the same potential as men. The Lord “gave to woman as to man the same form of soul, utterly without difference. Between these souls could not be found any difference of sex. Woman received equal (capacities of) understanding, reason, speech and language as man.” Agrippa concludes “in both (sexes) is a same liberty of judgment and will and equal dignity” (Agrippa 1535, B^r; Warner 2011, 77).

Impact and Legacy

One of the values we hold as most fundamental in modern life is the dignity of the human condition. The preamble to the 1948 Universal Declaration of Human Rights refers to the “inherent dignity” of all humans; its first article states that “[a]ll human beings are born free and equal in dignity and rights.” Dignity as shared by all humans equally, in this twentieth-century definition then, is closer to fifteenth-century Renaissance formulations of inherent dignity because the formulation carries an assumption that “no other species is equal to humanity” in the way that early Renaissance humans drew dignity from their place at the center of the world as beings encompassing all aspects of the universe (Kateb 2011, 6; Niederberger 2015, 513–14).

Over the course of the Renaissance writers such as Pico, Bovelles, or Agrippa outlined how dignity was a quality to be achieved – to be acquired through striving for excellence – a value that perhaps is most evident in a humanist education. Pico’s *Oration* has more resonance with current ideas about the “choice” or “liberty” to act and to “make,” “fashion,” or “determine” one’s self.

Human Senses in Renaissance Science

Gisela Coronado Schwindt

Research and Medieval Studies Group, Center for Historical Studies, Faculty of Humanities, National University of Mar del Plata, Mar del Plata, Argentina

Abstract

Philosophical discussions about senses and perception processes characterized scientific debates during the Renaissance. The inquiry into the nature of the senses in the generation of knowledge, influenced by anthropocentrism that placed the spotlight on human reason, was framed between two positions bequeathed by classical antiquity and reworked during the Middle Ages (Newhauser 2014, 107–126): platonic conception of the hierarchy of the senses and the Aristotelian. During the Renaissance, these positions were criticized in light of the new corpuscular philosophy that aspired to replace the dominant Aristotelian theory of real sensory qualities and sensitive species. In addition, the construction of a metaphysical hierarchy of perceptions began to be developed, in which the vision took a leading place, as well as the way of conceiving the body and its functioning, which gave way to a positive assessment of other senses, such as touch. At the same time, a question began to be about the reliability of the information conveyed by the senses as the sixteenth and seventeenth centuries advanced.

Heritage and Rupture with the Tradition

Human beings connect with the world, apprehend it and experienced it from their first moments of life through the five senses (Le Breton 2006). That way Sir John Davies explains it in his philosophic poem *Nosce Teipsum*: “By touch, the first pure qualities we learn, / Which quicken all things, hot,

cold, moist and dry;/ By touch, hard, soft, rough, smooth, we do discern;/ By touch, sweet pleasure and sharp pain we try." (Davies 1599, XVI, 45–46). Different cultures, throughout history, have reflected on how to perceive the world and the number of senses used. Attention paid to sensorial issues was of significance in western thought because it was not only a particular topic but it was also a complement to other possible objects of study related to the conduct of man in society. This made it possible to place the *sensation* in a relevant spot in the history of ideas (Newhauser 2010, 6). During the Renaissance, there was a new interest in the perceptual process as a result of a change in the conception of man and the world. Indeed, from the prevailing medieval theocentric mentality, it moved to anthropocentrism, which placed the individual at the center of natural and philosophical exploration. Philosophical inquiry oscillated between the platonic tradition, which considered imperative to exclude the perception of the realm of ideas, and the Aristotelian one, which affirmed that the sensation was directly related to the thought (Aristotle 2007, II, 6–12).

Different ways of perception, and their transmission channels, led various thinkers, from Antiquity to the present day, to question the nature of senses, their role in the generation of knowledge, and their reliability in this creation. This questioning of the sensory issue in the philosophical thought of the Renaissance was synthesized in two movements. On the one hand, the main cognitive faculties (sense, memory, imagination, and comprehension or intellect) were at the centre of the discussion on epistemology and metaphysics (Hatfield 2008, 953). In this context, the theory of the senses became relevant in the discussion, since the new corpuscularian philosophy was intended to replace the dominant Aristotelian theory of real sensorial qualities and sensitive species. On the other hand, the construction of a metaphysical hierarchy of the senses, in which the vision occupied a predominant place, became important (Kambaskovic and Wolfe 2014, 107). However, during these centuries, other sensorial perceptions

participated in the way to conceive the body and its functioning, such as touch.

The conception and classification of the senses have their origins in classical Antiquity. Plato and Aristotle were the ones who established the hierarchy of the senses (Jütte 2005, 61–70, Clements 2014, 115–138) that crystallized in the successive millennia. This development was based on the systematization of the faculties or cognitive powers and their distinction between external and internal senses. The externals were made up of vision, hearing, smell, taste, and touch, while the internal ones were made up of memory, imagination, common sense, and reflection. Among these, imagination played an important role for two reasons. Firstly, because it received the images of the senses and, secondly, because with this information it originated a representation of the object. In the same way, common sense recognized and compared the discernment of the external senses: for example, it discriminated between blue color and sweet taste.

In the sixteenth and seventeenth centuries, this philosophical disintegration of cognitive faculties and senses was framed in two predominant lines of thought: platonic and Aristotelian. The two traditions differed mainly in the ontology of the sense, the intellect, and the role that these faculties played in the acquisition of knowledge (Hatfield 2008, 954). For Renaissance platonic authors, the intellect could operate independently with respect to the senses, contemplating intelligible objects that were not available to them, such as God, the soul, or intangible forms. Instead, Aristotelian denied that the soul was a separate substance from the body and that it acted independently of the sensory perceptions. On the contrary, for them, all knowledge arose through the senses, including the understanding of both nature and God. All these discussions about the intervention of the sensorial experience in the process of knowledge led to the questioning of other philosophical and scientific aspects that made a particular imprint on the Renaissance and early modern period (Roodenburg 2014).

Innovative and Original Aspects

The sensory world of the Renaissance was crossed by the traditional practices and beliefs of the ancient and medieval times and, at the same time, by the sensory values that were beginning to be transfigured at the gates of the modern era (Classen 2001, 358). Sensorial elements (sounds, smells, and colors) were estimated as true transforming agents: from health or disease mediators to carriers of planetary energy, became symbols of the social order (Classen 1993). This change took place in line with other mutations in the social and cultural sphere, such as the rise of individualism as a social structure, the emergence of positive and secular rational thinking about nature and birth of a new conception of the body by distinguishing it from the human person. Andreas Vesalius (1514–1564) and Leonardo da Vinci (1452–1519) were the exponents of this transformation in which the body became the ancillary form of man, able to be examined from a mechanistic perspective (Le Breton 2000, 29–80).

In this context, the sense of sight was the most esteemed within the western sensory hierarchy because its participation in the perception process was performed remotely from the object to be perceived, so it did not involve body experimentation. During the Renaissance, this sense reaffirmed its supremacy not only by perceiving from a distance, but also because of the need for light, becoming the central element of the theorization of optics (Kepler 1968 [1604]) and perspective (Kambaskovic and Wolfe, 2014, 111–112). In general terms, these theories held that objects emitted similarities or replicas of themselves (*species*) that then moved to the brain through the eyes and optic nerves. In this process, the mind had direct access to the precise images of the world. However, in the sixteenth and seventeenth centuries, the vision began to arouse uncertainty and unreliability (Clark 2007, 2). Indeed, the legacy of the Renaissance was to introduce doubts about the process of perception and cognition (Pender 2014, 132), still in

the sense of sight, considered, up to that point, as the noblest.

Perceptions began to be revalued by their implications for medical issues, leading to broader philosophical reflection. Renaissance philosophers and doctors devoted great efforts to reading the signs of the living body in its material and spiritual element (Pender 2014, 130). In consequence, they endeavored to know the structure, function, and use of the senses in pursuit of a holistic understanding of their functioning. In this process, touch began to be the subject of observation and subsequent theorization. For the English philosopher and physician John Bulwer (1606–1656), the hand was the spokesman of the body, while touch became the universal language of humanity since their expressions could be understood by any human being (Bulwer 1649). In this way, the hands encouraged a dialectical experimentation since it was impossible to touch without being touched.

William Harvey (1578–1657) and Franciscus Sylvius (1614–1672) also highlighted this distinction of contact in medical knowledge. In both cases, the ability of touch was complemented by the view, granting a superior authority to the tactile in the medical examination over demonstrative reasoning for probable causes and principles (Kambaskovic and Wolfe 2014, 120). In this point, Harvey highlighted the experimental and diagnostic priority of the testimony of sight and touch (Harvey 1653, 68–415), and Sylvius established in a clear way the supremacy of this sensory binomial in the practice of anatomists (Sylvius 1679, IX, 22).

René Descartes (1596–1650), in the context of the discussion of the epistemic problems of knowledge, also questioned the implication of the senses in cognition. In the scientific method's development, he argued that an important step in understanding the procedure was to examine the instruments of knowledge (Cottingham 1992, 1–20). The intellect was the most basic, adding the imagination and the sensory perception. These formulations contributed to the justification of corpuscular philosophy and the enunciation of a

new theory on the senses (Hatfield 2008, 969). For the French philosopher, there was a relationship between the idea and the image of the sense experienced, rejecting, for example, that the light and heat were similar to sensations. Therefore, the Cartesian corpuscular world, of extension and movement, was not given to the senses manifestly. The sensory qualities in the bodies (smells, sounds, flavors, and tactile qualities) consisted of certain arrangements of corpuscles that possessed the properties of size, shape, movement, and position. This raised ruled out that, the Aristotelian formulation of color, as experienced in sensations, was totally analogous to color as a quality of bodies. In this theory, Descartes considered the external sensory perception, imagination, memory, and the pure intellection as different ways of a single power of perception, that is, as basic operations of the intellect. Of these faculties, sensory perception, imagination, and memory depended on the mind-body interaction. Instead, pure intellect could operate without changes in body state (Hatfield 2008, 970).

In this context, Thomas Hobbes (1588–1679) argued that the senses acted through movement. This thesis was developed over several works – *A Minute or First Draught of the Optiques* (1646) and *Elementorum philosophiae sectio prima De corpore* (1655) – in the research about light, vision, reflection and refraction, and sensory perception (Prins 1996, 145). This approach to sensory issues respected a logical order: it began with light and its reception by the sense of vision and continued with sensation, imagination, and memory. Hobbes explained the vision as a consequence of established movements in the “sense organ,” identified with the optic nerves, the brain, and the heart.

Impact and Legacy

During the Renaissance, different thinkers took up ideas on sensory topics bequeathed to them by the classics and the medieval, in order to be able to explain more concisely the relationship between

sensation and intellect. One of the legacies of this period was to introduce uncertainty about the process of perception and cognition, which created a “sense paradox” (Pender 2014, 132) because, while perceptions were decisive in the body’s research, diagnosis, and treatment, its reliability in the transmission of information began to be questioned. The “sensation” became more suspicious over the course of the sixteenth and seventeenth centuries. As a result, the functions and representations of the inner and external senses began to become more complex, as well as their relationship to each other, along with spirit and cognition. In conclusion, during the Renaissance period, the senses were configured as objects of philosophical inquiry and mechanisms of knowledge of the body, thus fulfilling a fundamental role in debates around the reason and material nature of man.

Humanism

Timothy Kircher
Guilford College, Greensboro, NC, USA

Abstract

This entry examines the humanist articulation of three key philosophical relations: being and seeming, virtue and fortune, and stasis and mutability. These relations address matters of epistemology (knowing), ethics, and ontology (reality). Humanists, when grappling with these concerns, resorted to alternative approaches. They identified reality on the basis of the stability of reason, which could ground an objective view of things. In this sense, they became *finders* of wisdom. Or, as *seekers* of wisdom, they acknowledged the transience of phenomena, which they confronted in their awareness of illusion and limited vision. If they grounded their role as objective expositors of the truth of things on the traditional concept of the *animal rationale*, they also celebrated the new force of the *homo ludens*, the philosopher at play, who participates in the unveiling of reality through masking and seeming, and also intersubjectively, through conversations with others.

Classical tradition; Dialogue; Learning; Rationalism

Heritage and Rupture with the Tradition

One of the central puzzles of Renaissance philosophy is its relationship to humanism. The relationship appears more opaque in modern scholarship, which often uses a philosophical vocabulary and conception alien to those of humanists. While scholars have presented diverse viewpoints on the relation between humanism and

philosophy, we may appreciate these viewpoints as two, often conflicting conceptions.

One group of scholars has assessed the humanist philosophical contribution according to its systematic exposition of the fields of epistemology, ethics, and ontology or metaphysics. These include James Hankins (2007), Robert Black (1998), and others, who have followed the lead of Ernst Cassirer (1927) and Paul Oskar Kristeller (1979). By the measure of systemic method, they have found humanists philosophically bereft. Humanist writings were too committed to rhetorical eloquence, too digressive, and too devoted to the study of classical literature. Those Renaissance authors who explicitly discuss matters of metaphysics, such as Nicholas of Cusa or Marsilio Ficino, are recognized as philosophers rather than humanists, even though they shared with humanist colleagues' common ideas, books, and literary genres. For these scholars, the philosophical domain that humanists traversed was in ethics or moral philosophy, though here as well humanists followed earlier thinkers and seldom registered anything original or profound.

Another group of scholars, in contradistinction to the first, has valued the situational, unsystematic features of humanist works as part and parcel of their philosophizing. Among these scholars are Eugenio Garin (2005), Ernesto Grassi (2001), and more recently Nancy Struever (1970), Christopher Celenza (2004), and Lodi Nauta (2009). In their view, humanist works address the historical and experiential dimension of the human condition, whereby philology and rhetoric show the ways that humanity negotiates the meaning of things, in a specific context. Humanity, according to Garin, "discovered itself [in the Renaissance] as the maker of itself and its world" (Garin 2010).

Despite the efforts of this second group, skeptics still consider humanist writings to lack philosophical incisiveness. Those scholars exploring humanism's rhetorical and philological orientation, while underlining its antimetaphysical qualities, nevertheless need to bridge the gap between the history of ideas and history of philosophy, a relation that also embraces the history of literature.

Until this gap is overcome, each side in the debate over humanism's role in the history of philosophy can deny the historicism of the other. The skeptics in the first group can claim that their view of both humanism and philosophy is sounder and more respectful of disciplinary distinctions that help chart historical developments. Their opponents in the second can assert that these disciplines themselves possess no *a priori* or transhistorical value but rather have acquired modern meanings that do not easily square with humanist activities and ideas. If humanists wrote Lucianic satires of the philosophical tradition, does that make them unphilosophical (or, for that matter, philosophical)?

To take on this conundrum, in all its postmodern resonance, we must not simply examine concepts but also weigh images. For the most fruitful moments in humanist philosophizing occurred across the disciplines that the humanists celebrated: rhetoric, history, philosophy, grammar, and poetry. Francis Bacon, at the close of our period, wrote "*poesis doctrinae tanquam somnium*": "poetry is like a dream of philosophic love" (Huizinga 1950, 119). Enchanted by rhetoric and poetry, humanists expressed their philosophical investigations through vibrant language, whereby they resorted as much to imagery as to concepts.

The humanist imagination could therefore be simultaneously artistic and philosophical, just as Renaissance artists portrayed the love of wisdom in their creations. Andrea Pisano created figurations of this desire as *Dialectic* for the Florentine bell-tower as did Agostino di Duccio, when decorating the Franciscan church in Rimini in line with the ideas of Guarino Guarini. Michelangelo expressed the humanist philosophizing most profoundly in his *New Sacristy* at San Lorenzo. In marking the passing of the Medici princes, the Sacristy added mystery to the dimensions of time and space. This mystery achieves personification in the seven statues: the two Medici dukes, the four deities, and the Virgin and Child. Duke Giuliano is seated over the statues of Night and

Day, who display the alternate features of female and male, sleeping and waking, and closed and open postures.

These sculptures have been viewed through a Neoplatonic lens, with the exchanges among them conveying the flow of time that is surmounted only by a turning toward the heavens and divinity. The Dukes, dressed in Roman garb, are turned toward the Virgin, and the visitor is constrained, by the confines of the space, to look upward above the linear pilasters and cornices toward the circular dome and its symbolic eternity.

The abiding impression, however, is one of movement.

Like Michelangelo, humanists “awakened” and adapted classical models to convey philosophical questions. We examine the humanist articulation of three key philosophical relations: being and seeming, virtue and fortune, and stasis and mutability. These three relations have preoccupied thinkers and artists both inside and outside the philosophical tradition. As readers of philosophy, we can associate the humanist relations to matters of epistemology (knowing), ethics, and ontology (reality). These domains, too, are permeated by exchange with one another. For one’s thinking, humanists emphasize, attends one’s way of living, and one’s life submits to the sway of time and history.

Humanists, when grappling with these philosophical concerns, resorted to alternative approaches. They identified reality on the basis

of the stability of reason, which could ground an objective view of things. In this sense, they became *finders* of wisdom. Or, as *seekers* of wisdom, they acknowledged the transience of phenomena, which they confronted in their awareness of illusion and limited vision. In the first approach, as finders, they more directly adapted the doctrines of classical and medieval philosophy. With the second, as seekers, their philosophical activity was concealed from systematic purview; with stylistic ingenuity, humanists posed riddles and employed artifice in order to disclose the nature of reality. If they grounded their role as finders and objective expositors of the truth of things on the traditional concept of the *animal rationale* (the Latin rendering of the Aristotelian ζῷον λόγος ἔχον), they also celebrated as seekers the new force of the *homo ludens*, the philosopher at play, who participates in the unveiling of reality through masking and seeming, and also intersubjectively, through conversations with others.

These two approaches confront us with a basic question: to what extent do the humanists’ obvious discussions of virtue and ethical behavior have deeper dimensions, which we may explore by seeing how they understood reality, and the ways reality became manifest to them? Their investigations of epistemology and ontology, in fact, allow us to appreciate their ethical discussions in a new light.

Being and Seeming (Epistemology)

Cicero’s *De amicitia*, a favorite humanist text, proclaims: “For only the few want *to be* endowed with virtue *rather than to seem* so [*esse quam videri*]” (*De amicitia* 26). The phrase “to be rather than to seem” became a watchword for conducting one’s life in the pursuit of virtue and happiness, an alignment amenable to the humanist reading of Stoics, Epicureans, and Peripatetics. Lapo da Castiglionchio the Younger (1406–38), who recorded the humanist commonplaces in his letters, advised the young Roberto Strozzi to

“choose in all things to be rather than to seem” (BAV Ottob.lat. 1677, ep.34). The moral mandate was not easily met, and humanists turned to confront its epistemological challenge. They viewed the world as a shadow play, full of hypocrisy and disguise. In trying to identify the covert intentions of princes and peers, the humanists often wore their own masks, using personae in their quest for sincerity and authenticity. These personifications present their philosophical puzzles, asking readers to decipher authorial meaning. Some humanist writing is relatively “closed” with respect to its hermeneutical latitude, relying on manifest statement (Cox 1992). But humanists frequently dressed their philosophizing in dialogue, using various interlocutors, or in poetry, fables, or novels. When humanists proclaim the nature of “being” or “truth,” in the sense of objectively identifying the nature of things, their readers also encounter personal features of the proclamation, exhibiting features of the moment, circumstance, or mood. If personality occasionally appears transparent and direct, it may at other times seem consciously feigned and more deeply disguised. The spectrum is broad.

Speaking in the first person, Leonardo Bruni (c. 1370–1444) composed his *Oratio in hypocritas* in 1418, inveighing against them as those who strive “not to be, but rather to seem or appear good” (Bruni *Oratio*, 1996, 316). Hypocrites are malevolent players on the cultural stage, who, by wearing false masks [*alienas personas*], delude or play false both God and humanity alike.

In this brief speech, Bruni displays the twofold quality of humanist epistemology, of finding and seeking the truth. First, he employs language in order to unmask hidden reality and reveal its objective nature for the entire world to see. Bruni and other humanists therefore embrace a variation of the correspondence theory of truth, akin to the medieval scholastic conception of “aedequatio rei et intellectus,” i.e., a statement expresses the truth of things insofar as language reflects or corresponds to reality. Second, the *oratio* underlines how language itself is generated out from and speaks to personal relationships between the speaker and his audience. Bruni criticizes the hypocrites in the words of someone

familiar with their treachery. For they, he claims, deceived him, who once trusted them. (Bruni 1996, 310). Through a discursive context, humanist speech illuminates reality and in fact shines a light on its concealment.

Humanist epistemology moves between these two positions. In the first place, by objectively identifying reality, humanists stripped away or exposed the mask of seeming; they consistently espied the mendacity in the world around them. And secondly, by appreciating the dynamic, intersubjective conditions of knowledge, they realized how their given relation to others conditioned their perceptions of the phenomena before them. The tension within their approach to knowledge moved them to adopt the form of dialogue in their inquiries, since this genre brought the two positions to bear on one another. The humanist adaptation of classical dialogue, whether Ciceronian, Platonic, or Lucianic, is indebted to this struggle to confront, in alternate ways, the problem of being and seeming, as it pertains to knowledge.

About 30 years after Bruni’s *Oratio*, his colleague Poggio Bracciolini (1380–1459) composed the dialogue *Contra hypocritas*. Poggio sets the dialogue in the Florentine library of the Aretine humanist Carlo Marsuppini, in which Poggio himself is present. Marsuppini immediately agrees with Poggio’s indictment of clerical dissimulation, calling the curia a “kingdom of hypocrites” (Bracciolini 2008, 7). Girolamo Aliotti, a humanist abbot, joins the two speakers. Aliotti, similar to Bruni, turns to definitions. Hypocrites would seem better than they actually are (Bracciolini 2008). With sincerity a moral value, the humanist language also appears straightforward and sincere, contrasting and distinguishing what is from what seems to be.

If Poggio’s epistemological challenge first showed itself as obvious – using language to identify deception and unmask the face of seeming – the dialogue raises deeper dimensions of the problem of knowledge. Aliotti broadens the scope of hypocrisy by claiming that people simulate in every trade, including both intelligent and good people. Therefore it is very hard, if not impossible, to discern their true natures behind their personae. The focus shifts from unmasking deceptions

practiced by others to pondering the sincerity expressed by the speaker and examining how genuine or fraudulent his or her expression appears to be. Aliotti emphasizes the depth of people's covert meaning.

This epistemological uncertainty finds its center in the humanists' phenomenological awareness. The filters of personality mask all things; there is a limit, and a finitude, to human insight into the nature of seeming that qualifies all objective assertions. The positions of the humanists too are transitory. Marsuppini changes his viewpoint over time, in the course of the conversation. The humanist dialogue, as a philosophical form of expression, showcases a mobile understanding, in which interlocutors modify their views as they continue to confront their shifting perceptions throughout their conversations with others.

These humanist conversations are akin, in tone and form, to philosophical riddle contests, in which speakers, as agonists, present problems to one another that are illuminated, if not resolved, by the intersubjective exchange. The *homo ludens* provokes the argument that demands a response, even by contemplating hidden meanings. "I consider no honest game completely devoid of edifying purpose," states the Cardinal in Cusa's dialogue *De ludo globi*, as he embarks with his interlocutor to uncover the nature of the universe symbolized by the newly-invented ball game.

Humanist dialogues therefore acknowledge the fact of intersubjectivity, and they convey their philosophical inquiry with historical inflection (Zorzi Pugliese 1995). Following Cicero's practice, humanists could present historical speakers in order to grant certain gravity to the topic under discussion. Yet they could also qualify the authority of these interlocutors through the history of the narrative: narrative time reveals the shifts and vacillations in their viewpoints, as it does with Marsuppini. Interlocutors, and by extension readers, may reconsider their perceptions as they exchange views. Here we may draw a comparison to Platonic dialogues. By inducing *aporia*, Socrates often persuades his interlocutors to abandon, or at least question, their initial positions. These reversals, however, tend to confirm Socrates's

authority. Humanist dialogues, in their most open and nondidactic form, lack this stable point of reference: all interlocutors are subject to question. At polemical moments, humanist dialogues, such as the *De exilio* of Francesco Filelfo (1398–1481) or the *De vero bono* of Lorenzo Valla (1407–57), present their authors' enemies as upholding dubious philosophical positions. Leon Battista Alberti (1404–72), for his part, put forward his own persona, at various stages of life, throughout his work. Deeply engaged with the theory and practice of art, Alberti pondered the presence of appearances, for example, by outlining the system of linear perspective in his treatise on painting.

In Alberti's most famous dialogue, *Della famiglia*, Alberti's uncle Lionardo speaks to "Battista," Alberti's youthful persona, about how their conversations differ from the treatises of "philosophers." Philosophers pursue, he says, every implication of their "most obscure and difficult investigations," whereas the humanist household discussions do not aim for such glory (Alberti 1960, 1:84). Whether or not Battista, or the reader, takes Lionardo at his word strikes at the heart of the humanist's inquiry into the nature of being and seeming. The familial dialogues engage several philosophical subjects, such as friendship or the power of fortune. They include a discursive, witty commentary on Aristotle's *Nicomachean Ethics* 8, in which family members discuss the nature of friendship by focusing on the relation between being and seeing and on ways of discerning good will from dissembling.

More fundamentally, Lionardo modifies his views intersubjectively, in response to the moment of discourse and his awareness of those present. His knowledge of their way of life affects, he says, how he expresses his point of view. Philosophical inquiry is, by these lights, a type of game, in which Lionardo, and his listeners, come to understand the orientation of others. Therefore Alberti's epistemology, like that of other humanists, does not adhere to a scholastic logical analysis, or to a strict imitation of Ciceronian *disputatio in utramque partem*. Rather it allows for intersubjective play, by accounting for the personalities involved. In this intimate

exchange, the personal becomes a key modality in philosophical thinking. The characters advance their awareness by knowing one another: they carry a sense of other's history, and this history, as it changes, also shapes their shifting thoughts and impressions. Acquiring knowledge is always a problem and a test. Readers of the humanist works must negotiate the meaning of these *personae* as they present themselves in the course of the text, or paratext.

Alberti's Tuscan vernacular associates the verb *parere* ("to seem or appear") with the neo-Latin *videri* as its counterpart. Both convey the sense of seeming and appearing, disguise and disclosure. Writing *Della pittura* prior to the Latin version *De pictura*, he states, "Know that a painted thing will never appear [*parrà/videri*] truthful where there is not a definite distance for seeing it" (Alberti 1973, 3:38–9). When searching for knowledge, humanists strove to unmask what lay before them. The unmasking could entail objectifying and declaring the reality of things; it could also require patient receptivity to the way phenomena unfold over time, as one encounters them in dialogue or in observations that are conditioned by the presence of others.

This Quattrocento epistemology has precedents in the fourteenth century, with the ludic yet serious investigations of Petrarch and Boccaccio. Both humanists used various personae in their works, at times autobiographical (e.g., Petrarch's Silvius in the *Bucolicum carmen* and Franciscus in the *Secretum*). These writers established the basis for the humanist consideration of authority, whereby a speaker, no matter how distinguished, could qualify or even undermine his pronouncements through contradiction or vacillation. Their poetic understanding viewed the world through the prism of personality and also remained alert for reversals of meaning on the basis of changing appearances. Although Quattrocento humanists seldom praised their Trecento forebears, they became a critical medium through which they understood the relation between being and seeming.

Petrarch's dialogues, as well as Boccaccio's *Decameron*, show the mutable use of *personae* in the search for knowledge. The *Secretum*

showcases Augustinus, Petrarch's figure for his beloved St. Augustine of Hippo, guiding the troubled Franciscus through an inquisition into his psychic distress. In his *De remediis utriusque fortune*, Ratio, the disembodied voice of rational certainty, tries to steady the emotions of Metus (Fear), Spes (Hope), Dolor (Sadness), and Gaudium (Joy) as they express reactions to various life situations. Both Augustinus and Ratio would speak with knowledge of moral clarity and reflect Petrarch's devotion to the Christian and classical traditions. This devotion, in which Petrarch engaged until his dying breath, nurtured his creative thinking. The dialogues, like his many letters, seal their authority with the impression of truth: in the *Secretum*, the figure of Veritas (Truth) introduces Augustinus to Franciscus. Yet their sovereign interlocutors are also colored by ambiguities. Augustinus is at times more Stoic than Christian, overlooking the role of grace; he also cites classical authorities when counseling Franciscus to abandon his study of literature. The entire dialogue, too, records Franciscus's own vision and therefore relies on the memory of the imagined author, who is subject to the vagaries of time and poetic embellishment. The *De remediis* appears less problematic and more immediately didactic. But Ratio's truth-telling often resorts to rhetorical suasion, an appeal to emotion while contending with the power of the four passions. Ratio is dumbfounded at one point by Sadness's distress over severe pain, and it modulates its advice to the point of inconsistency, according to the cases it confronts, yielding to religious dogma when facing the fear of death.

With respect to Boccaccio's greatest work, the *Decameron*, humanist readers appreciated its subtle thinking on the complex relation between being and seeming. Deception is the keynote of its many tales, which often target clerical hypocrisy, and there are no less than five stories featuring the con artists/painters Bruno and Buffalmacco, who, like their author, enjoy playing games with people's perceptions. The reader must discern the meaning of the work, whether in whole or part, through the multiple narrative frames: of authorial persona, of the ten storytellers, and within the stories themselves. As

in other humanist dialogues, the storytellers or *brigata* highlight the fact of intersubjectivity, as they respond to one another's intentions and lessons over the course of two weeks' time. They communicate and revise their understanding of philosophical themes – virtue, friendship, fortune – during this time, shifting their perspectives as they come to know each other. Shading all their leisured conversation is their awareness of life's finitude, for the Plague has cost them kinsmen and chased them from their native city.

Both *trecento* humanists advanced their vernacular inquiry by using the verb *parere* as the Tuscan equivalent to *videri*, and set the precedent for later humanists. Connoting illusion, *parere* repeatedly marks the scrupulous and theatrical hypocrisy of Cepparello, who deceives the pious friar confessor (*Dec.* 1.1.36) (Boccaccio 1992); the verb expresses the work of Bruno and Buffalmacco, who, by creating false impressions, persuade the hapless Calendrino that he seems pregnant, in order to relieve him of his inheritance (*Dec.* 9.3.8-15). But Pampinea in the opening of the *Decameron* also uses *parere* in realizing the mortal effects of deadly disease that move her to advise others to leave Florence (*Dec.* 1.Intro.60). Thus *parere* also conveys a moment of disclosure, as when Abraam discovers the wickedness of the Roman clergy, which in turn reveals to him the greatness of the Christian religion, since it has increased its influence despite their duplicity (*Dec.* 1.2.23-26). In this vein, the reader can understand how reality may become clear, when shorn of outward simulation. New knowledge may dawn upon someone as the mists of illusion or confusion dissipate, as he or she learns, through life experience, to perceive the efforts at mystification or seeming. This path of thinking is brightened not so much by forceful ratiocination as by patient apperception, often of the illogical or unexpected, as it presents itself. Abraam recognizes the illogical or unexpected on account of his historicity: the past, in recollection, extends itself into the present, shaping his apperception of his place in the world.

Petrarch's vernacular poetry also concerns itself with these epistemological issues. While his verses identify at times reason's ability to

restrain the passions, in the vein of the *De remediis* (e.g., *Rvf* 97, 140, 141, 189) (Petrarch 1996a), they continually wrestle with the presence of deception. In a sestina, the poet weeps over his lady's concealment by fog and wishes for the sun to disperse it (*Rvf* 66.23, 39). A later canzone elaborates this view, in that his *donna* showed him “pur l'ombra o 'l velo o' panni / talor di sé, ma 'l viso nascondendo [just a shadow, or veil, or garment / or her true self, while hiding her face]” (*Rvf* 119.20-21). In more Neoplatonic fashion, he states that the Po River can transport his *scorza*, his external form, but not the inner spirit (*Rvf* 180.1-3). The turning inward, to see the essence beneath surface appearance, is also, in context of the poet's collection, a turning outward: the poet holds his conversation not merely with himself but also with his lady, with Love, and with the world of his readers. Similar to Boccaccio and other humanists, Petrarch offers the conversation to readers' decipherment, asking them to weave the fragments together in time and over time through memory.

As inwardly directed as Petrarch's poetry tends to be, it shares with the *Decameron* an abiding intersubjectivity, an ongoing exchange with their world in their efforts to discern the real and know the truth of things. His verses locate the encounter with appearances also through the verb *parere*. Thus time seems or appears (*par*) to streak the poet's hair with age (*Rvf* 83.3). A sonnet invents a dialogue between his heart and eyes, with the heart accusing them of false and distorted judgment: “Non son, come a voi par, le ragion pari [the reasons are not of equal standing, as it seems or appears to you]” (*Rvf* 84.9). In another sonnet, the poet himself speaks of the difficulty of seeing the truth, in this case of knowing how genuine the pity may be in Laura's demeanor: “e 'l viso di pietosi color farsi / (non so se vero or falso) mi pareo [her face appeared to me, turning the color of compassion, I do not know whether false or true]” (*Rvf* 90.5-6). The poet recalls Laura in all her beauty, commemorating the ephemeral moment in its elusiveness, and marking it as singular. *Parere*, more meditative and, in this sense, more “philosophical” than in the prose of Boccaccio, attains a contemplative climax in the *Trionfi* where, from

the poet's loftier vantage point, he constantly sees (*veggio*) the passing spectacle before him. Echoing Pindar, he draws the conclusion in the *Triumphus temporis*: "Che più d'un giorno è la vita mortale? / Nubil' e brev' e freddo e pien di noia, / che po bella parer ma nulla vale [How more than a day is mortal life? Fragile and brief, cold and full of pain, it can appear beautiful, but it does not remain]" (61–63) (Petrarch 1996b). Life can have its splendor and can be beautiful at its shining moment. But the moment can also be deceptive; it is fleeting and, because of memory, one and only. In Petrarch's design, time's parade is followed by the triumph of eternity, though this too is seen by earthly lights: "veder mi parve un mondo / novo, in etate immobile ed eterna [a new world appeared before my eyes, one stable and eternal]" (20–21).

Petrarch's final *Triumph* and his dialogues underscore the religious dimension to his inquiry into being and seeming. This dimension often disappears from view among Quattrocento humanists, with notable exceptions such as Antonio da Rho, Ambrogio Traversari, Girolamo Aliotti, and Nicholas of Cusa. By the Cinquecento, Niccolò Machiavelli (1469–1527) and Baldassare Castiglione (1478–1529) were understanding simulation as more a practical than moral problem. The prince should be a fox, who uses underlings to execute unpopular measures; the courtier must practice *sprezzatura*, the bearing that makes the artificial seem natural (Castiglione 1987).

The courtier, the painter, and the humanist therefore "are of imagination all compact"; they express things that may not be. The humanist asks about the philosophical meaning of this seeming and masquerade. Desiderius Erasmus (1466–1536), in his *Stultitiae laus*, has Folly pronounce on various shades of wisdom and foolishness. If we examine these shades in the following section, we focus now on the more self-conscious conundrum that Erasmus poses in this version of the liar's paradox. At the heart of this conundrum stands the figure of Socrates, for he is represented by the Silenus who is outward ugly but inwardly beautiful. Seeming here masks being and reality, so Folly proclaims in her didactic oration. And yet

seeming must be maintained: "What is the whole life of mortals but a type of comedy, in which various actors, disguised by various costumes and masks [*personis*], walk on and play each one his parts, until the manager waves them off the stage?" (Erasmus 1969, 36–7).

We are not far, at this point, from the more tragic conclusion of Shakespeare's *Macbeth* (Act V, scene 5). But Folly speaks in a comic vein, vividly captured by Pieter Breugel's *Proverbs*. François Rabelais (1494–1553), who wrote at least one letter to Erasmus, displays this humanist awareness with spectacular hybridity. Aware of Inquisitorial censorship, his play with appearances is more explicitly satirical. *Gargantua and Pantagruel* is blistering in its attack on religious hypocrisy. The novel is richly inflected, as Mikhail Bakhtin has noted, with heteroglossic narrative, whereby the expressions of high and low culture are understood through their ongoing exchanges with one another. The prologue to *Gargantua* recalls the Silenus and Socrates, who was "always playing the fool, always dissimulating his divine wisdom" (Rabelais 1994). So too his ribald episodes, the author says, may disclose hidden meaning. But be wary, he adds, of those erudite scholars from Plutarch to Poliziano, who mine allegory in everything Homer and Ovid wrote. With Erasmus and Rabelais, humanist epistemology turns upon itself. Its self-parody simultaneously questions and validates its worth.

Virtue and Fortune (Ethics)

The humanist epistemology directly conditioned their thoughts on ethics. Hypocrisy was, to their way of thinking, a moral problem. They were preoccupied by how one dwelled in the world and one's character (*ethos*) in relation to others. Ethics therefore is often at the center of their philosophizing, as humanists pondered right courses of action and the extent of one's moral freedom to realize them. If the hill of virtue was famously steep – an image they reprised from Hesiod – one made decisions along the way. And what is of greater help in these decisions than philosophy? Bruni writes in his *Isagogicon*

moralis philosophiae that philosophy can disperse the gloom that conceals the true way of living and counter humanity's blindness (Bruni 1928). Matteo Palmieri (1406–75), in his vernacular dialogue *Vita civile*, has the leading interlocutor maintain that philosophy can help inculcate the proper and approved habits and virtues (Palmieri 1982). Both Bruni and Palmieri place their trust in what they called the *honestum*: the moral good, and idea derived from Cicero and the Greek *to kalon*, connoting both inner rectitude and outward reputation. Prudence or right reason (*recta ratio*) is the key virtue guiding their readers' on life's way. Since many philosophical schools stressed the leading role of rationality, humanists from Bruni to Giovanni Pontano (1426–1503) integrated Stoic, Neoplatonic, Peripatetic, even Cynic elements into their ethical thought. In Pontano's dialogue *Charon*, the infernal ferryman discusses these schools with Minos, Mercury, Diogenes, and anonymous shades in order to examine the nature of the moral good, which relies on the superiority of the mind (*animus*) over the body (*corpus*) (Pontano 2012).

Pontano's *Charon* partakes in a long legacy of tales about the ferryman, not only via Dante but also more proximately through humanist translations of Lucian's dialogue and, as we shall see, Alberti's novel *Momus*. That the ferryman philosopher should meditate on the mind's liberty after death is in the spirit of humanist play, a creative conversation rising above its source in Cicero's *Tusculans*: "what, I say, are we to do unless summon the mind to itself, forcing it to be with itself, and with every effort leading it away from the body? To separate the mind from the body: what is that other than to learn how to die?" (1.31.75). By placing the mind outside the body's mortality, humanists, following Cicero, could make death a greater abstraction, even though this detached position is also subject to ludic reversal and commentary.

But certainly the mental focus magnified virtue's rational aspect. Therefore humanists emphasized that one could learn virtue by studious application, especially with respect to past authorities. Pier Paolo Vergerio (1370–1444), in his *De ingenuis moribus*, notes that literature is

particularly helpful to forming virtue. Writing to a young Florentine, Lapo rates the literary training the ancients practiced as the firmest ground for virtue and learning, and in Alberti's dinner piece *Fatum et fortuna*, a philosopher recounts a dream, in which shades employ the liberal arts as a means of navigating the currents of fortune (MS BAV Ott. lat. 1677, ep.1; Alberti 2003a, 41–57). Francesco Filelfo's dialogue *De exilio* calls the virtues *bonae artes*, liberal arts, for these both make and declare men good (2.162) (Filelfo 2013).

The optimistic credo of learning virtue continues into the sixteenth century. In his *Enchiridion militis christianae*, Erasmus urges the reader to follow the Platonists, and likewise his *Institutio principis Christiani*, written 3 years after Machiavelli's *Il principe*, relies on Platonic precepts. Juan Luis Vives (1492–1540) prefaced his *De tradendis disciplinis* by stating that the branches of learning [*disciplinae*] restores our humanity and indeed uplifts us toward God (Vives 1551).

These remarks sound the adage that reason liberates the soul from the bondage of the passions, a strain of thinking that the humanists inherited from the classical and also the medieval moral tradition. The truism surfaces in Petrarch's *De remediis*, Coluccio Salutati's *De laboribus herculis*, and in Marsilio Ficino's contemplation of the image of the charioteer in the *Phaedrus*. Plato declares reason a charioteer, he writes to Giovanni Nesi, while the horses represent the force of the heart and liver (letter 4.27) (Ficino 1985).

The virtues may, in this respect, overcome the turbulence of the passions, and indeed, as for Ficino, harness the force of the heart's magnanimity. And so this conception provided humanists with grist for their moral mills. For the humanists, too, the greatest opponent of virtue was not the unruly passions or even vice but fortune. In their conception, she was, like the emotions, unstable, but she embodied the accidents of birth and circumstance. She balances precariously, in Pinturicchio's fresco, on the ship of life, with her arms holding a sail filled by shifting winds. Humanists therefore glimpsed fortune with a

double vision: not only as one's "hap" or accidental condition but also in the sense of the inherent capriciousness and mutability of life itself. Translating Plutarch for Cosimo de' Medici and Nicholas V, both Lapo and Niccolò Perotti (1429–80) maintain the power of reason and virtue in mastering fortune's whims. Rational ethics therefore can find one's proper path in life and guide one toward safe harbor.

But the turns of fortune provide opportunity or *occasio* as well. Virtue, no matter how well-founded on right reason, must contend with existential contingency. In Alberti's *Fatum et fortuna*, fortune's river brings the chance to embrace the humanities that allow an understanding of her currents; Aeneas Sylvius Piccolomini's *Somnium de fortuna*, another dream vision, celebrates Alfonso of Naples, whose virtue allows him to transfix *fortuna / occasio* by seizing her by the hair. The image of fortune therefore connotes temporality and change. Petrarch explores this dimension with the shifting cases and counsel of his *De remediis*, and in his late *De sui ipsius et multorum ignorantia*, stresses how *senescunt fortune*: one's fortunes grow old, too, along with one's life (Petrarch 2003).

Both aspects, circumstance and change, are present in Machiavelli's treatment of fortune in *Il principe*. If the bold ruler must beat and bend fortune to his will, that disturbing metaphor is mixed with a second, that of the river god. Here, rulers meet with success in preventing its floods at most half the time (ch. 25) (Machiavelli 2006). Rational virtue or amoral *virtù*, cunning, therefore have their limits. Poggio, more melancholy in his later works, writes in the *De varietate fortunae* that everyone has a role in the "theater" or "game of fortune"; those in power, by disdainning virtue, are first raised and then cast down by fortune, who unmasks their folly (Bracciolini 1993).

In the ethical domain, humanists refer once more to the theater of illusion, with actors misguided about the parts they play. Francesco Guicciardini (1483–1540), Machiavelli's correspondent, notes that fools often accomplish more than the wise because they rely more on fortune than on reason (Guicciardini 2013). Erasmus's spokesperson Folly proclaims a similar view,

presenting Rhamnusia or Nemesis as the *fortunatrix* of human affairs, who favors bold fools. While the Stoics consider themselves wise and virtuous, they are the most deluded and unaware of the reality of things.

The link between learning and virtue, erudition and ethics, common in many humanist treatises, receives its ironic reversal. Those who think they have learned the way to virtue may in fact be lost. This reversal has its own tradition within humanism, countering and in fact transforming the ethical commonplaces. Boccaccio's *Decameron* recounts comeuppances of not only the powerful, but also the educated, such as the scholar Rinieri (8.7) and Master Simone the physician (8.9); and Petrarch, in the *De ignorantia*, distinguishes between learning and moral wisdom: reading Aristotle's ethical writings increased his erudition without improving his character.

As personified by Poggio's abbot Aliotti, Quattrocento humanists advanced their skepticism toward learning, even while they reinforced erudition's ethical import: such tensions and contradictions inhere in their bifocal epistemology. Life experience challenges what is learned and accepted from books as rules for living well, and in this challenge, life is thought's master. Lapo could praise the ethical teachings of the classics, but in the face of his continued misfortunes, he writes to a friend that he begins to doubt whether his books have been of any value to him (ep.8).

Lapo would regain his equilibrium and his faith in learning, just as Poggio kept his trust, despite fortune's sway, in reason's potency. Alberti for his part continued to question erudition's ethical value, from his early *De commodis et incommodis litterarum*, in which a student's library assails his flagging spirits, to the *Vita Sancti Potiti*, describing the martyrdom of an unlettered youth at the hands of Marcus Aurelius, and then in the *Della famiglia*, where Lionardo's learning yields to Adovardo's experience. The greatest charge is laid by his dinner piece *Defunctus* and his novel *Momus*. In the novel, Momus, the god of fraud, mocks the way philosophers deceive others with a show of goodness. Jupiter, sensing Momus's own rhetorical seeming, says he first thought Momus's character admirable

on account of its erudition, but now realizes the hypocrisy of scholars, who are most deceitful when they strive to appear upstanding (Alberti 2003b, 152). The *Defunctus* takes this learned show one step further. The title character is enveloped in learned self-deception; he cannot see, even from the standpoint of the afterlife, how his studious way of life fed his self-absorption, as well as the enmity of his kin.

Stultitia (folly), *delusio* (delusion), *dementia* (mindlessness), *insania* (deception, self-deception): these neo-Latin terms mark the shortcomings of the bookishly virtuous, who paraded their probity and prudence. Their writings showcase this parody of themselves, a type of inauthenticity, as the desire for fame, advancement, and a power occluded the deeper insight into human frailty. Nicholas of Cusa's dialogues *De idiota* also reveal learned pretense, as the layman confounds both orator and philosopher by drawing analogies from his rustic spoon-making. At the opening of the first dialogue, he tells the orator that his reading has only puffed up his pride.

The anonymous layman serves as a second Socrates in Cusa's dialogue. Erasmus would hide, as we have seen, his Socratic message in Folly's oration. For appreciating this vein of humanist ethical thinking, which places the burden of insight on the individual's life experience, there is perhaps no sixteenth-century writer better suited than Michel de Montaigne (1533–92). Writing "Sur des vers de Virgile," he says, "Learning treats of things too subtly, in a mode too artificial and different from the common and natural one. My page makes love and understands it. Read him [the Neoplatonists] Leon Hebreo [Judah Leon Abravanel] and Ficino: they talk about him, his thoughts and actions, and yet he does not understand a thing in it. I do not recognize in Aristotle most of my ordinary actions: they have been covered up in another robe for the use of the school." (Montaigne 1943, 666).

We encounter again the image and metaphor of masking, one often overlooked for its philosophical significance. In his *La cultura del Rinascimento*, Garin sees this passage as a jest and goes on to stress the elite nature of Renaissance Neoplatonists and their treatises on sublime love:

"without this Platonism, one cannot understand the Renaissance." Montaigne is making a more fundamental philosophical point for the period: that learning has become too often life's accoutrement, if not its hindrance, instead of its guide. Virtue requires a more natural element, which one finds in one's way of life, even though, for the humanists, life is often the plaything of time.

Stasis and Mutability: New Visions of Reality (Ontology)

The term "ontology" was coined after our period, and is often used interchangeably with "metaphysics," the study of that which is beyond *physis* or *natura*, in other words, its ground, the Being of beings. Few humanists speculated directly on this topic; here we may mention Ficino and Cusa, whom some scholars have isolated from humanism. Cristoforo Landino (1424–98), who exchanged letters with Ficino and presented him as a *persona* in his most famous work, speaks of "metaphysicians" and their theories of ultimate reality. But in addition to these specialists, humanists, as we have seen, wrestled with the meaning of reality, and their sense of reality conditioned their awareness of truth. Their ontological standpoint, whether explicit or implicit, informed their epistemology, and both shaped their view of ethics and the moral good. As Filelfo noted in the *De exilio*, the light of God may illuminate and warm the rational spirit both to know the truth and love of the good (2.159) (Filelfo 2013).

For many humanists, the point of departure was how time related to Being: did time rest in Being or an ultimate reality, or did it qualify reality itself, so much so as to make its origin or ground unrecognizable? With regard to the first relation, humanists would conceive being as stable and eternal, as an idea or deity that, in its transcendence, anchored the real and the true, and thus their objective view of things. As the alternative exposition, humanists pondered life's ineluctable finitude and viewed reality through the face of temporality, change, and mortality. This standpoint colored any higher reality and divinity, which appeared not stable, but mutable and

evanescent. The “finders” of philosophical insight could guarantee their vision on the stability of Being; the “seekers” felt themselves more adrift in a contingent universe, with the transcendent outlook more often clouded than illumined. To return to Michelangelo’s Sacristy: one’s view may rest the gaze on the Virgin or the circular dome; someone else may continue to look about, oscillating among the deities Night and Day, Dawn and Dusk. The Sacristy entertains both visitors, or the same one, who responds differently at different times. Humanists appreciated this diversity and vacillation of viewpoint, as they pondered the face of Being.

The humanists in the first group, who conceived of Being in its transcendent stability, often expressed this conception through allegory. The poet, as *vates*, grasped these eternal truths and masked them in images for the humanist to unveil. Boccaccio, in his *De genealogia deorum*, considers Jupiter the *summum bonum* and the source of life (2.2) (Boccaccio 2011). Reading Aeschylus via Cicero’s *Tusculans*, as well as Ovid, Servius, Claudian, and Fulgentius, he weighs the meaning of the figure of Prometheus, declaring the deity to be an apt *persona* for the true god. Prometheus not only creates humankind from clay; he also travels to heaven; from there he gives humanity the flame or brightness of knowledge from its divine origin (4.44).

Boccaccio’s exegesis is neither systematic nor consistent, as it finds a pattern in mythological narrative. Yet Boccaccio revisits the Neoplatonic allegorizing of the classical and medieval traditions, attributing to the divine being the stability, eternity, and rational light that is the source of all beings. Humanity, through rationality and culture, realizes its kinship with the divine and can see things in the light of truth. Coluccio Salutati (1331–1406), Boccaccio’s friend and correspondent continues this line of allegorizing in the *De laboribus Herculis*. Jupiter, the father of the gods, oversees humanity’s formation from all animate creation. Jupiter himself is the domain of reason, which provides a transformed humanity the light and fire of both reason and virtue (3.23) (Salutati 1951). In other words, Jupiter is the source of all created being, and as such,

grounds human knowing and right action, epistemology, and ethics.

Cristoforo Landino accents other features of philosophical allegory in his *Disputationes camaldulenses*. The title underscores its humanist hybridity: it is a *disputatio* or debate, drawing on the transformation of medieval university tradition; one held at a friary of the Camaldolensian order, whose ranks included the humanist prior Ambrogio Traversari (1386–1429), translator of Diogenes Laertius; and presenting a dialogue with *personae* of people still living, or recently deceased. These include Alberti, one of his Landino’s first patrons; Lorenzo de’ Medici, his current one; and Marsilio Ficino (1433–99). The interlocutors interpret allegory, particularly in their reading of the *Aeneid*, to demonstrate how one advances in knowledge and moral virtue. This moral allegorizing has an ontological foundation. Lorenzo equates Jupiter with the Platonic world soul, to which Alberti assents, declaring that God is the origin of everything (Landino 1980, 32, 42, 88). Ficino for his part proclaims God the “best of everything; Alberti calls God the “good of every good,” and, as a good, is by necessity stable (73, 75, 77–78).

The divine good, personified by Jupiter, is inherently fixed and the source of all other beings. In the dialogue, Alberti voices the scholastic argument that “the metaphysicians have confirmed that whatever is, derives its being from God.” God is both the highest good and the ground of Being. Thus all that is, is good in so far it has Being. Here, in a humanist dialogue, Alberti presents the logic of Thomas Aquinas, among other medieval thinkers (103–104). Landino’s dialogue therefore merges scholastic and humanist ontology in a way that grounds his objective understanding of knowledge and morality. The figure of Alberti consistently contrasts the Biblical sisters Mary and Martha in the traditional reading of the contemplative and active virtues and adds to this the Neoplatonic dimension of ascent.

Landino stages his portrait of Marsilio Ficino in order to complement those of Lorenzo and Alberti in their philosophical exchanges. In Ficino’s own works, he elaborates the humanist Neoplatonic principles of his predecessors and

contemporaries, particularly in his *Theologia platonica*, which he composed in the years just prior to Landino's dialogue. His commentary on Plato's *Philebus*, written also at this time, interprets classical sources for ontological purposes. It notes Plato's reading of Jupiter as the "divine mind" and cites Orphic texts that declare Jupiter the source of all things. As do the other humanists, Ficino conveys the divine being through the light metaphor (Ficino 1975, 238–45). Ficino is able, as an illumined hermeneut, to decipher this allegory and disclose its insights into the nature of reality and truth. The rational mind, if purged of earthly fantasy, may ascend to this more sublime understanding (Ficino 2006, 6.2).

Pico della Mirandola (1463–94), his great colleague, based his own philosophical conceptions on these same premises, as well as on those from other the humanist writings. Scholars have seen his *Oratio de dignitate hominum* (1486) heralding a new chapter in the philosophical thinking about human autonomy and self-fashioning. Yet the very structure of the *Oratio*, announcing a *disputatio* over his 900 theses, also underlines Pico's commitment to discoursing both with tradition and his contemporaries. Even while adding new concepts and sources, Pico shares in the humanist conventions of syncretic thinking and desire for debate. He hearkens to the humanist reading of Prometheus in his most celebrated claim, that humanity as "work of indeterminate form," which "should have joint possession of whatever had been peculiar to each of the different kinds of being" (Pico 2012, §17). Salutati had maintained that the Titan created humanity by taking features from all of animate nature (3.23).

Like his humanist forebears and contemporaries, Pico emphasizes the need to interpret symbols and figures in order to understand the nature of being behind surface appearances. Jacob's ladder from Genesis offers a fitting allegory of human ascent to the divine, from moral philosophy through dialectic to theological contemplation. The mysteries of the Hebrews, to his mind, are kin to those of the Greeks, requiring Pico to draw out their hidden meaning (§§71–81). He proposes, he says, to write a *Poetica theologia*, in order to disclose how Homer concealed

philosophical truth in the travels of Ulysses (§224). This project strikingly resembles Landino's enterprise in his *Disputationes*, of having Alberti reveal the *Aeneid*'s moral meaning.

Pico's ontology, similar to that of Ficino, Salutati, and Boccaccio, is suggested by this idea of disclosure and the symbol of light. As it is for these other writers, the light of being is also the light of knowing. He wishes that the Plato's light of truth might illuminate minds more brightly, like the rising sun (§§192 and 135). In this ascent of being and truth, the mind's eye would perceive the objective nature of things. Pico's optimism, and ambition, is to embark on the upward journey, beyond the thick shadows of earthly existence. If the first sentence of his *Oratio* boldly proclaims that "nothing can be seen more admirable than humankind," a humanist variation on Anselm's "nothing can be thought greater [than God]," Pico qualifies his admiration with a figure of speech: "on this earthly stage" (§1) Pico, like Ficino, claims to see behind the curtain and discern the ontological origins of human agency.

But not every humanist shared in this optimism. Poggio, we have noted, studied the "game" and "theater of fortune" in a more melancholy vein. Humanity has the potential, through virtue and reason, to challenge fortune's role as playwright and stage manager of human destiny, but few people, if any, succeed in realizing their own liberation. This concession to the theater of existence, embracing the whole person, body and mind, conditioned for many humanists the virtue of Stoicism and rationality in general.

Petrarch resorts to Presocratic dicta in challenging the findings of the rational mind. Heraclitus becomes for him a favored authority. Commenting on the epigram, "in the same river we step and do not step," Petrarch sees the river as the flow of time: "The state of one's mind, the ebb and flow of life, and all aspects of existence are such that they seem to have been immersed in the all the rivers of Tartarus" (Petrarch 1958, 58). In the *De remediis*, Heraclitus's saying "everything exists by strife" moves him to contest notions of philosophical harmony and serenity and instead emphasize elemental discord in both the outer and inner worlds.

Lorenzo Valla, Poggio's erstwhile adversary, also maintains this qualification of cosmic tranquility. If Poggio sees human frailty as potentially remediable, Valla suggests that the human condition is existentially limited and benighted; humanity's ontological participation in divine being appears unrecognizable, although to God, all things are possible. His Epicurean interlocutor in the *De vero bono*, Maffeo Vegio, attacks contemplative virtue for pretending to exalt the soul above bodily sensation. He mocks the trope of contemplative ascent, for it pertains little to divinity, which already possesses perfect knowledge and moreover such an effort is wearisome (Valla 1977, 2.28.16). In the dialogue's final book, the Franciscan humanist Antonio da Rho asserts that the divine mysteries impenetrable even to the sharpest minds. Moses veiled his face on Sinai, and human faces remain captive to their corporeal coverings. Humanity, like all other beings, is confined to the earthly stage, as if ontologically apart from the deity. The ways of the divine are incorporeal and beyond corporeal perception (3.19.1). Valla therefore adopts Neoplatonic imagery, and its light-metaphor, but only to heighten the *chorismos* or separation between heaven and earth. When he employs the figure of Jupiter in other writings, as in the *De libero arbitrio*, the allegory challenges the humanist reading furthered elsewhere: his Jupiter is of a different order, who may fashion human character to goodness or to wickedness.

This second sort of humanist, who questioned the ontological consistency between beings and their source, stressed mutability and temporal change. The world is the arena of human vision; it is where, figuratively or literally, gods and humanity encounter one another in and over time. Here truth may surface only within the flow of existence, rather than in atemporal rational certitude that the divine, as the stable, unmoved source of beings, guarantees.

Poggio wrote of the earthly theater run by fortune. To Valla, any philosophical allegorizing about ultimate Being and truth collapses under the earthliness of mortal intelligence: the divine face, or that of its Moses, remains veiled. Cusa and Alberti playfully pick up the humanist theme

of metaphors and masking. The gods, or God, also wear disguises in this time-bound theater. Ontologically, divinity can appear different from humanity; epistemologically, human vision is obscured. To humanists thinking in this vein, Being is not simply, in Neoplatonic fashion, the brilliant source of created beings; it rather shapes the world in the sense of the theater, the stage, and its temporal continuum, dimensions in which beings, including divinity and humanity, may present or conceal themselves. There is therefore no linear ascent to a higher, objective understanding. The supralunary vision is above mortal reckoning, which must glean its insights from the phenomena along life's way. And these phenomena present more puzzles than fixed, logical conclusions.

Cusa's *De visione dei* studies these riddles. Overtly a theological treatise, written to the monks of Tegernsee in 1453, it displays a number of concerns shared with other humanist works, in particular the meaning of appearances and the understanding of symbols. The author meditates on the face (*faciem*) of God, as portrayed in a painted image or icon. He uses a traditional metaphysical vocabulary, describing God an "absolute form" that gives existence to all things. But the Cardinal humanist focuses on the appearance of God, his face, which he also calls, with studied ambiguity, his sight (*visus*), indicating both which sees and is seen (Cusa 1985, 9.35).

Humanity sees only a changing image, since by nature, humanity is mutable. God's constancy is seen, paradoxically, by human inconstancy, for his vision or face remains true to mortal movements (6.20; 9.37). Like other humanists, Cusa's studies shifting perspectives on appearances. The divine communicates its being only through appearances, which are transitory, since "humanity can only assess things in human fashion." Those humanist thinkers who imagined the Neoplatonic notion of ascent sought a higher knowledge beyond the shadows of the cave, illumined by divine being and wisdom. Cusa however remains by the earthly veil: humanity only perceives things in succession, *unum post unum* (6.20; 6.22).

The divine, by contrast, is distinctly other. Symbol or analogy fails because it cannot access

difference, only similarity; Cusa uses analogy, as does Alberti, in order to highlight this failure and the alterity of the divine. The divine face is only seen, or seems, unveiled (*revelate videtur*) by entering into a dark silence beyond all human knowledge or conception. Thus even the “highest spirit of reason” (*spiritus altissimus rationi*), praised by Pico and Ficino, must be vanquished for this vision to become apparent (6.22; 9.39). Cusa’s philosophizing, like that of Valla, marks the limits of traditional metaphysics. Philosophers or humanists, when wondering about ontology and ultimate meaning, have only mortal vision.

Around the same time, while at the papal curia, Alberti ponders these matters of ontology and epistemology in his novel *Momus*. The work, the author declares in its preface, is nothing but a grand allegory in the tradition of the ancient poets and philosophers. His Jupiter should represent reason and virtue, and Alberti alludes to the interpretations of Boccaccio, Salutati, and Ficino. But this representation is *quasi per ironiam*, he adds: he focuses on the playful dissimulation that not only poets and philosophers but also divinity may employ. The allegory’s center does not hold. Jupiter is no less arbitrary and meretricious than other characters, and the central figure, the god Momus, is the god of fraud and deception. The novel delights in Lucianic parodies of philosophers. Apollo eavesdrops on their erudite conversations and finds them incomprehensible. Gelastus, the soul of a philosopher wandering in the afterlife, tries to clarify the ontological nature of the universe to Charon. He first uses Aristotelian, then Neoplatonic conceptions about causes and forms. Charon responds philosophers only render incomprehensible what is otherwise well-known (Alberti 2003b, 304–305).

This play with verbal allegory is not simply subversive in an antiphilosophical sense, but it is deeply philosophical in its own right. Its meaning becomes clear through the exchanges that the novel undertakes with the humanist tradition. The god Momus personifies this ludic seriousness. He is an alter-Prometheus, chased from the heavens on account of his rebellious nature. Landing in Tuscany, he does not create humanity or

provide them the sublime fire of intelligence but instead teaches women to disguise themselves, and show other faces, through the use of cosmetics. In one moment of crisis, the goddess Virtue lends him her veil, allowing him to change his appearance at will. Returning to Olympus, he offends Juno, and she, along with other divinities, castrate and cast him from heaven and chain him, like the Titan, to a rock. Nymphs that had earlier consoled Prometheus lend him aid. Momus persuades these nymphs to spread his black cloud of sighs across the sky and thereby conceal the earth from the vision of the gods.

The novel therefore treats with adroit gamesmanship the humanist Neoplatonic ontology. Momus is a walking, mutable allegory: deceit personified, he may present the face of virtue, while teaching others to dissemble. His divine, puckish element interferes with participation of the heavens in the earthly spectacle. At the novel’s close, humanity stages a performance in the gods’ honor and rings the theatre with their statues. Jupiter and the other deities, whom Momus’s cloud blocks from seeing the earthly spectacle, descend to earth and take the place of their own likenesses. As a result, they are abused by drunks and unruly passersby. One main performer in the spectacle is an actor-philosopher named Oenops (Tipsy). Held prisoner in a cave by thieves, Oenops escapes torture thanks to the statue of Stupor, since the criminals, using torches, are frightened by its sight.

The cave episode, with its Platonic parody, illustrates the confusion among the mortals and the gods. This confusion extends itself to the earthly theater, which is also shrouded in darkness. Statues are mistaken for deities, and the deities, in the theater, are misunderstood as statues. Humanist allegorizing therefore only seems grounded in ontological sureties. In either domain, within or without the cave, earth or heaven, the gods remain hidden. Mortals are left in insecurity and largely focused, like the philosopher Gelastus, on their passage from this world to the next, without clear divine guidance. Apollo, the narrator states, is in love with the goddess Shadow (Umbra), the daughter of Night. Night steals Apollo’s prophecies and hides them in her

statue; in the nocturnal chaos, the prophecies are found by Ambiguity (Ambago).

Night, Shadow, Ambiguity: these deities alter Apollo's insights, or at least the way he communicates them. A reader of Boccaccio, Alberti would have understood Night to be the mother of Deceit (Dolus) and Fraud (Fraus), close relations to Momus. Thus does divinity, as it does for Cusa, partake in obscurity and conceal itself from view. The gods wear disguises, so that it is difficult to discern their role in shaping or founding the reality that people experience. Humanity encounters divinity in the world, which is an arena of unstable, fluctuating interchange, imbued with transience. The philosophical task for Alberti and Cusa is to illuminate this arena as a playground where masks may have meaning, if only in the fundamental sense that meaning is masked. The human experience is one of time-bound, mortal movement.

The contrasting fifteenth-century humanist ontologies left their mark in the early modern period. Cassirer and Garin have stressed how humanists such as Pico and Ficino advanced notions of proto-Cartesian ideas of subjectivity and objectivity, based on the ontological security of knowledge. The Cartesian *cogito* relies on the superiority of the *ratio*, which, for many humanists, has its foundation in the divine mind as the source of Being. With regard to the more reserved strains of Valla, Cusanus, and Alberti, both Martin Luther (1483–1546) and Montaigne elaborated them, in differing ways. Luther cites Valla's support in his polemic against Erasmus over the bondage or freedom of the will. Human reason has no access to the qualities of God; it is a little torch, he writes elsewhere, compared to the divine mid-day sun. God conceals his mercy behind his anger, and his presence by his absence; he demands an experiential, rather than an intellectual engagement: "by living, indeed by dying and being damned does one become a theologian," Luther states, "not by knowing, reading, or speculating" (*Werke*, 1892, 5.163). Montaigne too emphasizes the presumption of rational speculation by both theologians and philosophers in his *Apologie de Raymond Sebond*. His accent is also on the

existential. Citing Plutarch, he affirms that "we have no communication with being, because all human nature is always midway between birth and death, offering only a dim appearance and shadow of itself" (Montaigne 1998, 2.434). While it is true, he says, that philosophy is like poetry, like a veiled image, he breaks with the hermeneutical confidence of Ficino and Pico. This image shines with many false lights, in order to exercise human conjecture. For no existing thing, either we ourselves or what we perceive, remains constant; everything flows and turns without rest. Aristotle is therefore correct to compare our vision of truth with the eye of the owl before the splendor of the sun; this light indicts mortal blindness. Our waking, he concludes, "is more asleep than sleep; our wisdom less wise than our foolishness" (Montaigne 1943, 427).

Returning to Michelangelo's statue of Night with its owl and mask in the Medici tombs, we can round these humanist philosophical reflections in this meditative space. Night, Boccaccio notes, is the parent of Old Age (Senectus) and Death (Mors). And, in his view, death is the ultimate terror, since Aristotle declared it an end; there seems to be nothing else for the dead (Boccaccio 2011, 1.28). In a religious setting, believers confront their fears soteriologically. They may find comfort in the sublime claims of ontological and epistemological securities, which fasten the world's wobbly transience to divine immutability and wisdom. The more concrete message of the Sacristy is that one is entering the grave of the princes. One communes with the dead and becomes aware of their presence in their absence. Time and history connect, yet also separate, the living from the dead, present from past lives. Humanists, in their endeavor to revive the past, awaken it from sleep, as they put it, walked through many tombs, and reconstructed communities from many ruins and remains. This imaginative enterprise was always mortal. By communing with the past, humanists could look over their own finitude. That humanists found their freedom in this finitude, even felt joy when bidding adieu, is one of their prime philosophical accomplishments.

Abstract

The following entry provides a brief overview of the concept known as “civic humanism” as popularized by Hans Baron’s 1955 book *The Crisis of the Early Italian Renaissance*. Baron’s hypothesis (often simply called the “Baron thesis”) described the union of humanist and republican values that characterized Florence in the early Quattrocento. The success of this synthesis, he stated, was the result of the profound impact the Florentine-Milanese conflict – culminating in the titular “crisis” – had on the Republic’s culture. Since its conception, many have followed in Baron’s footsteps by ascribing the modern virtue of active citizenship to this strand of humanism. Others have opposed the genesis, originality and accuracy of his presentation, discounting its academic worth and recasting Florentine humanism in their own image. Still, all in all, civic humanism has been one of the most influential notions in Renaissance historiography of the past century.

Heritage and Rupture: The Baron Thesis

When the German historian Hans Baron coined the term *Bürgerhumanismus* – usually translated as “civic humanism” – in 1925, he used it with reference to that particular coalescence of

Humanismus and *Bürgerbildung* that permeated the Florentine Republic in the time of two of its most notable chancellors, Coluccio Salutati (1374–1406) and his pupil Leonardo Bruni (1410–1411 and 1427–1444). This “civically marked” humanism of the Quattrocento, he wrote, was built on their classically inspired appreciation of the republic (“*eine lebendige Liebe zur heimischen Respublica*”) and remained prevalent until it was inevitably overcome by the “asocial” tendencies and political conditions that entailed the decay of the *Bürgerrepubliken* it championed (Baron 1925). Baron, much like Jacob Burckhardt before him, endorsed the view of the Renaissance as having brought about a major paradigm shift in Western thinking; but where Burckhardt had seen the emergence of humanism as that of individualism indiscriminately diffused throughout Italy, Baron’s work – similarly to that of Eugenio Garin – envisioned a particular significance for Florence and its republican nature (cf. Baron 1988).

The thesis thus advanced by Baron was part of his inquiry into “the roots and essence of humanism *tout court*,” as Riccardo Fubini points out, “including its Italian and Petrarchan origins and its ‘civic’ Florentine character,” an inquiry which he continued to develop in the following decades (Fubini 1992). It was the main focus of his 1955 *The Crisis of the Early Italian Renaissance*, subtitled *Civic Humanism and Republican Liberty in an Age of Classicism and Tyranny*, and often considered among the most important monographs in Renaissance historiography (cf. Hankins 1995, 2000b). In it, Baron expands on his notion of *Bürgerhumanismus*, tracing the “new type of civic culture” of early Quattrocento Florence back to a specific historical event – namely, the conclusion of the Florentine-Milanese conflict (Baron 1955). In the 1390s, Florence found itself increasingly embroiled in a struggle with the Visconti monarchy of the city-state Milan. Giangaleazzo, the Duke of Milan, came to be viewed as a political threat, one of impending tyranny antithetical to the Florentine tendency towards liberty. As the “never-ceasing expansion of the Milanese empire” grew to envelop many of the old city-states, Baron

explains, Florentines bore the burden of opposition as prime antagonists, further strengthening their tendency to fashion themselves as defenders of political freedom (Baron 1955). Finally, in 1402, when the battle seemed lost and Milanese troops were on the cusp of advancing into Florentine territory, no signal came: Giangaleazzo had succumbed to the plague. Expansion abruptly halted (at least for a time), the enemies he had subdued were quickly restored, and so the “crisis of the early Italian Renaissance” came to a head with a miraculous Florentine victory.

The new *Weltanschauung* of civic humanism was the offspring of this crisis, emerging triumphant in the wake of a decade of ideological warfare. Where previously, as with Petrarch and other “socially irresponsible men of letters” (Baron 1955), the blossoming of the *studiahumanitatis* had remained limited to a contemplative, scholarly context, the humanist circles that had experienced the outcome of the conflict immediately and decisively now felt inspired by the commonwealth’s civic ideals. As a result, notions of public service and popular government, reminiscent of the eternal values of the ancient world, began to circulate heavily among them. “To the humanists, Florence had become the city of freedom” (Rabil 1988b), and their patriotic devotion profoundly shaped their writing. Baron singles out Leonardo Bruni, whose works – the *Laudatio Florentinae Urbis* in particular, which Baron describes as “the most vigorous and most complete expression of the new complex of politico-historical ideas that arose during the struggle against Giangaleazzo” (Baron 1955) – codified, as it were, the new civic sentiment. The resulting “fusion [...] between the humanistic and the civic outlook” (Baron 1955), between “the models of antiquity” and the Republic’s “communal values” (Fubini 1992), although original to the conditions of the Florentine polity, would invariably change the course of the Renaissance as a whole. Indeed, it sowed the seeds of what Baron regards as the period’s lasting contribution to our modern ethos – a shift, that is, in the way in which the individual views himself in relation to his community. “From that time on,” he concludes, “there would exist a kind of Humanism which

endeavored to educate a man as a member of his society and state” (Baron 1955).

The ideology of civic humanism, then, reveals itself in a number of ways. Most obvious is the rejection of the *vita contemplativa* or *solitaria* in favor of the *vita activa* with its tendency towards political engagement; the reinterpretation and reappraisal of the civic qualities of the Roman Republic (qualities to which Florence would have been heir); as well as the defense of the popular vernacular and its literary value, as gleaned from works by Dante, Petrarch, and Boccaccio. But it should also be noted that this strand of humanism means the transformation of the Western tradition “by the layman’s spirit” (Baron 1955), or, to cite Garin, “the construction of an earthly city by man” (Garin 1952) – simply put, the positive revaluation of material existence. The acquisition of wealth began to be seen, “not as an impediment to knowledge and salvation, but instead as a resource to be used in the promotion of learning and morality” (Brucker 1969). This is not to say that the civic humanists unequivocally turned away from the teachings of Christianity – in fact, according to some, Baron’s approach entails a “fusion between the civic spirit and Christianity” that spelled the end of the glorification of paganism (Rabil 1988b); however, it does reveal their changed attitude towards Florentine culture in light of the commonwealth’s economic enterprises. It is this attitude that some scholars believe lies at the root of Western secularization (cf. Celenza 2015).

Impact and Legacy

The so-called “Baron thesis” proved hugely successful, offering a productive framework for those looking to investigate the role of civic idealism in the history of ideas. As a result, it has been eagerly adopted by many scholars and given rise to numerous studies aiming to expand the Baronian model or rectify its shortcomings, even as they stretch it to its limits. Notable among these is John G. A. Pocock, whose seminal *The Machiavellian Moment: Florentine Political Thought and the Atlantic Republican Tradition*, written 20 years

after Baron's *Crisis*, proposes to theorize the continued development of civic humanism beyond the Renaissance – how it “passed from Renaissance Florence to Oliver Cromwell's England, and thence to colonial America, where it formed the ideological matrix of the American Revolution” (Hankins 2000a). Thus, with Pocock, civic humanism becomes a distinct strand in political history, correspondent with that of “classical republicanism” (Pocock 1975); a strand which, as James Hankins explains, even “passed from the realm of scholarship to that of public policy, where, under the guise of ‘communitarianism,’ it became a rallying point for political theorists” in the 1980s and beyond (Hankins 2000a). Though in some respects distant from Baron's original interpretation, Pocock's civic humanism, centered around the democratic virtue of citizenship as the humanists' essential contribution to Western thinking, remains an authoritative (if controversial) concept in the history of ideas.

This does not mean Baron's findings have been wholly undisputed – on the contrary, as wholesale “Baronianism” has been largely superseded in modern academic discourse, so has the concept of civic humanism received its fair share of criticism (cf. Rabil 1988a; Witt 1996; Hankins 2000b; Baker and Maxson 2015). It would exceed the scope of the present entry to dwell on all such counternarratives; instead, a brief survey of the varying critical strategies will suffice. As John Najemy points out, opposition revolves around three main points of contention: “the genesis, the originality, and the accuracy of the civic humanist representation of republican politics in fifteenth-century Florence” (Najemy 2000). First of all, some have argued that Baron distorts the relationship between ideas and experience by interpreting extensive cultural changes as a sudden, singular response to a political crisis – it is more likely, they say, that the Florentine civic “revolution” was the gradual result of a number of circumstances (cf. Brucker 1969; Brucker 1977; Bloom 2004). Marvin Becker's “statist thesis,” for instance, identifies the establishment of the citizenry's *monte* of public debt as the catalyst for Baronian developments, emphasizing an internal rather than an external reality (Becker 1968).

The “internal” critique of Quentin Skinner is also well known in this regard: Skinner recognizes the medieval-scholastic precursors to Florentine humanism, thereby denying what Baron and Pocock view as its original Aristotelean nature (Skinner 1978; Skinner 1990; Hankins 2000a). Secondly, critics like Eugene Rice and Paul Oskar Kristeller have been quick to point out that the civic dimension of Italian humanism is but one facet of it, and that we would be mistaken in limiting our understanding of its influence on this Florentine strand in view of its monarchical and despotic vestiges (Rice 1958; Kristeller 1965). Kristeller's propositions in particular, departing from his view that the humanists were professional rhetoricians first and foremost, have found a good deal of proponents (Kristeller 1961, 1964, 1965). Andrea Gamberini likewise argued that civic humanism presents an idealized “crystallization,” which detracts from the “rich and varied elaborations of Florentine humanists” (Gamberini and Lazzarini 2012). Lastly, the very essence of Baron's reading of civic humanism has sparked much debate – certainly with Skinner and Kristeller, but also, for instance, with the “class thesis” of Lauro Martines, who affirms that the Florentine Republic was, in essence, an oligarchy and that the humanists' writings reflected this political reality (Martines 1963); and similarly with Najemy, who sees the civic humanists as ideologues buttressing the new hegemony in which the influence of the non-elite guildsmen was limited (Najemy 2000). More recently, Hester Schadee has analyzed Bruni's writings and made a convincing case for looking at his (Ciceronian) humanism in light of his commitment to a Florentine republican-aristocratic system (Schadee 2018). In short, in the century after they were originally stated, Baron's sweeping claims about the nature of Renaissance humanism have been addressed again and again, each rejoinder tuning the meaning of “civic humanism” to some degree and adapting it to fit a new perspective.

Be that as it may, we cannot underestimate the enduring legacy of the Baron thesis. Najemy's claim that it “has enjoyed (and suffered) a degree of attention and controversy that has not abated even now” is still valid, more than three decades

after Baron's death, "in a completely transformed world of historiographical assumptions and practices" (Najemy 2000). In spite of the immediate resistance it met with, Baron's hypothesis has persisted through its permutations to inspire countless scholars in tracing the origins, history, and development of Renaissance humanism. And even though the modern reader should heed to take some of his more outdated conclusions with the inevitable grain of salt, the understanding of civic humanism should help him to better grasp the writings of the Florentine humanists – as well as to appreciate the complex and multifaceted nature of the Renaissance as a whole.

Humours in Renaissance Philosophy

Malcolm Hebron
Winchester College, Winchester, UK

Abstract

The Renaissance inherited the classical doctrine of the four humours (Greek *chymoi*), the essential fluids of the human body. The

humours were blood, phlegm, yellow bile, and black bile. A healthy body was characterized by the balance between the humours. Illness was perceived as an interruption of that balance. The relative disposition of these four humours was believed to determine the physiological health and temperament of humans and animals. The humours formed part of a wider explanatory model of the natural world. They were connected to the four elements, the four temperaments, the four seasons, and the four ages of man. Each humour was governed by a particular bodily organ (Table 1).

Through this series of connections, the humours integrated the human body into a scheme of the wider natural world: in humoral theory, man is intrinsically a part of the natural order, not separate from it. The passions of the mind and aspects of character cannot be meaningfully understood apart from the physical body. Psychological as well as physical conditions are traceable to natural causes. As a materialist approach to diagnosis, humoral theory fits well with the Aristotelian tradition; Platonic interest in the spirit, and astrological and occult explanatory models of physical and emotional states, fall largely outside the theory of humourism (Arikha 2007).

Heritage and Rupture with the Tradition

Humoral theory can be traced back to pre-Socratic attempts to understand the fundamental nature of the universe. Detailed accounts of the humours are found in the writings of the Hippocratic corpus, ascribed to Hippocrates (c.460–c.370 BCE), such as *On the Nature of Man*. The theory is based on actual observation, before dissection was permitted. Under such conditions, the fluids taken in and secreted by the body were held to be of particular significance. It is possible that the notion of four humours comes from the appearance of blood clots. From Hippocratic medicine, humoral theory was transmitted through Rome, in particular in the work of Galen (129–c.200/216 CE), and Islamic medicine, into

Humours in Renaissance Philosophy, Table 1 Correspondences

Humour	Temperament	Element	Qualities	Age	Season	Organ
Blood	Sanguine	Air	Warm, moist	Infancy	Spring	Liver
Yellow bile	Choleric	Fire	Warm, dry	Youth	Summer	Spleen
Black bile	Melancholy	Earth	Dry, cold	Adulthood	Autumn	Gallbladder
Phlegm	Phlegmatic	Water	Cold, moist	Old age	Winter	Brain, lungs

the medieval and early modern periods (Conrad et al. 1995).

The theory has important theoretical implications. It presupposes that nature is susceptible to rational investigation, and that phenomena can be explained by natural causation, without reference to supernatural causes. In this way it fell easily into the Aristotelian tradition. Astrological and divine explanations were peripheral to humoristic analysis. Observation also established the principle that each case was different and required individual treatment. The doctrine of the humours is holistic: the microcosm of the human body is attuned to the macrocosm of the world. It presents mind and body as intrinsically linked, a distinctly pre-cartesian model of human nature. The ordering of the body’s internal mechanism is held to be a matter of restoring equilibrium, linking the humours with the inherited Pythagorean schema of balances and correspondences, which make an ordered structure running through nature. An example of such correspondences is the doctrine that an imbalance should be treated with its opposite: a hot fever should be treated with a cool substance, and so on. The purpose of treatment was always to return to the default equilibrium. A patient’s rebalancing had the purpose of restoring the body’s natural heat. This restoration could be assisted by other experiences inducing internal harmony, especially music. With proper exercise, the reason could regain control over disordered emotions (Siraisi 1990; Lindemann 2010).

Of particular interest to renaissance writers was the condition of melancholy, from the Greek for “black bile.” This was closely associated with creativity and inspiration. Montaigne’s essays follow the author’s desire to control a melancholy cast of mind and regain an internal balance through anatomizing his own consciousness. *The Treatise of Melancholie* (1586) by physician Timothy Bright

(c.1549–1615) is a useful guide to – and possible source for – the melancholic characters of Shakespeare. Later came the vast *Anatomy of Melancholy* (first edition 1621) by Robert Burton (1577–1640), the most compendious guide of the period not only to melancholy but also to the other humours and to the whole world of human emotion and thought, as perceived through disciplines including astronomy, astrology, and theology (Jackson 1978, 1986; Lyons 1971).

Impact and Legacy

While it underpinned orthodox medicine for centuries, the theory of the humours came under certain pressures. The Neoplatonists’ fascination with hermetic and magical writings revived an interest in occult, or hidden sources, of physical conditions. Marsilio Ficino’s *De vita* (1480–1489), for example, examines medicine alongside philosophy, magic, and astral influence. Ficino associates melancholy with the God Saturn and is concerned with the source of the *spiritus*, an idea not amenable to material diagnosis. A further problem for humoural thinking came from new diseases such as the English sweat, which did not seem to be explicable by traditional methods. Another point of tension was that between a determinist picture, according to which passions and character were a result of bodily conditions, and the Christian assertion of Free Will. Beyond medical and philosophical writings, the humours provided a valuable source of vocabulary and ideas for vernacular literature, such as the subgenre of “humours comedy,” represented by George Chapman *An Humorous Day’s Mirth* (1597), and Ben Jonson’s *Every Man in His Humour* (1598) and *Every Man Out of His Humour* (1599). A serious assault on the humours, and received medical

wisdom generally, was provided by Paracelsus (1493–1541), who countered, among other things, the notion that conditions should be treated by their opposites. While humoral theory has faded from Western diagnosis following the scientific revolution of the seventeenth century, there are certain parallels with Indian Ayurvedic and traditional Chinese medicine. Its legacy is evident in ordinary language: “complexion” originally referred to the compound of the four humours in an individual; the terms sanguine, splenetic, choleric, melancholic, and even-tempered are still used to describe behavioral types (Porter 1997).

Hus, Jan

Born: ca. 1372, Husinec, Southern Bohemia

Died: 6 July 1415, Constance, Baden-Württemberg

Ota Pavlíček

Institute of Philosophy, Czech Academy of Sciences, Prague, Czech Republic

Abstract

Although Jan Hus gained his reputation mainly as a Bohemian theologian and preacher who advocated for the reform of the late-medieval church, he was also a master and teacher at the Prague faculty of liberal arts. However, since his commentaries on Aristotle are not extant, we may understand his philosophical thought mainly through treatises from the field of philosophical theology, for example, from the first two books of his *Sentences* commentary. We may say on this basis that Hus’s philosophical thought was significantly influenced by John Wyclif’s realist philosophy and, at the same time, by the Augustinian and Platonic branches of Christian thought.

Biography

Jan Hus was born ca. 1372 in the village of Husinec near Prachatice in Southern Bohemia. By 1390 at the latest, he had enrolled in the faculty of arts at the University of Prague. With his enrolment at the university, he became a member of the Bohemian university nation, one of the four national corporations founded on the territorial origins of the masters and students. He became a bachelor of liberal arts in 1393 and a master in 1396.

After becoming a master, Hus taught at the faculty for 2 years to become a regular professor. Already in this period, he most probably belonged to a group of Bohemian students and masters who positively received some of the opinions of the English philosopher and theologian John Wyclif.

The reception of Wyclif's thought, who was condemned by the church as a heretic, marked significantly not only Hus's own doctrinal views but also his life. As a young master at the latest, Hus became thoroughly acquainted with Wyclif's realist philosophy. In 1398, he prepared a copy of Wyclif's treatises *De universalibus*, *De tempore*, *De ideis*, and *De materia et forma*. Around that time, Hus's pedagogical career started to develop promisingly. He was most probably a favored teacher, sought after by students. From 1398 until the end of his activities at the faculty of arts, he acted as the graduation officer for approximately thirty bachelors and masters. In 1401, he served as the dean of the faculty.

Around 1400, Hus was ordained priest and started to preach, while already studying at the faculty of theology in Prague. In 1404–1406, he prepared a commentary on the seven canonical epistles and, subsequently, an exegesis of Psalms 109–118. In 1407 he became a *baccalarius sententiaris* and started to comment on Peter Lombard's *Sentences*, finishing his commentary in 1409.

Hus's appointment as a preacher in the Bethlehem chapel in Prague in 1402 was a crucial moment in his life. This chapel, in which the preacher was obliged to preach in the Czech language, was the center of the Bohemian church reform movement and became Hus's home for approximately 10 years. Thanks to his intensive preaching activity in vernacular at this place, which could accommodate up to three thousand people, Hus became an influential preacher in Prague. He also composed several treatises in Czech, although he wrote the majority of his *opera* in Latin.

Until 1408, the reform group of Prague masters could rely on the support of the Archbishop of Prague, Zbyněk of Házmburg. However, because of the complaints of the German masters of the University of Prague at the papal curia, Zbyněk began, in 1408, to proceed strongly against the positive reception of Wyclif's opinions at the University of Prague. At the same time, Stanislav of Znojmo, the leading figure of the reform masters, was forced to leave Prague for Italy, to defend himself at the curia against the claims that he,

like Wyclif, held the doctrine of Eucharistic remanence. On the journey, he was accompanied by Stephen of Pálež, another important master. In consequence, Jan Hus found himself foremost in the reform movement and in the center of the struggles concerning Wyclif's thought in Prague.

Jan Hus supported the change of the ratio of votes among the four university nations at the University of Prague in favor of the Bohemian nation, which was decreed by King Wenceslas IV at Kutná Hora in January 1409. Hus became the first rector of the university elected under the new rules and continued his resistance to the archbishop's bans on studying Wyclif's treatises, measures which escalated in 1410 and were, to a significant degree, supported by papal bulls. The archbishop ordered all manuscripts containing Wyclif's treatises burned, which led to further protests from the party around Hus. The latter defended the reading of Wyclif's works in the treatise *De libris haereticorum legendis*. According to Hus, it should be permitted to own and read books full of truths, even if they also contain heretical elements. He based much of his argument on the notion that, if treated like Wyclif's works, the treatises of Aristotle, Averroes, Lombard, and other books including the Old Testament would have to be condemned and burned as well.

At the same time, Hus decided to appeal against the papal bull that supported the archbishop's bans imposed on Wyclif's treatises. Hus's appeal was a crucial moment in his life, since with this step he himself brought the dispute to the curia and connected it to his name. Thus, one of the consequences of the appeal was the beginning of legal proceedings by the Church against the Prague theologian, which in 1412 led to his excommunication, for not appearing before the curia, and his subsequent withdrawal from Prague. At this time, his ecclesiological opinions began to radicalize and their reform character became more pronounced, being significantly influenced by Wyclif's thought. Especially noteworthy is Hus's treatise *De ecclesia*. One of the signs of the radicalization of Hus's thought, his deep faith, and, at the same time, his distrust of ecclesiastical justice is Hus's appeal to Christ

against the excommunication and his emphasis on the authority of the Divine law in opposition to the authority of the earthly church. Both these points are characteristic of Hus's defiance of the church hierarchy.

Hus decided to defend his opinions before the Council of Constance to which he was invited by the protector of the council, the Roman King Sigismund. The latter provided Hus with a safe-conduct, which was to guarantee a safe passage to the council and back to Bohemia. Hus most probably expected that he would be allowed to clarify his standpoints in an academic disputation before the council. However, instead of such a discussion, Hus was put into prison, and the legal proceedings against him, begun in 1410, continued at the council. Hus was suspected of Wycliffite heresy and could either recant opinions, including ideas that he never held, or decide not to recant and be condemned to death. Since such a recantation was not in conformity with his faith and conscience, he decided not to recant and was condemned as a heretic and burned at the stake on the bank of Rhine on 6 July 1415.

Philosophy

Although Hus's commentaries on Aristotle's treatises are not extant, we know thanks to medieval library catalogs that Hus taught at the faculty of arts at least Aristotle's *Physics*, *Metaphysics*, *On Soul*, and *On Generation and Corruption*. He also prepared a commentary on the *ars vetus* which included in Prague and elsewhere Porphyry's Introduction to Aristotle's *Categories*, Gilbert de la Porrée's *Book of Six Principles*, Boethius's *Book on Division*, and Aristotle's *On Interpretation*. Hus might also have prepared an extant commentary on Albert of Orlamünde's *Summa naturalium*. His authorship, however, is not securely proved.

It follows from the current state of knowledge that a study of Hus's philosophical thought in the proper sense has to rely mainly on his treatises from the field of philosophical theology. These include Hus's *Sentences* commentary and shorter individual texts, more precisely *Quaestio de*

testimonio fidei christianae, *Quaestio de effectu indesinibili*, *Quaestio de vera felicitate*, *Quaestio de materia prima*, and *Quaestio de optima dispositione universi*. Hus prepared the last *quaestio* as the principal *quaestio* for a quodlibetal disputation over which he presided at the faculty of arts in 1411. As the presiding master, he composed an extensive handbook for the disputation, which testifies to his philosophical erudition.

We may recognize in the abovementioned treatises several philosophical topics which are connected by the theme of universals and theology of creation. These include Divine ideas, first matter and being, the topic of genera and species, and the topic of God understood as a universal.

Hus was a proponent of a multitude of ideas in the Divine mind, understood as universals *ante rem* or *in causando*. In his view, the ideas are caused by God as necessarily as the Divine Persons. The ideas are eternal and as a whole correspond to the archetypal world in which they are distinguished from each other as causes of all created and creatable entities. Hus defines the archetypal world as the eternal intelligible model of the created world. This model represents the exemplary disposition of the universe which is present in the Divine mind. At the same time, the archetypal world is a precondition for a rational organization of the created universe. Since the latter is based on the optimal organization in the Divine mind, it is also organized optimally.

According to Jan Hus, the first entity created outside of the Divine mind (*ad extra*) is the prime matter, which was created out of nothing (*ex nihilo*) and contains all creatable things in potentiality. Prime matter serves as the material principle for the production of entities in actual existence. In this actual state of being, matter is always joined by substantial and accidental forms. According to Hus, even God cannot create a corporeal material thing before creating the prime matter as the internal principle of any such thing. Prime matter corresponds also to the absolutely considered being (*esse absolute sumptum*), which is the most general effect that is essentially predicated on all other entities with the exception of God. In consequence, being is a transcendental which is essentially present in all created things.

At the same time, being is the first entity that depends by its essence on God. Since being does not cease to exist, it is in Hus's view to a certain degree eternal or, as Hus writes, perpetual.

As far as universals in the proper sense are concerned, that is, genera and species, in Hus's view they and the entities subordinated to them are essentially identical, the universals being really present in the singulars. For example, in "Socrates," which is a singular, is really present the genus "animal" and the species "man" which both belong to Socrates's quiddity. Individual humans are the universal "man" by participation in this universal and, therefore, share the same specific nature of man, although they represent different singular essences and are really distinct from each other. The universals really present in the subordinated singulars are distinct from the singulars only by means of formal distinction. It follows from Hus's treatises that this distinction is not of a virtual character only.

In a manner similar to Wyclif in his treatise *De universalibus*, Hus understood his own standpoint on the matter of universals as the middle way between two extreme opinions. According to Hus, some scholars say that singulars and their universals are completely the same things that do not differ. At the same time, there are other scholars who are persuaded about essential distinction and distinction by reason between singulars and their universals. The Prague scholar rejects both these possibilities and presents a compromise: while universals and their singulars are essentially the same singular thing, they differ by means of a formal distinction. Hus seems to have had no doubts about the reality of universals, as in one of his *quaestiones* he says that the existence of universals belongs to the subjects of Christian faith. Their existence is also testified by the biblical account of creation (Gen 1:21–25). Because of his realist standpoint, Hus could apply principles from his theory of universals to the Divine Essence and the Trinity of Divine Persons.

Hus's philosophical thought was significantly influenced by a part of John Wyclif's philosophical theology which was to an important extent based on a reinterpretation of several of

Augustine's treatises. In turn, Hus's philosophical theology shows an important Augustinian influence and a more general Christian Platonic influence. Although Hus adopted many philosophical ideas from Wyclif, the Prague theologian limited some of Wyclif's more controversial opinions and sometimes freed them from heterodox theological consequences. Hus's realist philosophy was of limited importance in the context of his whole opus. More important was his theological and reformist thought, which ushered in not only the Hussite movement and the Bohemian Utraquist Reformation but also the German Protestant Reformation, which to a certain degree links to Hus's efforts.

Hydrostatics in Renaissance Sciences

Paolo Cavagnero
Department of Environment, Land and
Infrastructure Engineering, Politecnico di Torino,
Turin, Italy

Abstract

Renaissance hydrostatics developed almost independently from other fields of mechanics. Throughout the Middle Ages and early

Renaissance, only the main results of Archimedes' fundamental work *On Floating Bodies* were known and substantially accepted, with no attention to their theoretical foundations. The gradual rediscovery of Archimedean texts (through apocryphal texts and Latin translations) gave new life to the speculations on the equilibrium of fluids and the laws of flotation. A key figure in Renaissance hydrostatics is Leonardo da Vinci. Although he never accessed Archimedes' treatise, some Archimedean notions can be found in his manuscripts, where a qualitative approach to hydraulic problems led him to a sort of mechanical demonstration of the distribution of hydrostatic pressure on a vertical surface. It was only after the publication of print editions of Archimedes' work that hydrostatics found a new and more sound theoretical framework, with the work of Simon Stevin. His rejection of perpetual motion and the hypothesis of a water "stiffening", which does not affect equilibrium within the liquid body allowed him to generalize Archimedes' law of flotation, demonstrate the hydraulic paradox, and formulate the basic law which describes hydrostatic pressure on a submerged surface.

Heritage and Rupture with the Tradition

While hydrodynamics arose in the seventeenth century as a branch of general mechanics, hydrostatics developed during Renaissance almost entirely in an independent way, without explicit connections with other fields of contemporary mechanics, such as the statics of the rigid bodies, but with direct dependence on the Hellenistic Archimedean tradition (Fassò 1987).

Medieval natural philosophy inherited a vision of the physical world whose bases were set by Aristoteles in the treatise *On the Heavens*, dating from the fourteenth century BC (Clagett 1959).

As stated by Aristoteles, the four elements (earth, water, air, and fire) move according to their innate tendency to occupy their own natural place. The Aristotelian theory states that the natural place of earth and water is the bottom, so

these two elements move downward and are named “heavy.” The natural place of air and fire is instead the top, so they move upward and are designated as “light.” Earth is also considered to be heavier than water, as well as fire is considered to be lighter than air (Leggatt 1995). Aristoteles, however, did not suggest a univocal way for comparing the weights of two different bodies with respect to a common property (such as their volume). With reference to the problem of flotation, he also affirmed that flotation is easier for flat bodies than for edged ones, because it depends on the ability of the body to divide water and penetrate it and that a given body floats more easily in large than in small quantities of water (Arredi 1943; Fassò 1987).

The most likely cause of the main rupture with the Aristotelian tradition in the field of Renaissance hydrostatics has to be found in a Latin text that began to circulate in Europe between the twelfth and the thirteenth centuries under the title *Liber Archimedis de insidentibus in humidum* (*Archimedean book of what lie on water*), which was derived from Greek sources ascribable to Archimedes via Arab translations and integrations (Clagett and Moody 1960).

First of all, the book explicitly introduced a concept similar to the present concept of specific weight. Within the *Insidentibus in humidum*, the specific weight of a body (*gravitas secundum speciem*) is clearly defined with respect to a reference volume, while the total weight of the same body (*gravitas secundum numerositatem*) refers to its actual size. Secondly, the treatise contained excerpts from Proposition V of the Book I of the authentic *On Floating Bodies* by Archimedes, which essentially stated that any floating object displaces its own weight of fluid. Last but not least, several passages of the *Insidentibus in humidum* affirmed, in contrast with Aristoteles, that a body is neither heavy nor light when it is surrounded by a substance made of the same element.

The authentic Archimedean tradition in hydrostatics began to spread in European Renaissance after the completion of the first Latin translation of the Archimedean treatise *On Floating Bodies*, which was accomplished at the papal court in

Viterbo by the Flemish monk William of Moerbeke in 1269. Moerbeke’s translation was made from two excellent Greek manuscripts (known as Codices A and B, now disappeared) that gather copies of some works of Archimedes, including *On Floating Bodies*. Some copies of Moerbeke’s work were made in the fourteenth century, but the book became more easily accessible only in 1503, when it was partially edited and printed for the first time by the Italian astrologer and mathematician Luca Gaurico. The translation of *On Floating Bodies*, however, appeared only in later printed editions, namely those edited by Niccolò Tartaglia (1543), Curzio Troiano (1564), and Federico Commandino (1565). Another translation into Latin from Codex A was made by the Italian humanist and mathematician Jacopo da Cremona in 1450. Thanks to German mathematician Johannes Regiomontanus, a reworked version of Jacopo da Cremona’s translation found its way to Germany in 1468. This last book was also the nucleus of the first complete printed collection of the Greek and Latin versions of all Archimedes’ works, the so-called *editio princeps*.

Innovative and Original Aspects

Renaissance hydrostatics, as a consequence, directly sprouted from Archimedes’ results on buoyancy. As pointed out by Arredi, however, Archimedes’ final statement was generally known and accepted during the Middle Ages and in the early Renaissance, but the approach followed by him to get the result, and in particular, his idea of pressure, were systematically ignored (Nordon 1992).

Renaissance philosophy furthermore never took into consideration for a long time the cause of buoyancy, which Archimedes instead identifies with a lift force whose intensity equals precisely the weight of the water displaced by a floating body.

The definition of this force is the celebrated so-called Archimedes’ “principle,” even if, according to Costantino Fassò, it should be called

“theorem” rather than “principle” as Archimedes actually gave a proof of it (Fassò 1987).

Together with the reception of the Archimedean tradition, traces of the Aristotelian mistake of easier flotation of flat bodies can still be found in the fifteenth century in Nicholas of Cusa (Arredi 1943; Fassò 1987). This seems rather strange for a philosopher who is considered to have been the first to lay strong emphasis on the quantitative approach to problems in physics and medicine, based upon extensive use of measurements. A pioneering idea, which represents a remarkable step in the origin of Renaissance science. It is not by chance that Nicholas’ works were known to Leonardo da Vinci, who also directly tried to get hold of two copies of *On Floating Bodies*, probably related to the Latin translations by Moerbeke and Jacopo da Cremona (Duhem 1906–1909; Clagett 1969), as revealed by two notes dating from 1500 to 1502 on folio 968 recto of the Codex Atlanticus and on folio 2 recto of the Manuscript L (Marinoni 1973–1980, Marinoni 1987–1990).

Most Renaissance historians, however, consider that Leonardo did not succeed in his attempt to directly access Archimedes’ masterpiece on hydrostatics. Only one note on folios 413 recto and verso of the Codex Atlanticus quotes indeed a fragment from the Book II of *On Floating Bodies* in the Moerbeke’s translation, but it is not in Leonardo’s handwriting (Pedretti 1978). Leonardo moreover never refers to the force that water exerts on a submerged body using sentences that are identical or equivalent to the Archimedean definition (Fassò 1997). As a consequence, Leonardo probably gets in touch with the Archimedean tradition only through direct or indirect access to the contents of the *De insidentibus in humidum*, a text that is easily available during his lifetime.

Leonardo is, however, a remarkable figure in Renaissance hydrostatics. Although his voluminous notes on the equilibrium of fluids show that in this regard, as in many others, his considerations were mainly qualitative (he made no use of mathematical techniques to buttress his insights), he should be seen primarily as an inspirational transitional figure and as one of the first to

attach importance to “scientific observation” (Devreese and Vanden Berghe 2008). By means of measurements as well as ideal and actual experiments, Leonardo’s theory of weight indeed extends, or at least reinterprets, the Aristotelian concepts of absolute heaviness and lightness in the light of pseudo-Archimedean notions, thus grasping the concepts of specific bodies and neutral buoyancy (Cavagnero and Revelli 2014).

As a technician and an engineer, Leonardo also faced problems that now we relate to the nature of hydrostatic pressure, and his notes give us interesting insights into his original speculations on this subject (Gille 1964). In folio 6 recto of the Codex Leicester, Leonardo wondered about the magnitude of the action that water exerts on a vertical structure, in order to build banks and levees that are strong enough to prevent collapse. Leonardo identified the “level” of water as the only parameter that affects the intensity of water’s action. Water indeed “pushes in the height of the bank, from the surface to the bottom, with varying power”, and this “variation” is actually “caused by the difference, or inequality, of water height [from point to point]” (Pedretti 1987).

As a consequence, since Leonardo correctly deduced that “water gains degrees of power in each degree of its depth”, the bank as well must “increase its resistance from its top to its bottom”, so that the “resistance” of the bank equals the “power” of water. Leonardo did not develop any calculation technique to theoretically determine how the “power” exerted by water varies, but on the same folio 6 recto of the Codex Leicester he sketched one of his most original instruments for measuring the “inequality of this power.”

The instrument is a tank with a wall replaced by a flexible parchment, which is externally supported by some rigid horizontal bands. Each band is kept “in contact with the front edge of the container” by a pair of counterbalancing weights of increasing magnitude, whose sum equals the total “power” acting on the wall. With such an instrument, Leonardo not only could measure the magnitude of the whole action that water exerts on the wall. He indeed could even evaluate the magnitude and distribution of all the actions that water exerts on every single band which compose the

wall. And although these actions, and their resultant as well, are actually forces, it is clear that by performing such a mechanical discretization Leonardo came very close, for the first time in the modern era, to the present representation of the triangular distribution of hydrostatic pressure on a vertical wall (Macagno 1987). So close that the mathematical construction used in 1586 by Simon Stevin in the *De Beghinselen des Waterwichts* (*Principles on the weight of water*) to determine the pressure exerted by water on a vertical surface is conceptually identical to the mechanical one depicted by Leonardo on Codex Leicester.

With reference to the cause of buoyancy, the Venetian mathematician Giovanni Battista Benedetti was one of the first Renaissance scientists to have a clear understanding of the upward force to which an object submerged in water is subject, as described by Archimedes. It was only with the publication of *De Beghinselen des Waterwichts* by the Flemish mathematician and physicist Simon Stevin, however, that a complete theory of the floating bodies and the equilibrium of liquids was formulated. Stevin was the first to make any actual headway in hydrostatics since the time of Archimedes, and indeed he was one of the first to read Archimedes' work in the Latin translation, which as mentioned before was not generally available before the end of the fifteenth century (Dijksterhuis 1987).

Stevin reformulated and further developed hydrostatics introducing two new axioms, different from Archimedes' ones, as starting points:

1. The impossibility of perpetual motion.
2. The new concept of imaginatively "stiffening" a portion of the water volume. This "stiffening" does not affect the equilibrium.

Stevin's contribution to hydrostatics led to a number of important results, the most significant among them was the demonstration of what today we call the "hydrostatic paradox," according to which any quantity of liquid, however small, may be made to support any weight, however large (Devreese and Vanden Berghe 2008).

Another remarkable result of Stevin's approach to hydrostatics was the demonstration

and generalization of Archimedes' principle; using his words from the Proposition 8 of *De Beghinselen des Waterwichts*: "the gravity of any solid body is as much lighter in water than in air as is the gravity of the water having the same volume". According to Ernst Mach, Stevin gave a more satisfactory derivation of Archimedes' principle than that of the Syracusan himself (Mach 1897).

Last but not least, the abovementioned description of the thought experiment by which Stevin calculated the force that a liquid at rest exerts on the bottom and walls of the vessel that contains it led him, together with the hydrostatic paradox, to derive the fundamental law which is nowadays named after Stevin himself: the force exerted by a liquid on a surface of an arbitrary shape and an arbitrary degree of submersion or incline depends only on the area of this surface and the depth of its immersion, not on the volume of the liquid in the vessel.

Impact and Legacy

It is possible to identify two lines in the historical development of hydrostatics after Stevin and in early modern era (Devreese and Vanden Berghe 2008):

1. The Archimedean-Stevian theory, based on postulates specially developed for hydrostatics. Some of the axioms Stevin introduced were different from those of Archimedes, and they enabled him to push forward.
2. The method of Galileo and his school. This was an attempt to describe liquids using concepts from the mechanics of rigid bodies.

The first line, the approach of Archimedes and Stevin, gradually prevailed over the second. This was primarily due to the crucial role that the concept of pressure played in hydrostatics.

The hydrostatics developed by Galileo contained a rudimentary form of the principle of virtual velocity as a basic element and sought to borrow the principles of statics for applying them in hydrostatics. When Galileo studied dynamics

and analyzed water flowing down an incline, for example, he endeavored to adopt the laws that operate when a ball rolls down an incline. At a certain point, he perceived the importance of the fact that, whereas a lead ball may remain motionless on a horizontal surface, a liquid body cannot, because it flows apart. This proved difficult to incorporate into his description. The main reason for the inadequacy of the Galilean tradition was actually its lack of the crucial notion of “pressure” (Arredi 1943). The lack of the notion of “pressure” in the Galilean tradition limited the evolution of hydrostatics in Italy, even if Torricelli was able to make progress in liquid mechanics, deriving the law of efflux directly from classical Galilean mechanics (Munson 2002).

The concept of “pressure” in a liquid instead emerged quite naturally in the Archimedean-Stevian tradition, although pressure was known to Archimedes only indirectly. Stevin was the first to calculate the force exerted by a liquid on the walls or bottom of the vessel containing it. Without actually using the term “pressure” to describe it, that was, nonetheless, what he was calculating. The concept was elaborated later, first in the work of Pascal and Boyle, which built on Stevin’s theories of hydrostatics. The later works on fluid dynamics by Daniel Bernoulli and Leonard Euler, as well as all modern contributions to hydrostatics, are based on mathematical equations in which “pressure” is a key concept. In this sense, they continue the Archimedes-Stevin tradition.

Ibn Kaspi, Joseph

Born: 1280, Provence region, likely in Arles

Died: 1345, Majorca

Shalom Sadik

Ben Gurion University of the Negev, Be'er Scheva, Israel

Abstract

Josef Ibn Kaspi lived in Provence and traveled in Egypt, Majorca, Aragon, and Castile. He probably made his living through moneylending, with the help of his wife. He wrote more than 25 different books, the majority of which deal with Biblical exegesis, Hebrew grammar, and moral philosophy. He also wrote two commentaries on the *Guide of the Perplexed* and commentaries on Plato's *Republic* and Aristotle's *Ethics*. In terms of philosophy, R. Kaspi was a member of the Averroist trend in Jewish thought. As some other members of this school, R. Kaspi wrote in an "esoteric" way. Moreover, he seemingly contradicted himself on a number of subjects, making it difficult to elicit and understand his true philosophical positions.

Alternate Names

Kaspi, Joseph ben Abba Mari ben Joseph ben Jacob; Kaspi, Joseph; Caspi, Joseph

Biography

R. Kaspi was born in Provence in 1280, probably in Arles. His family name is a Hebraization of his family's ancestral town, Argentière, which was named for its ample silver mines; *kaspi* means *silvery* in Hebrew. R. Kaspi was known for his penchant for traveling. For example, he traveled in Egypt for 5 months between 1313 and 1314. The stated aim of this journey was to learn from the descendants of Maimonides some of the secrets of their illustrious ancestor. However, R. Kaspi found that the descendants of Maimonides were not well-versed in philosophy, and he returned to Provence. Kaspi also made two trips to Spain in the years 1330–1332 and took his last trip to Majorca in 1345, where he died shortly before his intended return to Provence.

Works

R. Kaspi wrote more than 25 works, most of which contained the word *kesef* (silver) in their title, an allusion to his family name. R. Kaspi's works can be divided into five major categories:

- I. Commentary on the Bible. Most of the writings of R. Kaspi are on this subject. In the case of two Biblical books (Proverbs and Job), he composed two commentaries. He wrote the *Matzref le-Kesef* (*Crucible for Silver*), which is a commentary on the Pentateuch, and the *Tirat Kesef* (*Palace of Silver*), which addresses specific questions in the interpretation of the Pentateuch. He wrote also a number of books on a number of important Biblical passages, for example, the *Menorat Kesef* (*Candelabra of Silver*), which interprets the vision of the chariot (Rock 2007).
- II. Books that address theoretical questions related to the exegesis of the Bible. For example, the *Shulchan Kesef* (*Table of Silver*) and *Gevia' ha-Kesef* (1982) (*Mug of Silver*), which also touch on the debate with Christianity.
- III. Books that focus on certain specific topics, such as *Tam ha-Kesef* (*The Silver is finished*), a collection of eight essays on different issues, and his book on ethics, *Sefer Hamusar* (*Book of Morality*).
- IV. Philosophical commentaries. Two commentaries on Maimonides' *Guide of the Perplexed* (*Amudei Kesef* (*Pillars of Silver*) and *Maskiyot Kesef* (*Images of Silver*)), a commentary on Maimonides' *Milot ha-Higayon* (*Logical tractate*) and a summary as well as commentary on Aristotle's *Ethics* and Plato's *Republic* according to the commentaries of Averroes on these books (Ibn Kaspi 2016) (*Oblation of Silver*).
- V. Works on Grammar: *Retuqot Kesef* and *Shasherot Kesef* on Biblical lexicography.

Main Philosophical Opinions

In most, R. Kaspi appears as a representative of the Averroist school of thought. For instance, he held a completely naturalistic opinion, though this only becomes apparent after we go beyond the exoterical sentences that he used to conceal his true opinions. The originality of R. Kaspi lies mostly in his various commentaries on the Bible and in particular in his philosophical positions on

certain key issues, with his opinion on natural law being a particularly good example. According to R. Kaspi, there exists in principle some perfect natural law, which is to say the best law for all places and all times. However, due to the different practical circumstances faced by all people across the generations, this law cannot be the constitution of any particular historical state. All societies have some practical considerations that affect the conduct of the population and thus interfere with implementing the perfect law in each society's legislation. For R. Kaspi, even the Law of Moses diverges from the perfect natural law, initially because of the influence of the then surrounding cultures on the Jews when they first came up out of Egypt and later due to the changing situation over the course of Jewish history. The dialectic between the ideal and the reality is the reason that the Law of Moses had to evolve. Nevertheless, these adjustments have to be hidden from the common people, in Kaspi's opinion, for if the masses were to understand that the Law of Moses constantly adjusts to circumstances, they would opt to change the law according to their corporeal temptations. This is the reason that Moses wrote in the *Deteuronomie* (Chap. 4: 2), "Ye shall not add unto the word which I command you, neither shall ye diminish from it."

Ibn Khaldūn

Born: 27 May 1332, Tunis

Died: 17 March 1406, Cairo

Audrey Borowski

University of Oxford, Oxford, UK

Abstract

Along with Herodotus and Thucydides, Ibn Khaldūn is generally perceived as one of the founding fathers of the social sciences and historiography. He began his life deeply immersed in the political world of his time occupying various governmental posts before eventually withdrawing from public life and penning the work he is perhaps best remembered for, the *Muqqadimah*.

Biography

Along with Herodotus and Thucydides, Ibn Khaldūn is generally perceived as one of the founding fathers of the social sciences and historiography. He was born in a family of high civil servants in Tunis in 1332 and formally educated in theology, Islamic law, grammar, rhetoric, mathematics, and philosophy. He was deeply rooted in his Islamic background, holding several high governmental and diplomatic posts in the service of Muslim rulers across the Maghreb, Spain, Egypt, and Syria over the course of his life. He successfully acted as an advisor to the ruler, a public speaker, a judge of the Maliki rite, a teacher, a professor of jurisprudence, and even a prime minister. He negotiated with Pedro the Cruel of Spain in Sevilla (1365) and Tamerlane on the outskirts of Damascus (1400). He eventually withdrew from political life and left for Egypt where he

was a professor of jurisprudence and spent the rest of his life.

All of Ibn Khaldūn's attempts to guide his community, advise his leaders, and reshape society through a reformed ruler ended in failure. Ibn Khaldūn lived in precarious times when the Almohad Empire in North Africa and Muslim Spain were in decline and convulsed by interne-cine conflicts and rebellions. He regularly found himself at the mercy of the vicissitudes of his time as rulers rose and fell including being imprisoned or forced into exile. This period of turmoil provided him with unique insights in matters of state, political dynamics, and the motives of human action from which he would later draw to formulate his science of culture.

Albeit versed in Islamic philosophy Ibn Khaldūn was critical of the theoretical approaches of the philosophers, in particular of the Neoplatonic brand, whose speculations he felt confined themselves to the ideal and understood reason as all-encompassing. Political philosophy in itself and its promotion of the ideal state (*khilāfa*) were inadequate and needed to be complemented by the study of history. The latter, rather than metaphysics, would provide the concrete causes of Islamic decline.

Ibn Khaldūn's predecessors had merely skimmed the surface of historical events and had "over-looked its inner meaning," which "involves speculation and an attempt to get at the truth, subtle explanation of the causes and origins of existing things, and deep knowledge of the how and why of events" (Ibn Khaldūn 1980). Ibn Khaldūn exposed the weaknesses of traditional Islamic historiography with its "incentive for inventing" and set out to develop a new scientific method for distinguishing true from false or erroneous reports (*ḥadīth*).

History was concerned with the nature and causes of actual existence and should penetrate beyond appearances and help discern patterns and general laws. This new science of history would help investigate the nature and causes of culture and social dynamics as they were rather than how they ought to be. Ibn Khaldūn eventually compiled his meditations in his *Muqaddima*, the work he is today foremost remembered for and the

introduction to his great history of the Arabs and the Berbers, the *Kitāb al-ʿibar*, which was divided into a six further books. In this analysis which he penned in Algeria over the course of 4 years from 1375 onward, he came to the conclusion that “social phenomena seem to obey laws which, while not as absolute as those governing natural phenomena, are sufficiently constant to cause social events to follow regular and well-defined patterns and sequences” (Ibn Khaldūn 1980).

In the *Muqaddima*, Ibn Khaldūn expounded his essentially cyclical view of history and society which included the influence of the environment on social life, man’s basic needs and desires, the economical foundations of power, the forms of rule as well as its relation to religion, and the interconnectedness of material supply and demand. At the heart of Ibn Khaldūn’s analysis lay his study of the nature of society and social change. Human society, according to him, is similar to an organism with a life of its own and, as such, went through a cycle of conquest, growth, peak, and decline. For Ibn Khaldūn, there were two driving forces in human history in every civilization: *ʿasabiya* (sense of community) and *mulk* (state power). *ʿAsabiya* referred to “the affection a man feels for a brother or a neighbour when one of them is treated unjustly or killed” (Ibn Khaldūn 1980). This “group feeling” in particular played a key role in the rise and fall of kingdoms and dynasties and its weakening generally led to the collapse of civilizations.

In his analysis of society, which he called *ʿilm al-ʿumrān*, Ibn Khaldūn distinguished between primitive culture (*ʿumrān badawī*) and civilized culture (*ʿumrān hadarī*) or civilization (*hadāra*). Primitive culture satisfied man’s essential needs and was marked by the frugality of nomadic life as well as violence, courage, self-reliance, and a strong militant spirit of solidarity. Man’s desire for peace and security led him to cooperate with other men and eventually associate with others in society. Through the establishment of the state humans were able to move beyond mere survival, develop their rational abilities, and embrace a life of leisure and luxury. Once the state had achieved peace and prosperity, sciences, arts, and crafts flourished. Urban life however gradually led to

the erosion of tribal virtues and the concentration of power in the hands of an absolute leader whose reliance on mercenaries led to rising expenditure and taxes and resulted in the impoverishment of the population. Spiritual, moral, and intellectual decadence soon set in. The loss of *ʿasabiya* marked the demise of the state and its reversion to primitivism. The cycle had reached its end.

Ibn Verga, Solomon

Born: before 1492

Died: after 1530

Maurice Kriegel

École des Hautes Études en Sciences Sociales,
Paris, France

Abstract

Solomon Ibn Verga lived in Spain when the Jews were expelled in 1492, and lived apparently until around 1530. His only work, entitled in Hebrew *Shevet Yehudah* – variously rendered as “The Staff of Judah,” “The Scourge of Judah,” or “The tribe of Judah” – deals with the history of the Jews, especially in the late medieval period. The author provides specific historical data, but also brings dubious information, following the model employed in one of his works by the Spanish court preacher, Antonio de Guevara (c. 1480–1545). The work also features fictional dialogues and epistles. As such, it reflects the influence of Renaissance modes of writing and at the same time paves the way to Modern Hebrew literature. Ibn Verga develops a comprehensive doctrine of tolerance, disparages both Christian and Jewish popular beliefs, as well as learned theological concepts in the two religious traditions, in which he sees

flights of fancy: religions, he contends, “do not exist but with the imagination.” Having lived in Spain when the Inquisition was founded, he wishes Christians to become open to religious difference. He also thinks that some Jewish rites and beliefs inevitably foster hostility, and calls on Jews to abandon or transform them. He ponders the respective roles of providential and natural causes in history, and some of his ideas have been compared to those of Giambattista Vico (1668–1744).

Biography

Our information on Solomon Ibn Verga's life is scant. We know for sure that he served in different functions in the Jewish community in Castile in the years immediately preceding the expulsion of Jews from Spain in 1492. He was in Portugal in 1506, when a riot broke out in Lisbon against the Jews that had been forcibly converted 9 years earlier. A Hebrew document seems to indicate that he departed the following year for Flanders, but died on the way. Internal evidence in his (only) book, on the other side, manifests the strong influence of a work of the Spanish court preacher, Antonio de Guevara (c. 1480–1545), which was published only in 1529. It is likely that Ibn Verga lived until the 1530s, in circumstances unknown to us, and completed his *Shevet Yehudah* in his later years. His son, Yossef ibn Verga (died c. 1559), published the book, with some additions of his own, in Adrianople (Edirne) in 1554.

Legacy and Rupture with the Tradition

The Hebrew term *shevet* has different meanings, and the title of Ibn Verga's book, *Shevet Yehudah*, may be translated in a number of ways: “The Staff of Judah,” “The Scourge of Judah,” “The Tribe of Judah” (thus alluding, in this last case, to Spanish Jewry, which boasted of hailing from the royal tribe of Judah in Biblical Israel). These diverse renditions of the title point to the various goals that Ibn Verga pursued. He wanted, first of all, to provide information on the history of the Jews

after the loss of their state in Antiquity. His focus is on the circumstances of episodes of persecution and the reasons for the increasing hatred against the Jews in the Late Middle Ages. Although he built on some earlier lists of massacres and banishments, including one apparently drafted by one of his relatives, Ibn Verga evinces a kind of historical interest that, in the context of traditional Jewish culture, is quite new. Secondly, since he does not endorse the view that ascribed exile and persecution to the chastisement of an unfaithful people by divine providence, he seeks to find out the historical and sociological reasons why Jews were hated and sets forth a series of recommendations on how to defuse anti-Jewish sentiments. This line of thought led him to propound views, on a more general theological-philosophical level, that aimed at elucidating how “providence” and “nature” combined in the shaping of history. Finally, Ibn Verga presents his ideas in the garb of fictional dialogues and epistles: he emulates Renaissance secular modes of writing and has rightly been hailed as the founder of Modern Hebrew literature. He was not entirely successful in the integration of the materials respectively corresponding to his historical, literary, and philosophical purposes, and this may account for what seems to be the unfinished character of the work.

Innovative and Original Aspects

Ibn Verga made use of some of the characteristic notions and motifs of Jewish medieval thought, interlaced them with contemporary queries, as these last were discussed on the broader European intellectual scene, and thus bestowed a new significance on inherited questionings and assumptions. There is a “skeptical” moment in Moses Maimonides (c. 1138–1204), as to the possibility of certain knowledge about the “things in the heavens.” A number of Jewish philosophers had compared, in a perspective close to that represented by Averroism, the central beliefs and doctrines of the three monotheistic religions, seen as basically similar, and the teachings of Aristotle. Ibn Verga leveraged these

various themes to put forward a comprehensive doctrine of tolerance. He emphasizes the common core of the three religions by offering a version of the tale of the three rings, that he borrowed, directly or indirectly, from Giovanni Boccaccio (1313–1375) or one of the Italian parallel sources (and not, as some have suggested, from a text of inner Jewish provenance). He castigated both Christian and Jewish popular beliefs, but also learned theological concepts in the two religious traditions, in which he saw flights of fancy: religions, he said, “do not exist but with the imagination.” Having lived in Spain when the Inquisition was founded, he wanted Christians to become open to religious difference. He also thought that some Jewish rites and beliefs inevitably fostered hostility and called on Jews to abandon or transform them.

In likewise manner, Ibn Verga was familiar with the ideas of Maimonides, or some of the Jewish philosophers who saw themselves as being his disciples, as evidenced by his treatment of the historical reasons for the disappearance of the ancient Jewish state. Ibn Verga interlaced them with a new understanding of historical causation that he seems to have borrowed from both Jewish and non-Jewish sources. Moreover, he tried to evaluate the respective roles of providential and natural causes, and some have compared his views to those of Vico.

In his assessment of the hostility towards Jews, Ibn Verga does not view all non-Jews as equally anti-Jewish, and stated a sociologically differentiated view of the exposure to anti-Jewish sentiments. This is to a certain extent new, but at the same time his major distinction, between elites that are well-wishing and lower classes among which animosity towards Jews is particularly pronounced echoes a commonly held view among medieval Jews. It must be emphasized that Ibn Verga was not overconfident in the backing of those holding political power: he warned that in times of crisis authorities may not be willing to run the risk of being denounced as “accomplices” of the Jews if they take action to protect them against physical attacks. Ultimately, Jews have to secure the goodwill of the entire body politic of a given country and cannot content themselves with the aid and support of the rulers.

Impact and Legacy

Ibn Verga was widely read among Jews in the early modern period. Some Jewish thinkers or communal leaders paid attention to his message on the shaping of the relations between Jews and non-Jews or on the natural reading of history. His work was translated into Yiddish for the benefit of those in the Jewish communities who had no Hebrew education, and in such a way that the more traditional features of Ibn Verga's thought and sensitivity were emphasized. It was also translated into Spanish and Latin. Early modern Christian writers on Jews borrow rather extensively from the *Shevet Yehudah*. The overall importance of Ibn Verga's book is that it constitutes a major link between two movements of "Jewish Enlightenment," the first in the medieval period and the second in the eighteenth and nineteenth centuries.

Iconoclasm, Renaissance

Virginia C. Raguin

Emerita, College of the Holy Cross, Worcester, MA, USA

Abstract

Iconoclasm, literally "image breaking," can be defined as the calculated destruction of imagery most commonly associated with religious belief (Boldrick et al. 2014). All religions show visible manifestations of belief; each is a part of a social system enabling adherents to recognize their coreligionists by dress, action, or physical location. Most religions have produced artifacts, frequently images, for use in ritual or in instruction. In paganism, gods were often anthropomorphized and manifested in human form. Christianity, a religion the core belief of which is the incarnation of god in flesh, views its founder as both fully human and fully divine. Christ's image eventually dominated worship. The beginnings of the religion, however, favored the monogram and the symbol as an antithesis to the Roman reliance on images in imperial propaganda as well as worship. By the fourth century, with toleration of the religion under Constantine, Christian imagery greatly developed (St. John Damascene). By the eighth century, the practice was questioned, especially in the Byzantine

Empire (Bryer and Herrin 1977; Brubaker and Haldon 2001). Despite varying positions on the value of imagery, such as the twelfth-century repudiation of monastic use of the image by Bernard of Clairvaux, the employment of sculpture and painting in the service of faith was only seriously challenged in the West during the Reformation. Calvinists in Switzerland and the Low Countries and Lutherans in Germany and Sweden adopted a purged religious service accompanied by an absence of imagery. England, while retaining at first a worship structure close to Catholicism, radically changed the appearance of the Protestant religion, marginalizing imagery. Frequently violent campaigns of destruction accompanied these changes.

Heritage and Rupture with the Tradition

Damnatio memoriae, the condemnation of memory, was a recognized aspect of Roman politics when, after death, an individual's name and image was erased from public view. Destruction of cultural monuments, frequently seen in modern wars of ethnic cleansing, can often include the targeted destruction of religious images. Recognizing such issues broadens the scope of iconoclasm well beyond its historical use. We see such contemporary complexity, however, in the Taliban's 2001 attack on the rock-cut images of the Buddha in Bamiyan.

The focus of this essay is restricted to the destruction of Christian images, most frequently by Christians with differing interpretation of the faith. Iconoclasm was first experienced in the Byzantine Empire from about 726 to 787. As with many cataclysmic events, the precise motivations are complex. Scholars have most often associated the decrees of the Emperor Leo III against images to the precedent set by the Umayyad Caliph Yazid II (720–724). Unusual for Muslim regimes in which tolerance of difference was more common, Yazid's attacks on Christian imagery were noted in both Christian and Islamic sources. By 750 Islam had extended its territory from Spain across Northern Africa,

through the Middle East, and to the eastern portion of present-day Turkey. This swift and spectacular success may have encouraged Byzantine rulers to search for reasons to explain God's displeasure. The Christian use of images was thus seen as needing reform. In 754 the Iconoclastic Council held in Constantinople declared:

Supported by the Holy Scriptures and the Fathers, we declare unanimously, in the name of the Holy Trinity, that there shall be rejected and removed and cursed out of the Christian Church every likeness which is made out of any material and colour whatever by the evil art of painters. Whoever in future dares to make such a thing, or to venerate it, or set it up in a church, or in a private house, or possesses it in secret, shall, if bishop, presbyter, or deacon, be deposed; if monk or layman, be anathematised, and become liable to be tried by the secular laws as an adversary of God and an enemy of the doctrines handed down by the Fathers. (*The Seven Ecumenical Councils of the Undivided Church* 1955, 543–545)

One of the best-known examples of monumental decoration from this time is found in the church of Hagia Eirene (Holy Peace) in Constantinople. Constantine V (741–775) rebuilt the church after fire and earthquake damage to the early fourth-century building. Rather than the human image, the apse displays a simple black outline of a cross on a gold ground. A second wave of iconoclasm between 814 and 842 was initiated by the Emperor Leo V the Armenian, in all likelihood similarly motivated by Christian military failures (Brubaker and Haldon 2011). An image from the Chludov Psalter, executed shortly after 843, and the triumph of the iconodules (supporters of the veneration of religious icons), depicts John VII, the Patriarch of Constantinople, rubbing out an image of the face of Christ. In a fascinating development, subsequent users of the psalter attacked the face of John, so that its features are now effaced (Kitzinger 1954).

This kind of selective iconoclasm continued sporadically. It is an indication that viewers actually regarded images as maleficent and capable of causing harm. Destruction of earlier Christian imagery in Muslim lands often took the form of scratching out eyes. Numerous surviving images, especially in wall paintings, show destruction focused on the eyes. Examples are found in the

frescoes in the rock-cut monasteries of Gorem (a UNESCO World Heritage Site) and in Constantinople's Church of Christ in Chora (Kariye Cami) of the early fourteenth century.

Iconoclasm in continental Europe reappeared during the sixteenth century with the progress of the Protestant Reformation. It was particularly virulent in the Low Countries and Switzerland where there was considerable disagreement within the Protestant camp. Martin Luther (1483–1546) condemned acts of destruction and at first welcomed images illustrating the Bible in his own translation and also for the decoration of church buildings. Andreas Carlstadt (1486–1541), teaching at Wittenberg and well-known to Luther, early condemned imagery. He articulated his reasons in *Von Abtuhung der Bilder* ("On the removal of imagery") of 1521: "That we keep images in church and in God's house is not right and [is] contrary to the First Commandment. . . Deceitful images murder all those who praise and pray to them" (Johnston and Scribner 1993, 82). In 1522 he persuaded Wittenberg's city's council to destroy statues and to whitewash wall paintings in churches. Iconoclastic fury spread rapidly with incidents in Zurich (1523), Geneva (1535), and Augsburg (1537). Indeed, moderates such as Ulrich Zwingli (1484–1531) were often pressed to advocate caution, seeking to have a regulated and orderly cleansing of the temple. Zwingli, however, also saw imagery as detrimental to faith: "Even if there were no divine command against idols, they have however led to a malformed abuse which should not be tolerated" (Johnston and Schribner, 1993, 85). John Calvin (1509–1564) was also sympathetic to cleansing the church of imagery.

The Low Countries and also France were soon embroiled (Crew 1978; Raguin 2010). As in Switzerland and Germany, protests against imagery were linked to political unrest. Frequently action by private individuals actually preceded exhortations by preachers (Wandel 1955). In 1555 Emperor Charles V transferred rule over the Netherlands to his son Philip II, an act that was seen as handing the country to a Catholic foreigner; and in the summer of 1566, the *Beeldenstorm* began: individuals stormed

churches and pulled down statues, a destruction captured by Franz Hogenburg's 1566 woodcut of the despoliation of the Church of Our Lady in Antwerp (Fig. 1). During the later sixteenth century, which saw the Wars of Religion in France, Huguenot Calvinists caused considerable destruction in churches such as the Cathedral of Auxerre, where they smashed the stained glass windows, reaching as high as they could with their staves.

From the earliest years of Henry VIII's break with Rome, the visible external manifestation of English otherness was the repudiation of devotional images (Gaimster and Gilchrist 2003). Instances of iconoclasm had appeared in both official and transgressive circumstances in England for some time; but the attention that the monarchy brought to this question demonstrates how crucial images became to national policy. Henry focused in 1538 on the image of the twelfth-century saint and martyr Thomas Becket; but all imagery was suspect, especially items associated with pilgrimages and indulgences. The Royal Injunctions cautioned that "feigned images" that are "abused with pilgrimages or offerings of anything made thereunto" must be taken down, and "henceforth no candles, tapers, or images of wax (*ex votos*) be set afore any image or picture" (Gee and Hardy 1896, 277–278). With the ascent of Henry's son Edward VI in 1547, iconoclastic reformers became more influential in official policies toward the visual appearance of the old religion. Royal injunctions were issued, one explicitly mandating reformers to "destroy all shrines . . . pictures, paintings and all other monuments of feigned miracles . . . so that there remain no memory of the same in walls, glass-windows, or elsewhere within their church or houses" (Injunction 28). Some houses have explicit records of destruction. Norwich, the center of the wool trade of East Anglia, was wealthy enough to destroy rather than whitewash windows. Faded whitewash remains on a fifteenth-century panel showing the symbol of the Trinity in the form of a shield (*scutum fidei*) now in the Walker Art Gallery, Liverpool.

During the reign of Elizabeth (1588–1603), whose own views were not iconoclastic,

Iconoclasm, Renaissance, Fig. 1 Franz Hogenberg, *The Calvinist Iconoclastic Riot of August 20, 1566* (Church of Our Lady, Antwerp), 1588, engraving, British Museum, London

moderation often prevailed. In 1561, however, she acquiesced to pressure and issued an order against any surviving crucifixes by demanding that rood lofts, also called choir screens, must be striped of images (Aston 1998, 312–313). John Fox published his *Book of Martyrs* in 1563, recording the suffering of Protestants at the hands of Catholics, which included a “well-cleansed” view of a church, images on a bonfire, and “papists packing away their paltry [on] the ship of the Romish Church.” Yet, outright destruction was discouraged. Indeed, many stained glass windows remain intact partially because of the expense of replacement. When repair was essential, however, the windows could then be replaced with clear glass, so that progressive decay was recognized as an efficient means of removing imagery (Duffy 1992; Raguin 2006).

There was considerable divergence in practice over time (Duffy 2001). One need only look at the deeply moving poetry of George Herbert (1593–1633), arguably a committed member of the Reformed Church as a Fellow of Trinity College, Cambridge, and Public Orator of the university for 7 years. In *The Temple*, published 1633, he praised the English Church, where “beauty . . . takes up her place.” Rome, too, had “long kissed her painted shrines,” while the iconoclastic Protestant church “wholly goes on th’ other side.” The poems are symbolically arranged as ecclesiastical ritual and church furnishings, including porch, altar, floor, tombs, music, lock and key, and particularly windows, where it is clear that he is speaking about storied windows. Man is but a “brittle crazie glasse,” who through the grace of God can “be a window.” Herbert

is referring to traditional kiln-fired, painted windows as he states: “But when thou (God) dost anneal in glasse thy storie, Making thy life to shine within” we are transformed. Herbert suggests that “colours and light . . . When they combine and mingle, bring Doctrine and life” more effectively than simple words that enter the ear but do “not conscience ring.”

Herbert’s verses reflect a brief revival, leading up to the so-called Laudian reform, under James I (r. 1625–1637), although Herbert is clearly distanced from contemporary clergy actually promoting restoration of Roman ties. William Laud became archbishop of Canterbury in 1633, and clergy who shared his views on the centrality of the sacraments and liturgy redecored many churches. Two artist brothers, Bernard and Abraham van Linge, natives of Emden, Holland, were active at this time. They supplied a number of windows, particularly in Oxford Colleges: Queens, 1635; Christ Church, c. 1635; Balliol, 1637; and University, 1641. A panel by Abraham van Linge showing the Deposition from Hampton Court, Herefordshire, displays both pot metal and white glass with enamel paints (Victoria & Albert Museum C.62-1927). It is signed and inscribed: “The truth hereof is historicall devine and not superstistious Anno Domini 1629.” The artist and his patron clearly wanted to distance themselves from any suggestion of popery or false religion (Phillips 1973).

During England’s Civil War and the Commonwealth (1640s–1660), vigorous elimination of imagery was again pursued, especially that recently installed by the Laudian movement (Aston 1998, 93). With the armed conflict, Oliver Cromwell’s troops often engaged in random acts of destruction. The taking of Peterborough resulted in the almost complete destruction of the windows of the cloister and the church of the cathedral. Later, possibly exaggerated, accounts speak of Cromwell himself getting a ladder and breaking a little image of the crucifixion he saw left over high up in the church loft. York was fortunate: when the town was captured by Puritan troops under Sir Thomas Fairfax in July 1644, the

Minster and parish churches were protected from destruction. Yet, more systematic campaigns were prevalent elsewhere. In 1643 laws mandated, again, the destruction of superstitious imagery, including crucifixes and pictures of the Virgin, the Holy Trinity, and the saints. William Dowsing left a journal of his vigorous breaking of windows and other forbidden items such as the inscriptions of sepulchral monuments of “pray for us.” Dowsing had been appointed Parliamentary Visitor entrusted with “demolishing the superstitious pictures and ornaments of churches &c.” in Cambridgeshire and Suffolk between 1643 and 1644. The entry for Clare, Suffolk, states: “We brake down a 1000 pictures superstitious and brake down 200, 3 of God the Father and 3 of Christ, and the Holy Lamb and here of the Holy Ghost like a dove with wings; and the 12 Apostles were carved in wood, on the top of the roof, which we gave order to have taken down; and twenty cherubims to be taken down . . .” (Dowsing 2001, 214).

Iconoclasm has reemerged in modern times in complex forms that included banning and also calculated destruction of images for secular as well as religious motivation. These include, among many manifestations, the National Socialist campaign against degenerate art (*entartete Kunst*), censorship of controversy imagery of a sexual nature, and Islamicist reactions to displays of image of Mohammed.

Ignatius Loyola

Born: ca. 23 October 1491, Onaz-Loyola (Spain)

Died: 31 July 1556, Rome (Italy)

A. Martínez Sobrino

Euskal Herriko Unibertsitatea, Universidad del País Vasco, UPV/EHU, Leioa, Spain

Abstract

Born in Onaz-Loyola (Spain) as the minor of the offspring of the Lord of Loyola, Ignatius led a warrior life until he got severely injured in the Battle of Pamplona (1521). After experiencing a call to religious life during the convalescence, he turned to a life of pilgrimage and service to God. After returning to Barcelona from his visit to the Holy Land (1523), he resumed the study of Grammar with his mind in obtaining the mastery in Philosophy and Theology. He attended the universities of Alcalá de Henares and of Paris. In Paris, he met the six people with whom he founded the Society of Jesus (1540). Appointed as the first Superior General of the order, he remained in Rome at the guiding of the Society until his death in 31 July 1556.

Alternate Names

Loiolakoa, Ignazio; de Loyola, Ignacio; de Loyola, Ignatius

Biography

Ignatius was born as Iñigo López de Loyola, though between 1537 and 1542, he changed it to Ignatius for he thought it would be better appreciated in France and Italy.

Ignatius was the youngest of 13 children born to Beltrán Ibáñez de Oñaz, Lord of Loyola, and Marina Sánchez de Licona. Both his parents died in a short time (1506–1507) before Ignatius turned 16. He becomes pageboy to Juan Velázquez de

Cuellar, major bookkeeper of the Kingdom or Kingdom Chancellor. Under the stewardship, Ignatius learnt to read and write, tasks on which he was very esteemed. In 1517, after Juan Velázquez's death, Ignatius was sent by the latter's widow to take up arms for the 2nd Duke of Nájera, Antonio Manrique de Lara. He fought safely in many battles until a French-Navarrese cannonball broke his right leg apart at the Battle of Pamplona in 1521. He was taken back severely injured to his birth house in Loyola, where, after undergoing several surgical operations, he recovered.

During the convalescence, Ignatius, who fancied books of Chivalry, ordered some, but, due to their lack, he was given religious books instead. He got so impressed by the life of Saints, specially by that of Ludolph of Saxony's *The Life of Christ* or *Vita Christi* (1470), that, after a period of inner struggling, he experienced a call to religious life. As soon as he was well recovered as to walk, February of 1522, he departed on a pilgrimage to Jerusalem. He first stopped at Montserrat (Barcelona) for a general confession and continued to Manresa (Catalonia) where he stayed for 11 months. In February of 1523, he returned back to Barcelona for embarking to Rome. After being received and blessed by Pope Adrian VI, he continued to Jerusalem, where he arrived on the 3rd September 1523. Twenty days later and against his will, he had to flee from the Holy Land. He headed to Barcelona to resume his grammar studies for entering the university. Once prepared, he moved to Alcalá de Henares where he studied Philosophy and Theology (March of 1526 until June of 1527). He decided to finish his formation in the best considered university of the time, so he moved to Paris, where he arrived on the 2nd February 1528. He stayed until the end of 1536 after obtaining a master degree from the University of Paris.

In Paris, he met Francis Xavier, Alfonso Salmeron, Diego Laynez, Nicholas Bobadilla, Peter Faber, and Simão Rodrigues, with whom, on the 15 August 1534, he pronounced the vows of poverty, chastity, and obedience giving rise to the *Societas Jesu* (Society of Jesus). In 1537, after realizing that it would be impossible for them to peregrinate to Jerusalem, the seven

headed to Rome for the approval of the Pope Paul III, who, in 1540, officially founded the Society of Jesus.

Ignatius, appointed the first Superior General of the order, lived from that moment on in Rome devoted to the ruling of the Society. He wrote together with Juan Alfonso de Polanco the Constitutions adopted by the Society in 1553. He ruled wisely and discreetly, heeding specially on the obedience, which he considered both a virtue and the main tool for the cohesion and efficacy of the Apostolate. Ignatius died in Rome on 31 July 1556.

He was beatified by Pope Paul V on 27 July 1609 and canonized by Pope Gregory XV on 12 March 1622. His feast day is celebrated annually on 31 July. Saint Ignatius is venerated as the patron saint of Catholic soldiers, the Military Ordinariate of the Philippines, the Roman Catholic Archdiocese of Baltimore, the Basque Country, Antwerp, Belo Horizonte, and Junin.

Images in Renaissance Science, Function of

Renzo Baldasso
Arizona State University, Tempe, AZ, USA

Abstract

Medieval natural philosophy proper, i.e., *philosophia naturalis*, was concerned with understanding natural motion and change, understood in the broadest forms; it was anchored primarily to Aristotle's *Physica*, *De caelo*, *De generatione et corruptione*, and *De animalibus*. These Aristotelian texts and their textual traditions did not relay on graphic arguments or visual representations. Over the course of the Renaissance, the intellectual and cultural boundaries, investigative domain, and methods of natural philosophy were transformed by the expansion of subalternated disciplines, including anatomy, botany, and mechanics. Because these disciplines made

extensive use of illustrations, the epistemic value of visual representation became important and images served both as representations of the evidence and as demonstrations. During the sixteenth century, a second factor that supported a new function for images in science developed from the philosophical controversy about the status of geometrical proofs and mathematical knowledge more generally, known as the *quaestio de certitudine mathematicarum*. The ground for the transformation of natural philosophy during the sixteenth century and the new role to be played by illustrations within it was prepared during the fifteenth century by the rise of what Alexandre Koyré called a *mentalité visuelle*. Specifically, technical drawings and the language of *disegno* acquired currency at court; graphic apparatus were devised for recently recovered and newly edited classical scientific treatises, as epitomized by Ptolemy's *Cosmographia*; finally, mathematical humanists made mathematical sciences fashionable for courtiers, at a time when the printing press canonized illustrations as text, contributing to shaping of a new intellectual culture.

Heritage and Rupture with the Tradition

Images and visual representation more generally had no role in medieval science proper. Experiments and observation of natural events were at best marginal to the methods of scholastic natural philosophy, an enterprise that was anchored on Aristotelian texts and their commentary traditions, and supported by verbal arguments based on logic. The discoveries about the natural world that came first from the explorations of new lands and environments and then from the heavens, which were relayed by images, did not challenge natural philosophers until the later sixteenth century. However, the transformation of the discipline, including the role of visual representation in it, began in the fifteenth century and it was prompted by the discovery of lost classical texts and the arrival of Greek manuscripts, both understood to be closer in format to the originals than

those extant in the scholastic Latin tradition. An important innovation for the methods of the discipline of logic came from Aristotelian logic texts brought to Italy by Byzantine emigres, which were filled with diagrams and graphic arguments; following the texts and teaching of scholars such as George of Trebizond, figures became common in logic. An earlier similar case is that of the *Geographia* by Ptolemy brought to Florence in 1397 by Manuel Chrysoloras: singlehandedly, this manuscript transformed the study of geography, rendering maps integral to this discipline and identifying visual representation as an essential dimension of classical science to be recovered by humanists. In their hunt for lost manuscripts, humanists found not only famous works such as *De rerum natura* by Lucretius and *De architectura* by Vitruvius – to mention only Poggio Bracciolini's most famous finds – but also texts such as *Atheni Atheniensis mathematici cum picturis instrumentorum* and *De machinis et instrumentis bellicis cum picture expressi*, which, even though they did not enter the canon of high learning, nonetheless had a substantial impact on how images came to be seen. These classical texts on engineering and machines, including chapter X of Vitruvius's *De architectura*, elevated the status of technical drawings: these were no longer simply the sketches used by engineers since the later middle ages to find and convey solutions in the context of architecture, ship building, and military sciences; they became fashionable means of communications between artists/engineers and their patrons and advisers, requiring these intellectuals and noblemen to become familiar with visual and graphic reasoning. Though at court they retained a more illustrative rather than exploratory nature, the circulation of technical drawings in high culture environments not only brought emphasis to their draftsmanship and ennobled the figure of the engineer – role played for instance by Filarete and Leonardo at the Milanese court – but also contributed to the currency of graphic representation as a form of knowing and a form of investigation of natural and artificial processes.

Leon Battista Alberti is one of the fifteenth-century humanists who argued for a solid

theoretical footing to the drawings and visual reasoning by developing and grounding in Euclidean geometry the notion of *disegno* – an umbrella term that encompasses both draftsmanship skills and the ability to reason by graphic means – a notion that will be enshrined as the father of all arts by Giorgio Vasari in the sixteenth century. As the figures in his own manuscript of Euclid's *Elements* suggest (Biblioteca Marciana, Lat. VII, 39, =3271), Alberti's commitment to the epistemic role of visual representation was certainly shaped by his study of geometric diagrams – the efforts of humanists to create correct figures for this text will continue into the sixteenth century and find an illustrious interpreter in Luca Pacioli. The conviction in the power of images and, specifically, of diagrams in science is epitomized by the publishing project undertaken by Johannes Regiomontanus, a friend of Alberti and a protégé of Cardinal Bessarion. In 1472, Regiomontanus became a printer in order to produce correct scientific texts inclusive of diagrams and figures embedded in the text block. His premature death in 1476 prevented the completion of his publishing program that included all major classical and modern scientific authors, from Archimedes, Euclid, and Pappus to Nicholas of Cusa, Puerbach, and Witelo. However, Regiomontanus's idea of printing mathematical and scientific texts with complete and high quality apparatus of figures found another interpreter in Erhard Ratdolt, who has been deemed the most inventive printer after Gutenberg. In 1482, he issued the *Elements*'s first edition in a large print run (likely exceeding 2,000 copies), with over 500 figures printed from type-high metal rule embedded in plaster, an innovative solution that also allowed the insertion of types for the letters. In his preface, Ratdolt makes several points about figures in mathematical and scientific texts worth noting: “[. . .] until now, no one has found a way to make the geometric figures that abound in these works and without which nothing in mathematics can be properly understood [. . .] and I hope that because of my contribution [i.e. the new method to print diagrams], soon the majority of books pertaining to the disciplines the Greeks call ‘mathemata’ as well as the rest of the sciences

Images in Renaissance Science, Function of, Fig. 1 Guidobaldo del Monte, *Mechanicorum Liber* (Pesaro: Hieronymus Concordia, 1577) pp. 106v–107r

will incorporate figures” (Dedicatory Letter to Doge Mocenico, Euclid 1482). His hopes did not materialize quickly, but in the sixteenth century, figures became common in scientific publications and essential tools for the study of the Book of Nature (Fig. 1).

Innovative and Original Aspects

Though growing in presence also in astronomical texts, it was in anatomical and botanical publications that scientific images came to a special prominence over the course of the sixteenth century. The acceptance of their new status is embodied by the question Leonhart Fuchs asked in the Preface of *De historia stirpium* (Paris, 1542): “Who in his right mind would condemn pictures which can communicate information much more clearly than the words of even the most eloquent men?” (Preface, x–xi). Notably, the notion of the

superiority of visual over verbal representation for the purpose of describing natural specimens was invoked already by the end of the fifteenth century, from among others by Leonardo who claimed that words, however eloquent, simply fail to represent a specimen for readers, making drawing and visual representation a necessary. The 518 remarkable woodcuts appearing in the 896 pages of *De historia stirpium* made Fuchs’s question seem rhetorical, but various writers did in fact questioned the value of illustrations, following in the footsteps of the ancients, including Pliny the Elder who had doomed the usefulness of images in science because, in addition to the challenge for scribes and illuminators to make accurate copies, book illustrations cannot reproduce the colors and capture only one state of the specimen’s appearance. Even though the illustrations of *De historia stirpium* and *De humani corporis fabrica* (1543) helped botany and anatomy gain prominence while strengthening the connection

between the role of visual representation and the observational/descriptive nature of these sciences, Andreas Vesalius made clear to his readers that the *Fabrica*'s illustrations were not to replace the experience of dissecting bodies, thus confirming also anatomical theaters together with the botanic gardens as important new learning environments. The very form of the images helped the arguments by Fuchs and Vesalius go beyond the descriptive dimension (*historia*) and become causal knowledge (*scientia*): their figures are not "photographic" or *ad vivum* representations, but they generalize the firsthand experience, editing the accidental components of the specimen-subject to ensure an ideal morphological description.

Impact and Legacy

Precisely the challenge of establishing causal, reason knowledge plagued the status and epistemological value of visual representation of natural specimens, a subject discussed extensively at the Accademia dei Lincei. Federico Cesi and other members recognized the value of images to make records of *esperienze* and anomalies, but they admitted their limits for studying the features that explain the workings of the natural world and establish a classification order in it. As exemplified by the pairs of images developed by Guidobaldo del Monte for his *Mechanicorum liber* of 1577 (Fig. 1), the necessary step to endow visual representation with epistemological value was the mathematization of its forms, i.e., the reduction or translation of the visible into diagrammatic forms, which may be studied by geometric analysis. This commitment to this diagrammatic reduction and to geometry as the approach to study the natural world is epitomized by Galileo's statement that "this grand book – I mean the Universe – cannot be understood unless one first learns to comprehend the language and the characters in which it is written. It is written in the language of mathematics, and its characters are triangles, circles, and other geometrical figures, without which it is humanly impossible to understand a single word of it" (*Il Saggiatore* 1623).

Imagination in Renaissance Literature

Alberto Luca Zuliani

Department of German and Romance Languages
and Literatures, Johns Hopkins University,
Baltimore, MD, USA

Abstract

The concept of poetic imagination began to be a matter of theoretical discussion only during the Renaissance period. The Italian humanist Marsilio Ficino is one of the first thinkers who explicitly links poetry and imagination, ambiguously stressing both the nearly divine

power of poetic creativity and its possible relationship with sophistry. Intersecting the ongoing debate on imitation, the discussion of poetic imagination finds a theoretical peak, in Italy, in the dispute between Jacopo Mazzoni and Torquato Tasso around the notion of the fantastic nature of poetry. In France, Jacques Peletier du Mans, Pontus de Tyard, and Pierre de Ronsard all emphasize, instead, the necessity of the strict control of reason over imagination on the part of the poet. This concern is shared by English poets and critics as well, and Sir Philip Sidney's considerations on poetry are the most relevant attempt, during the Elizabethan Age, to justify the creative power of poetic imagination as ultimately rational.

Heritage and Rupture with the Tradition

The notion of imagination began to be consistently discussed in relation to literature only in the sixteenth century, as a result of the innovative approach Renaissance thinkers took in dealing with poetry as form of art. The notion was already present in both antiquity and the Middle Ages, but its discussion was confined to the specific realm of natural philosophy: usually positioned alongside the categories of common sense, fantasy, estimative power, and memory, imagination was one of the internal senses that the Middle Ages inherited, through Avicenna, Averroes, and Albert the Great, from Aristotle's account of the functions of the human mind. Seldom were these categories used to address the topic of the creative process that literature required. On the contrary, in dealing with poetry, medieval thinkers would mostly rely on the ancient tradition of rhetorical theory, considering poetic creation as a matter of selecting and organizing the content (*inventio*), putting it into due order (*dispositio*), and expressing it in agreeable and persuasive language (*elocutio*). The formulation of a theory of the poetic mind was neither available nor needed (Bundy 1927; Cocking 1991; Copeland 1991; Langer 1999).

An early change of perspective emerged in the second half of the fifteenth century with the work

of the Italian humanist Marsilio Ficino. Despite not elaborating any specific aesthetic system, Ficino brought attention to a number of elements that would later be combined or associated with the notion of imagination as the artist's creative faculty. Ficino adds nothing to the traditional Aristotelian idea of imagination, often indistinguishable in his writings from the related faculty of fantasy: imagination, as Neoplatonics, Arabs, and Scholastics had it, is thought of by the Italian thinker as a faculty which mediates between sense and intellect, translating sensations into mental entities and combining their fragments into a unity. Yet, by reducing all the arts (intended as in the Greek term *technai*) under the aegis of imagination, Ficino clearly links this faculty to creativity and, by means of it, to divine creative power. As he states in the *Platonic Theology* (1469–1474), the exercise of the intellectual arts – among which poetry lies – is not only the sign of man's superiority over the animal world but also the way in which man can rise above the dependence on the body and access almost the same genius of the Author of the heavens, understanding His own creation.

Ficino's attitude toward imagination remains, nevertheless, highly ambiguous. Along with the conception of imagination as a faculty which, by mediating between the particular and the universal, helps man in the ascent to divine unity, Ficino also retains a possibly opposite view, namely, the idea of fantasy as the main instrument of the sophistic trickster. Translating Plato's dialogue *Sophist* into Latin, the Italian humanist, in his commentary on the work (1494–1496), traces the distinction made by Plato between "icastic" and "fantastic art" and makes it his own. According to Plato, icastic art, dealing with likenesses, is an imitation of the truth, while fantastic art, dealing with appearances, abandons the truth in order to achieve beauty. The latter, therefore, is also the potential realm of sophistry and, according to Ficino, of the illusory tricks of demons. Imagination, in short, can be deceptive. And if Ficino's conclusions mostly help him to distinguish his own philosophy – which deals with truth – from the distorted reasoning of the sophist who disseminates false

opinions, Renaissance thinkers will not spare time in considering it a matter of the utmost importance for the definition of poetic imagination as such (Garin 1988; Allen 1989; Cocking 1991; Giglioni 2010; Giglioni 2011; Moreschini 2016).

Innovative and Original Aspects

The reinsertion of the issue of the relationship between imagination and truth operated by Ficino is indeed crucial to the development of the discussion about poetic imagination in the Renaissance, particularly when, at the end of the fifteenth century, the deepening of the comprehension of Aristotle's *Poetics* triggered a fierce debate around the questions of aesthetic representation, credibility, and verisimilitude in poetry. In Italy innumerable authors addressed the topic, but the debate reached its peak with Jacopo Mazzoni and Torquato Tasso, who engaged in an elaborate dispute that would have long-lasting consequences on subsequent scholars and poets.

Jacopo Mazzoni published his ideas on poetry in the *Defense of the Comedy of Dante* in 1587. By drawing on both Platonic and Aristotelian theories of artistic imitation, Mazzoni defines poetry as an art whose only object is image-making – an art which is the representation of idols (*idoli*). Having their origin in the imagination, idols may refer to both existing and non-existing things, according to Mazzoni, and, in this sense, relying on the distinction made by Plato in the *Sophist*, icastic imitation would deal with the first category of idols while fantastic imitation with the second one. Yet, the already Platonic division becomes for Mazzoni a clear difference of modes of reproduction and related disciplines: icastic imitation, dealing with likenesses, is considered the most appropriate kind of imitation for the writing of history; fantastic imitation, on the contrary, dealing with appearances, is seen as closer to the nature of poetic invention. Fantasy thus becomes the very essence of poetry.

This does not mean, however, that poetic imagination can be totally disconnected from reality. The importance of belief and believability – together with the notion of poetry's wonder –

is constantly stressed by Mazzoni as the first feature of poetic creation. Rather, the tension created between the innate falsehood of poetic matter and the believability of artistic fabrication is the hallmark of all good poetry: between a believable lie and an unbelievable truth, a real poet, for Mazzoni, should always choose the former. In this sense, poets are sophists, according to the Italian thinker, but the term does not bear the usual negative connotation. Precisely because of their sophistic ability to make the untrue probable, poets have a better sense of what is rational and real than other people, including philosophers. In addition, Mazzoni concludes, to the extent that it stimulates in human beings a natural response to rational assent and belief, poetry may in fact have a lasting impact on the ethical and political dimensions of human life (Weinberg 1961; Scarpati 1987; Giglioni 2010).

Mazzoni's ideas found a ready response in Tasso's re-elaboration of his *Discourses on the Art of Poetry* (1587) under the new title, *Discourses on the Heroic Poem* (1594). Rejecting any association between poetry and sophistry, here Tasso attributes to Mazzoni the fundamental error of having considered the false to be the primary matter of poetic creation. Even conceding that poetry, like sophistic art, creates idols, poets, unlike sophists, work with true actions, according to Tasso: far from being just a matter of believability, poetic verisimilitude has to have a close relationship with truth to be perfect, as the perfect poet has to imitate things that are, were, or may be. The imitation of things that are not and never were – in short, Mazzoni's fantastic imitation – is therefore completely rejected.

Tasso's refusal of Mazzoni's positions, however, comes at the expense of a radical intellectualization of the notion of imagination and its representative powers. The limitation to existing things of a poet's ability to imitate excluded a number of impossibilities and falsities which were, as a matter of fact, imitated. Drawing on Platonic sources, Tasso thus has to maintain that things that are in the genus of being are only the intelligible ones, while visible things are in the genus of not-being. Considering that poetry should imitate things that are, this means

for Tasso that poets should imitate intelligible realities and not the visible ones. Angels, winged lions, eagles, and oxen, to the extent that they are images of the evangelists and therefore intelligible, do not fall within the province of fantastic imitation, but instead are icaastic like any other representation of concrete reality (Scarpati 1987; Russo 2002; Giglioni 2010).

The dispute between Tasso and Mazzoni accounts for a theoretical complexity that was, nonetheless, primarily Italian. In France, the penetration of Aristotle's *Poetics* was slower than in Italy, and, consequently, the debate remained more within the limits of the traditional rhetorical frame, in a continuous confrontation with the poetic rules set by Horace's *Ars poetica*. Especially with the rise of the Pléiade group, the French poets' interest was directed less at theorizing about poetic imagination than at defining the proper way of imitating the admired models of Greek and Latin antiquity. From the classical models, they aimed to derive, after all, both a mediated inspiration and the necessary skills to exploit it.

French thinkers, thus, can generally be seen as sharing a certain mistrust toward the creative power of imagination, claiming, by contrast, that poets should be guided, first of all, by reason. Even though the rhetorical notion of invention increasingly shifts its meaning to encompass some of the characteristics that pertain to imaginative creation, the structure of rhetorical theory is always maintained as seminal, in the French Renaissance, and it consequently maintained its focus on the intellectual rather than on the inventive work of the poet. Pontus de Tyard, for example, writes in his *Solitaire premier* (1552) that poets must not give their approval to all of their own inventions but, after examining them from all sides with the skill of understanding, they must reject those that are frivolous and unnecessary and choose only the good and praiseworthy. Jacques Peletier du Mans in his *Art poétique* (1555) takes the same approach by recommending that, after writing, poets should allow their inventiveness to cool, and then, only when they are refreshed from their labors, should they go back to their work and criticize.

A similar approach can also be found in the theoretical reflections of one of the most important poets of sixteenth-century France, Pierre de Ronsard. In his first preface to the *Franciade* (1572), Ronsard makes the distinction between the true and the verisimilar in poetry, affirming that the poet must be as vivid and realistic as the historian, and must not distort facts or – and here he shows his concerns with how the audience’s imagination will respond to poetry – depart from what is already assumed by general opinion. The guidance of reason, however, is stressed one more time by Ronsard when he talks about the overall disposition of the matter which constitutes the poet’s work. Taking Ludovico Ariosto’s romance *Orlando furioso* as negative example, Ronsard claims that the poet should not feign fantastic poetry: this, as the example of Ariosto shows, would end up in a monstrous delirium, ultimately unrecognizable as poetic. As for Horace, freedom of imagination is allowed, for Ronsard, only within the limits of the probable and the congruous. When, in the *Abrégé de l’art poétique* (1565), he had defined poetic invention as the *proper* natural workings of imagination, Ronsard had the same concept in mind, after all: poets should be aware of the perils of a disordered imagination and follow their inventiveness only when it is appropriate and compliant to their intellect (Cocking 1991; Barron 1992).

Impact and Legacy

The necessity identified by Ronsard of a clear distinction between reasonable poetic imagination and fantastic delirium was likewise central in the English Renaissance. As Francis Bacon put it in his *The Advancement of Learning* (1605), imagination was thought during the Elizabethan Age to be a necessary faculty in man’s acquisition of empirical knowledge and understanding. Still, sharing a commonplace of Renaissance psychology which had been particularly negative for poets, he also pointed out that imagination often has the habit of transcending its proper role and getting out of control: according to a well-known Baconian simile, reason has the same power over imagination as a

magistrate has over a free citizen, who, however, may also come to rule in turn. Poetic inspiration, in this sense, was frequently perceived as one of these cases, which joined, as William Shakespeare admitted, poets’ inventiveness with lovers’ altered consciousness and lunatics’ hallucinations.

Given the general disrepute of the notion of poetic imagination, English poets reacted with a number of writings in defense of their art. Despite drawing upon familiar Renaissance materials, significant views of imaginative creativity evolved as a result. Most of their attempts aimed at stressing the difference between the notion of poetic imagination and the idea of imagination commonly conceived, as George Puttenham made it clear in his *The Art of English Poesy* (1589). As opposed to historians and mere versifiers, feigning was declared the poet’s natural function, and fiction his product. Poetic feigning, however, was defined as the result of a skilled and educated imagination, which in the real poet, far from being free and uncontrolled, is always subject to the higher power of reason. Feigning in poetry is therefore portraying the false but does so according to a purpose that is deliberate, moral, and rational. Poetry’s imaginative creation and its emotional effect are guided by the conscious reason of the author to secure, in turn, directly or indirectly, rational and moral effects.

A decisive formulation of these arguments can be eventually found in Sir Philip Sidney’s *The Defense of Poesy* (1595). Poetry and imagination here are ultimately linked to one another in an inextricable way, and it is exactly this link to imagination that becomes, in Sidney, the crucial point for the supremacy of poetry over all arts and sciences. Governed only by the laws of probability, the poet, for Sidney, is the only one who can abandon historical fact and create a world of more universal and, therefore more neatly perfect, ethical dimensions. As etymology confirms, the poet is indeed a maker, and precisely because of this unique status, he is the only one, unlike the historian and the philosopher, who is capable of persuading to knowledge and virtue through his imaginative ability. Sidney had too little time to demonstrate his theories in practice; and yet the blossoming of the great English literature is in no

small measure a response to Sidney's example, which was to be the theoretical point of departure for the age of Spenser, Shakespeare, Donne, and Milton (Bundy 1930; Rossky 1958; Trimpi 1999; Mack 2004; Smid 2017).

Abstract

In the Renaissance, the imagination was considered a crucial mental power which played a key role in the building of knowledge as well as in the individual's relationship with external reality. It was believed to act on the data of sense perception by unifying them into a single representation. This, in turn, would enable the work of reason and, as a result, the mind's procession of the objects of knowledge. Because of its intermediate position, the imagination was also thought to convey the influence of the soul to the body and vice-versa and to account for many psycho-physiological processes, such as falling ill and recovering. It was also thought to be able to act at a distance, a concept that posed no little challenges to many philosophers of the time, from Marsilio Ficino to Francis Bacon.

Heritage and Rupture with the Tradition

The Renaissance understanding of the imagination is informed and inspired by the Platonic and

the Aristotelian traditions. Platonism strongly advocated the ontological difference between the intelligible and the material worlds, the latter being a mere reflection of the former. According to this metaphysical premise, the embodied soul finds itself in a world of “images” and its epistemological approach must necessarily involve a wide use of the imagination. Aristotle's view that the imagination is a movement which results from an actual exercise of the power of sense (*De anima*, III.3.429a1) and continues when sensation has ceased, as in sleep (*De somno et vigilia*, III.461a), remained a key point of reference in the debate about the powers and limits of the imagination throughout the period. Likewise, his famous claim that the soul never thinks without an image (*De anima*, III.7.431a and III.8.432a) played a chief role in linking the imagination with cognitive activities. Plotinus's reinterpretation of Aristotle's position in a Platonic context, which became available indirectly through many of Marsilio Ficino (1433–1499)'s works as well as directly with the publication of his Latin translation of the *Enneads* in 1492, contributed to consolidate the belief in the cognitive power of the imagination. Plotinus made an important distinction – which will prove highly influential in the Renaissance – between a higher and a lower level of operation of the imagination, the former reaching up to a pre-intellectual level and the latter immediately following sense-perception. Avicenna's *Liber de anima*, which had been widely discussed in the Middle Ages, was fundamental for the belief that images were able to affect external objects (*Liber de anima*, 65). The transitive power of images is a key feature of Renaissance discussions on the imagination. Up to the emergence of modern science in the seventeenth century, images were thought to have the power to modify bodies, causing harm (or good) to them and even reshaping their material structure (Giglioni 2011, 28). Renaissance authors, moreover, emphasized the ontological and epistemological prominence of the imagination, which they saw as a faculty which mediated between different levels of knowledge and reality, enabling the interaction between the body and the intellect, as well as between man and higher beings.

Innovative and Original Aspects

The imagination's transitive power and its ability to bridge different levels of life and knowledge are key aspects of the Renaissance understanding of this faculty, of which Marsilio Ficino gives a representative account. For him, the imagination is the faculty which first enables the de-materialization of the objects of sense-perception by producing an image of them, which will then be processed by reason. He divides the hierarchy of cognitive moments into sensation, imagination, reason, and intellect and claims that the imagination "rises above matter higher than sensation, both because in order to think about bodies it does not need their presence, and also because as one faculty it can do whatever all the five senses do" (Ficino 2002, VIII.1, 263). Following Plotinus, Ficino distinguishes between a lower and a higher imagination, which he calls *imaginatio confusa* and *imaginatio discreta* (or *phantasia*). *Imaginatio*, he says, joins the data individually received by the five external senses into a single representation but is not able to identify its object as a specific substance. It produces only simulacra, i.e., confused images of things. *Phantasia*, by contrast, works on the images put together by *imaginatio* and translates them into mental entities (Kristeller 1943, 234–236; Heitzman 1935). In doing so, it already operates on a pre-intellectual level, in the sense that it is able to produce particular concepts, which "are called, as it were, the incorporeal intentions of bodies" (Ficino 2002, VIII.1, 265). To explain this difference, he gives the following example: when Plato is absent, Socrates thinks about him through his inner imagination: the color and shape which he had seen, the gentle voice he had heard and everything else he had perceived through the five senses. *Imaginatio*, therefore, recreates the visual and auditory representation of Plato when he is not there, but knows nothing about the person to whom the color, shape, and voice belong. When *phantasia* comes into play, Socrates realizes that the colors, shape, and voice belong to Plato, "a fine-looking, good man, and a most cherished disciple" (Ficino 2002, VIII.1, 265; Heitzman 1935). Ficino also convincingly subscribes to the belief in the transitive action of the imagination, which, he says, can become a

pernicious instrument, especially if used against children and others of an impressionable age (Ficino 2004, XIII.1.1, 110). The imagination of a sorcerer, for example, can cause a fever in the tender body of a child (Ficino 2004, XIII.4.8, 193), because "the image of the fever arouses the child's febrile spirits, just as imagining intercourse arouses our seminal spirits and genitalia" (Ficino 2004, XIII.4.8, 193). Likewise, the evil eye can harm and even kill people (Ficino 1989, III.16, 325) and the imagination of a pregnant woman can easily affect the tender body of the fetus with the stamp of what is in her mind (Ficino 2004, XIII.4.1, 111). In love-sickness, the image of the object of love was thought to become impressed in the *spiritus*, the pneumatic substance which was thought to be the organic seat of the imagination, originating in the brain from the heat of the heart and from there flowing throughout the body. From the *spiritus*, the image is transmitted to the blood which "painted with a certain likeness draws the same image in the limbs" (Ficino 1987, 202; Giglioni 2011, 46). The imagination, for Ficino, has also important demonological implications and he provides a complex account of the relationship between this faculty and various types of demonic intervention (See Corrias 2013; Giglioni 2010a, 2011; Allen 1989, and 1992). Intriguingly, he also claimed that after death the unrestrained force of the imagination could cause the soul of the wicked man to see "the heavens crashing on his head or himself being swallowed up in the deep fissures of the earth" (Ficino 2006, VI.18.10, 197). Using the same arguments, he also tried to justify the heterodox belief in the soul's transmigration into animal bodies, advocated by authoritative philosophies such as Pythagoreanism and Platonism (Corrias 2012; Hankins 2005). He argued that when ancient philosophers described human souls being implanted in the body of animals, they were just referring to the contents of their distorted imagination. Taking this position to the extreme, Giordano Bruno (1548–1600) claimed that hell exists only for those souls who produce imaginary pains out of the fear of the tortures which are traditionally promised to the sinners. If during earthly existence the imagination is deeply influenced by the belief in infernal punishments, after death these faculties will cause the soul to experience excruciating sufferings (Klein

1970). In Bruno's theories of bonds (*vincula*), i.e., spiritual influences which enchain and manipulate the soul, the imagination is described as an important gateway for these influences, "the only entrance for all internal feelings," "the bonds of bonds" (Bruno 1998, 141) through which belief is created. Indeed, bonds do not need to be real, i.e., "found in things" (Bruno 1998, 164). In fact, they can be even stronger if they rely on deceptions: "For the imagination of what is not true can truly bind, and by means of such imagination, that which can be bound can be truly bound" (Bruno 1998, 165). The imagination, however, was not only important in theories of knowledge. It had a significant part also in religious experiences, as it could help the soul to visualize some aspects of the divine, which lay beyond the reach of thought. Giovan Francesco Pico della Mirandola (1470–1533) claimed that "imagination is for the most part vain and wandering" (Giovan Francesco Pico della Mirandola 1930, 29), but it can also provide support to faith. By contemplating the image of Christ on the cross, for example, we can gain a certain knowledge of divine nature which can induce in us a natural disposition (*habitus*) to religious life (Giovan Francesco Pico della Mirandola 1497, 36; Mucillo 2007, 19). On the Aristotelian side, the relationship between imagination and belief was widely discussed by Pietro Pomponazzi (1462–1525), who believed that the force of the imagination, when joined with belief, could modify the *spiritus* in such a way that this could evaporate and transmit to the outside world the images which were impressed on it. These mechanism, for him, could explain complex phenomena such as miracles, omens, and apparitions. In a well-known passage from *De incantationibus* (1556), he discusses the apparition of Saint Celestine to a group of worshippers in the Italian city of L'Aquila, after these had prayed intensely for days in the hope to dispel a devastating hailstorm. This apparently miraculous vision, he says, was caused by the *spiritus* of the worshippers which, evaporating from their bodies, impressed the image of the saint in the air (Pomponazzi 1567, 239; Walker 2000, 108). Pomponazzi's focus is both on the physiology of the imagination, which involved bodily processes such as the modification of the blood and of the *spiritus*, and the on psychological aspects, such as

faith and credulity, which put into motion these processes. For him the imagination, inflamed by faith and belief, did not only project its potent effects on the outside, as in the case of apparitions, or on other people's bodies, as with the evil eye. Through a complex mechanism of autosuggestion, the imagination could also affect the believer's own body, as in the case of Saint Francis's stigmata (Pomponazzi 1567, 67). In the *Sylva Silvarum* (1626), Francis Bacon (1561–1626) explores the degree of truth of the idea of a transitive power of the imagination and confirms Pomponazzi's view that imagination and belief, when mutually influenced, can cause autosuggestion and have significant psychosomatic effects. He recounts the story of a juggler – whose imagination was disbelieving and therefore not strong enough to act on other people's imagination – claimed that he could guess the card somebody else was thinking of without seeing it. However, rather than telling the card himself, he whispered it in the ear of an observer, who later repeated it out loud. The reason for this complex system of interactions between the juggler, the participant in the card trick and the observer is to be found in the subtle interplay of imagination, belief, and disbelief which made the trick possible. The juggler was aware of being an impostor and had no belief in his own mind-reading powers but knew that the observer had a strong faith in his alleged competence and ability as a juggler. This faith fed the observer's imagination which grew stronger and became able to bind the other man's imagination, inducing him to reproduce in his mind the image of the same card (Bacon 1857-1874, II, 655; Giglioni 2010b; Yates 1966, 359). In his *Discourse of the Powder of Sympathy*, first published in 1658, Kenelm Digby (1603–1665) describes the human body in terms of a kingdom, in which the animal spirits, or *spiritus*, are the sentinels and the imagination is the general. The *spiritus* brings the information deriving from the sense organs to the imagination, "whereby a man may know and understand what is done without the Kingdom, within the great world" (Digby 1664, 89). However, in Digby we find an attempt to give a scientific explanation of the workings of the imagination (Lobis 2011) and he explains birthmarks with the joint action of the

imagination and atoms coming from the outside world (Digby 1664, 84 and ff.). This position anticipates the approach which became dominant at the end of the seventeenth century. With the emergence of modern science, philosophers sought to identify natural causes for those portents traditionally ascribed to the power of the imagination, which was gradually dethroned from being the queen of mental faculties, banished from theories of knowledge and exiled to the field of aesthetics.

Imitation and Mimesis in the Renaissance

Chiara Girardi

Abstract

Numerous debates and epistolary exchanges concerning the imitation of ancient authors flourish in Italy between 1400 and 1530. These disputes are to be read through the lenses of the humanist desire to restore classical Latin. This desire characterizes the period following the rediscovery of ancient texts, such as Cicero's *Epistulae ad Atticum* that Petrarch found in Verona in 1345. The renewed interest in authors and rhetoricians such as Cicero, Seneca, and Quintilian inform humanist discussions regarding style and eloquence in Latin. More specifically, starting from the early Quattrocento, scholars and intellectuals debate over which author to imitate, and many humanists see Cicero as the sole model to follow. Therefore, many quarrels reflect the intense arguments between strict Ciceronians and the supporters of eclectic imitation. This obsession with linguistic purism extends to the vernacular, and Pietro Bembo's *Prose della Volgar Lingua* (1525), where Petrarch and Boccaccio become ideal models for writing in "classical" standard Italian, represents the culmination of this linguistic movement from Latin to the *volgare*.

Heritage

Imitatio deals with the theories and practices of imitating a previous author, who is regarded as a model of stylistic excellence. The concern with imitation and the quest for ideal models to imitate appeared in the fourteenth century when intellectuals rediscovered ancient manuscripts that allow them to have unmediated contact with classical Latinity. As writers attempted to imitate the language and style of classical authors, they engaged in quarrels about style, whose foundational theories drew largely from ancient sources, namely, Cicero and Quintilian. The theories of literary imitation that are analyzed here will shed light on the practices of writing in Latin and in the vernacular during the period 1400–1530 as well as on the rise of Ciceronianism (McLaughlin 1995).

The imitation of models of stylistic eloquence, or "rhetorical imitation" as Martin McLaughlin and G.W. Pigman III define it, is to be distinguished from the imitation of nature, or *mimesis*. The term *mimesis* is originally Greek; it means to imitate, and it is most commonly used to define the imitation or representation of nature in literature and art. The distinction between the two kinds of imitation was not always maintained during the Renaissance, and sometimes the two terms even became interchangeable: for instance, Lodovico Dolce and Alexander Pope claimed that to imitate the greatest authors was another way of imitating nature. Most intellectuals during the Renaissance only addressed the imitation of literary models in their debates and rarely discussed the philosophical implications of reproducing nature in their writings (Greene 1982; McLaughlin 1995).

In classical antiquity, the most notable reference to *mimesis* in literature and, more specifically, poetry was to be found in the tenth book of Plato's *Republic*, where the philosopher defined all artistic creation as a form of imitation of the reality; but, since Plato considered reality itself as merely a *mimesis* of a higher plane of being, the concept usually had pejorative connotation. He believed painting and poetry were unable to imitate ideas and claimed that they simply reproduced the appearance of the phenomenal

form of things. Therefore, *mimesis* was defined as the production of an appearance (Gebauer and Christoph 1995; McLaughlin 1995).

Later, Aristotle, in his *Poetics*, claimed that poetry is *mimesis*. He elaborated the idea of poetic *mimesis* in relation to tragedy and defined the concept both in the sense of producing images and in the sense of creating a fable or a plot. Aristotle emphasized the mimetic aptitude as anthropological constant distinguishing human beings from other animals, and as such they feel the urge from an early age to reproduce reality in the arts. Aristotle used *mimesis* to refer to the representation of life in a work of art and believed that *mimesis* corresponded to the capacity to reproduce resemblance through artistic media (Gebauer and Christoph 1995; McLaughlin 1995; Sörbom 2002).

Regarding rhetorical imitation, Isocrates was the first to apply the concept to literature when he added *imitatio* to the three components of Greek rhetoric: nature, theory, and practice. In classical antiquity, the writers who provided the most extensive commentary on the subject matter were Cicero (*De Oratore* 2.89-90), Quintilian (*Institutio Oratoria* 10.2), the author of the *Rhetorica ad Herennium* (1.2.3), and Seneca (*Epistulae* 84). These authors were widely aware of the negative connotations generally associated with *mimesis*, or with reproducing reality; therefore they most often tended to be cautious when discussing *imitatio* and, particularly, its dangers. Moreover, it is relevant to note that the classical ideas and theories of *imitatio* drastically changed during the Renaissance: in fact, most classical authors were inclined to distance themselves from single-model imitation, a concept which will be widely debated in the Quattrocento and in the Cinquecento (McLaughlin 1995).

Quintilian outlined the motivation and importance of *imitatio* as an essential component of developing any form of art, whether writing, oratory, painting, or others. Imitation alone does not guarantee artistic excellence, and excessive reliance on superficial imitation of the predecessor at the expense of originality and innovation can be dangerous. Quintilian saw in Cicero the foremost model of eloquence, but he never suggested that

one model be used as the exclusive source of eloquence. Additionally, he claimed writers should not hesitate to rely on their own inner talent, or *ingenium* (Della Neva 2007; Fantazzi 2014; Pigman 1980).

Similarly, the anonymous author of the *Rhetorica ad Herennium* suggested that *imitatio* was merely one of three principal activities of a good writer, the other two being technical proficiency (*ars*) and practice (*exercitatio*). The author recognized *imitatio* as part of the orator's duty to borrow from the predecessors in such a way as to signal the imitation to the audience, but also to alter in some way the material borrowed (McLaughlin 1995).

The goal of using previous texts to improve one's own writing was expressed by Seneca in his *Epistulae* 84, where he famously employed several metaphors to clarify the process of imitation to explain the relationship between the model and the new text and, also, to describe both proper and improper imitative techniques. G.W. Pigman divides the images largely used in antiquity and in Renaissance debates in three categories of metaphor: transformative, which includes the apian, digestive, and filial metaphors; dissimulative, which refers to camouflaging the relationship to the model; and lastly, eristic, or all those images that underline the competition against the model (Della Neva 2007; Goethals 2015; McLaughlin 1995; Pigman 1980).

Senecan metaphors from this letter will continue to appear in later debates in the Quattrocento and Cinquecento and will shape early modern approaches to the theory and practice of literary imitation; therefore it is important to discuss at this stage the most common images that will be employed in the quarrels here analyzed. The first metaphor is that of a bee taking pollen from various flowers, which it then transforms into its own unique honey. The second analogy is a digestive one where the inspiring models are defined as different kinds of food that need to be digested. A third metaphor explores the relationship between an artistic image and its original model, which should resemble the relationship between a father and his son. Lastly, the imitation should sound like a choir that has produced a unified

note out of multiple voices. There are also several metaphors that underline the failures of the transformative process, such as the images of the crow and the ape (Della Neva 2007; McLaughlin 1995; Pigman 1980).

Innovative and Original Aspects

It was no coincidence that fourteenth-century authors experienced a revived interest in literary imitation once many classical manuscripts on the subject – including Cicero’s *De Oratore* and Quintilian’s *Institutio Oratoria* – were rediscovered in their complete form. In the early modern period, Petrarch (1304–1374) was the writer that most actively engaged with the theory and practice of imitation. Additionally, his letters (especially *Epistolae Familiares* 1.8, 22.2, and 23.19), where he discussed his views on imitative practices, served as a theoretical foundation for fifteenth- and sixteenth-century debates on *imitatio*. Petrarch was widely influenced by classical authors: for instance, his epistolary collection was precisely inspired by his discovery of Cicero’s *Epistulae ad Atticum* in Verona in 1345. Moreover, he owned a manuscript containing Cicero’s rhetorical works and a copy of Quintilian: from Cicero, he learned the importance of avoiding unfamiliar words in one’s narration, while Quintilian taught him not to imitate just one model (Della Neva 2007; McLaughlin 1995).

In *Epistolae Familiares* 1.8, written to Tommaso Caloiro, Petrarch discusses literary imitation and the issue of originality. The letter is a clear illustration of Petrarch’s theories: here the poet wants to avoid verbatim imitation of Seneca’s *Epistulae* 84 and shows his preference for rewriting the substance of his predecessor’s writing using different words. He employs Seneca’s apian metaphor but introduces a critical change: in fact, Petrarch exhorts his correspondent to take the best of his (literary) surroundings, as the bees collect pollen from different flowers to produce honey. However, a young writer should transform what he has collected into something new and original: “Nulla quidem esset apibus gloria, nisi in aliud et in melius inventa converterent”

(“the bees would not be glorious if they did not convert what they found into something different and something better” *Fam.* 1.8.23-24). In the letter Petrarch emphasizes the fundamental role of transformation and insists on the idea of “mellification,” or of something new produced “by a miraculous blending process” (“mirifica quadam permixtione,” *Fam.* 1.8.2) (Fantazzi 2014; McLaughlin 1995; Pigman 1980).

In *Epistolae Familiares* 22.2, written in 1359 and addressed to Giovanni Boccaccio, Petrarch’s concern is with the concept of imitation and also practical changes in his own *Bucolicum Carmen*, where he had inadvertently reproduced whole phrases from Virgil, which he now wants to alter. This episode leads Petrarch to discuss his own imitative practices: he underlines the importance of eclecticism and to avoid verbatim repetition: “nisi vel prolato auctore vel mutatione insigni, ut imitatione apium e multis et variis unum fiat” (“unless I either name the author, making it a quotation, or change the phrase significantly, so that like the bee I produce something unified from many and various sources,” *Fam.* 22.2.16). Petrarch claims imitation should strive for *similitudo* rather than *identitas* and, in fact, believes that, even if an author follows a literary model, it is fundamental for the writer to preserve artistic autonomy (McLaughlin 1995).

In *Epistolae Familiares* 23.19, once again addressed to Boccaccio and composed in 1366, Petrarch describes the efforts of Giovanni Malpaghini, who overindulges in imitation but, according to Petrarch, will soon develop a more independent style by imitating the masters. Petrarch expresses his key concepts by using Senecan imagery such as the father/son metaphor. Different from Seneca, the poet believes the resemblance between the new work and the original should be noticeable to the unconscious mechanisms of the intellect: “Sic et nobis providendum ut cum simile aliquid sit, multa sint dissimilia, et id ipsum simile lateat ne deprehendi possit nisi tacita mentis indagine, ut intelligi simile queat potius quam dici” (“So we should ensure that, although some elements are similar, many are not, and that even what is similar should not be obvious, but should only be apprehended by the

silent inquiry of the mind: the similarity should be intuited rather than articulated,” *Fam.* 23.19.13). As such, dissimulation becomes a central factor in Petrarch’s conception of imitation (Fantazzi 2014; McLaughlin 1995).

Petrarch’s vernacular poetry reflects his imitative theories and practices in Latin. Martin McLaughlin discusses several examples from *Rerum vulgarium fragmenta*, specifically *RVF* 216 with regard to verbatim imitation. In fact, the poem presents almost direct translations from Virgil and Cicero, which do not seem to bother the poet because using the vernacular corresponds indeed to use different words from the model. Moreover, *RVF* 321 demonstrates Petrarch’s sensitivity to verbal repetition, which is included in the practice of self-*imitatio*. Ultimately, McLaughlin analyzes Petrarch’s many revisions of his vernacular poems in connection to the poet’s pursuit of clarity and middle elegance in style (McLaughlin 1995).

Lastly, it should be emphasized that, while Petrarch recognized Cicero’s supremacy as a prose stylist in Latin, he did not recommend relying on Cicero as a sole model. He reiterated classical theories according to which a writer should imitate a number of different models and, additionally, that he should penetrate beyond superficial *verbatim* imitation to a reworking that captures the original spirit and significance of the model. Scholars agree that Petrarch was the most influential theorist of *imitatio* for the century that followed his death; and his eclectic practice of imitating classical authors would represent the stylistic foundation for future humanists until the second half of the fifteenth century (McLaughlin 1995).

Impact and Legacy

In the Quattrocento, *imitatio* was an idea and practice that is familiar to all intellectuals, and theoretical debates on the subject matter are present in the treatises and epistles of authors like Poliziano and Leon Battista Alberti to pedagogues such as Antonio da Rho. The cult of Ciceronian style can be interpreted as a consequence of the

increasing sophistication in the study of classical texts at the beginning of the fifteenth century that grew out of the rediscovery of ancient manuscripts from classical antiquity. That led to a desire to emulate classical language and to purify ancient Latin, which could be read as a reaction to the linguistic practices of scholastic Latin usually found in the universities (McLaughlin 1995).

In the early Quattrocento, Coluccio Salutati (1331–1406) and Leonardo Bruni (1369–1444) engaged primarily with the theories and practices of imitation in their own written production, and their thoughts on *imitatio* are to be derived from their writings. Salutati expressed his views on imitation in an epistolary exchange with Bruni. In the initial letter, written in November 1405 to Bruni, Salutati addressed the humanist using a classical form and employed several non-classical items throughout the epistle. Bruni later criticized both stylistic choices. Salutati’s response illustrated his ideals on imitation: first, he offered a clear distinction between duplication and imitation. Second, he argued against a slavish imitation of ancient models and suggested that the imitation retained some aspect of modernity (*novitatis*). As Martin McLaughlin points out, Salutati’s attitude toward literary imitation was in line with his consideration of contemporary culture, which admired classical antiquity, but at the same time acknowledged the superiority of the Christian present (Fantazzi 2014; McLaughlin 1995).

Similar to Salutati, Leonardo Bruni did not theorize much about imitation because he was so proficient at it in the practice of writing and in his translations. He showed an eclectic aptitude because he not only continued the Ciceronian tradition of the oration, the dialogue, and the letter, but he also inaugurated the most distinctive genres of the Quattrocento, for which he was indebted to a variety of classical authors. For instance, in his historical works, he followed Livy, Sallust, and Caesar’s footsteps, while in his biographical accounts; he was clearly influenced by Plutarch. Throughout his practice, he demonstrated to be a Ciceronian for his concern with elegant style but also imitated a plurality of authors, such as Boethius and the Church Fathers (McLaughlin 1995).

Humanist pedagogues in the Quattrocento dealt with *imitatio* as a pedagogical method: it was analyzed as a set of basic rules of rhetorical training rather than a specific stylistic advice. Pier Paolo Vergerio the Elder (1370–1444) was the author of a treatise on education: *De Ingeniis Moribus et Liberalibus Adulescentiae Studiis* (1402–1403); and in a letter of 1396 to Ludovico Buzzacarino, he expressed his views on the practice of *imitatio*. Here the humanist claimed the principle of single-model imitation, and he invited his addressee to imitate only one single model: “sed unum aliquem eundemque optimum habendum esse, quem precipuum imitemur” (“we should choose one single model, one that is the best, whom we should imitate in particular”). Differently from what he stated in his epistolary, Vergerio shows in his educational treatise to be a pluralists, claiming that the young writer should imitate the best authors and teachers (Della Neva 2007; Greene 1982, McLaughlin 1995).

Gasparino Barzizza (1360–1430) was the author of *De Imitatione*, a most likely unfinished work written in an elementary style. The text addresses those who have just graduated from the study of grammar to the art of rhetoric; therefore it develops a basic approach to the *quaestio*. The treatise provides simple advices how to adapt models, and it is widely influenced by major authors such as Quintilian and especially Seneca, as it is confirmed by the presence of many traditional metaphors. He explains imitation can take place in *inventio*, *dispositio*, and *elocutio* and that it is divided into four categories: additions, deletions, transpositions, and, lastly, alterations. Moreover, he recommends that the students not borrow passages from the beginnings of letters and speeches since they are the most identifiable parts of a text. The pedestrian nature of this treatise is evident as Barzizza does not underline the importance of imitation in improving the original model, but he simply claims that the imitator should avoid plagiarism at all costs. As G.W. Pigman explains, Barzizza’s major contribution to the theory and practice of imitation consists of specific methods for transforming texts to hide its relations to the original model (McLaughlin 1995; Pigman 1982).

Antonio da Rho (ca. 1398–1450) was Barzizza’s pupil, and he succeeded him as professor of Rhetoric in Milan after Barzizza’s death. He was the author of *De Imitationibus Eloquentiae* (1430–1433), a thesaurus, which presents a lexicon of more than a thousand entries. The entries reveal a more descriptive than normative approach, and, additionally, Antonio shows an indiscriminate attitude toward the authors to imitate. He considers *imitatio* one of the major components of eloquence, along with *natura*, *ars*, and *exercitatio*. Antonio claims that Cicero is the supreme model to follow, but, similarly to other humanists of the time, he believes he is not the only author to be imitated. He uses a floral metaphor to support his eclectic approach to *imitatio*, comparing students of rhetoric to orchards that produce something new and original from the existing authors of classical *florilegium* (McLaughlin 1995).

Guarino Veronese (1374–1460) was a prominent teacher in Northern Italy. In his writings, he made no explicit statements on literary imitation, but he considered the imitation of Ciceronian style as the peak of stylistic eloquence for the intellectuals of the Quattrocento. Although he often equated *studia ciceronis* to *studia humanitatis*, he never restricted himself to a Ciceronian lexicon in his own writing: his Latin remained varied, flexible, and open to outside influences, such as Pliny. In fact, in 1419, Guarino acquired a manuscript containing Pliny’s *Letters*, which he largely imitated in his epistolary, thus offering a good example of the Veronese teacher’s imitative practices. He avoided verbatim imitation, and, although he demonstrated more complex forms of *imitatio*, he most often followed Barzizza’s teachings, such as turning singulars into plurals (and vice versa), using synonyms and, finally, reversing the order of clauses (Fantazzi 2014; McLaughlin 1995).

Along with pedagogical practices, issues of proper imitation also emerged in theoretical debates through the fifteenth and early sixteenth centuries: one of the most relevant literary debates on *imitatio* in the Quattrocento is the dispute between Poggio Bracciolini (1380–1459) and Lorenzo Valla (1406–1457). The quarrel, which

took place in 1452, summarized the gap that divided two generations of humanists: on one side Poggio stood for a notional Ciceronianism and defended not only Ciceronian style but also the entire medieval literary and philosophical culture. On the other side Valla – following Quintilian’s advice – did not follow a single model, and he did not restrict himself to a single author (Della Neva 2007; McLaughlin 1995).

The quarrel is divided into four parts, where each part corresponds to an invective that one of the two intellectuals wrote: First, Poggio – after hearing that an intellectual criticized his Latin in the margins of a copy of his letters – composed the *Oratio I*, addressed to Valla, who Poggio suspected was the humanist who condemned his style. There, Poggio attacked Valla’s *Elegantiae*. Second, Valla responded with his *Antidotum Primum. Libri III*; then Poggio reacted by writing a three-book invective, the *Orationes II–IV*, to which Valla finally responded with a second *Antidotum*. Poggio never reacted to the latter work, where Valla presented three different levels of un-ciceronian elements in his adversary’s linguistic style: Poggio’s vulgarisms (words derived from the vernacular) such as “disturbium” and “pasta”; forms derived from late scholastic Latin; and, finally, words derived from classical authors, but not present in Cicero’s writings. The dispute confirmed Valla’s superior knowledge of Latin, which was not limited to the vocabulary and grammar but extended to syntax and morphology (Fantazzi 2014; McLaughlin 1995).

It is also worth noting that during the fifteenth century, debates on literary imitation written in the vernacular and that addressed style and eloquence in the *volgare* started to flourish in Italy. For example, Leon Battista Alberti widely discussed the *quaestio* in the *Teogenio* (1440) and in the *Profugiorum ab aerumna libri* (1441–1442). As Martin McLaughlin notes, in the first book Alberti elucidated his pluralistic approach to classical authors: the main character, Genipatro, demonstrates to have a wide taste and knowledge of classical authors and reads Terence, Apuleius, Lucian, Martial, and Plautus but also texts of moral philosophy, educational treatises, and

even agricultural and political writings (McLaughlin 1995).

In the dialogue *Profugiorum ab aerumna libri*, Alberti employs the architectural metaphor of the mosaics, which comes to represent creative and transformative imitation. He compares the artist crafting mosaics from the fragments left over from the construction on the ancient temple of Ephesus to the writer who adorns his works with fragments from the temple of classical literature. The originality that is left to the contemporary author lies in carefully choosing a different variety of classical literary gems and in arranging them in a new context. (Goethals 2015; McLaughlin 1995).

In the Renaissance, the diffusion of early printing technology allowed students of Latin the opportunity to study and imitate a large number of Cicero’s texts, and various intellectuals recommended young writers to only read and imitate Cicero. That led to the flourishing of intense rhetorical debates in Italy, especially in Florence, Venice, and Rome, between strict Ciceronians and supporters of eclectic imitation. The most noteworthy disputes were between Poliziano and Paolo Cortesi (ca. 1485), Giovanni Pico della Mirandola and Ermolao Barbaro (1485), Gianfrancesco Pico della Mirandola and Pietro Bembo (1512), and Giambattista Giraldis Cinzio and Celio Calcagnini (1532–1537). Most notably, the *quaestio* went beyond the borders of the Italian peninsula and reached Northern Europe, where Erasmus engaged with the theories of *imitatio* in his *Ciceronianus* (1528). Such classicism extended to the vernacular, and Pietro Bembo published *Prose della Volgar Lingua* (1525), where Boccaccio and Petrarch (similarly to Cicero and Virgil for Latin) served as models of style and eloquence for “classical” standard *volgare* (Della Neva 2007; Fantazzi 2014; Marsh 2013; McLaughlin 1995; Pigman 1980).

The dispute between Paolo Cortesi and Angelo Poliziano was constituted of an epistolary exchange, which was undated, but most likely happened in the mid-1480s. In the letters the two intellectuals explicated the virtues and limitations of establishing Cicero as the only model of eloquence. The exchange began with a collection of Latin epistles that Cortesi sent to Poliziano and

were presumably written in a Ciceronian style. Poliziano, who supported eclecticism in his literary practices, believed an author could find stylistic excellence by following a variety of great models; moreover, he ridiculed the self-imposed limitation of the Ciceronians that he found in Cortesi's letters. In his response, Poliziano made the famous statement about originality: "Non exprimis, inquit aliquis, Ciceronem. Quid tum? Non enim sum Cicero; me tamen, ut opinor, exprimo" ("Someone might object: 'But you do not express yourself like Cicero.' What of it? I am not Cicero. But I think I express my own self") (Della Neva 2007; Fantazzi 2014; Goethals 2015; McLaughlin 1995).

In the remainder of the letter, Poliziano emphasizes the importance of self-expression. He claims it is impossible to reproduce Cicero exactly; therefore he acknowledges the importance for a young writer to develop his own distinctive style. Poliziano urges Cortesi to cultivate his individual expression rather than following someone else's footsteps. Self-expression is accomplished through the reading of various texts, whose individual excellences can be assimilated and forged into a distinctive new style (Della Neva 2007; Fantazzi 2014; McLaughlin 1995).

In his epistle, Poliziano shows to be an advocate of pluralism and of original compositions both in theory and, especially, in practice, where he illustrates his literary credo of *docta varietas*. For instance, in the letter to Cortesi, he changes the stock imagery related to literary imitation and introduces the metaphor of the magpie and the parrot, and, instead of presenting the bees as traditional image for sound imitation, he speaks of the bull and the lion, two metaphors that successfully suggest the strength of the individual intellect (Fantazzi 2014; McLaughlin 1995).

Poliziano's letter to Cortesi is not the only text where he presents his theories and practices for literary imitation: in fact, his entire production is a testament to his preference for eclecticism. In his 1493 letter to Bartolomeo Scala, Chancellor of Florence, Poliziano argues in favor of a variety of stylistic excellences. Likewise, in his *Oration on Quintilian and Statius*, he states that reading a wide variety of authors prove to be an

essential tool for the aspiring young writer (Della Neva 2007).

Different from Poliziano, Cortesi was a typical Ciceronian, and he exploited the traditional imagery of the debates on *imitatio*. He claimed that true imitation was not the resemblance of an ape to a man but rather the similarity of a son to his father; but he preferred to ape Cicero's style, rather than being the pupil of any other author. Cortesi also used the digestive metaphor to argue against eclecticism and stated that literary "indigestion" resulted from reading and imitating too many authors at the same time. As Martin McLaughlin affirms, through these metaphors, Cortesi recognized the impossibility of reproducing an exact copy of Cicero. Paolo Cortesi's most original contribution to the debate was claiming that literary imitation was linked to the Aristotelian concept of art imitating nature (Fantazzi 2014; McLaughlin 1995; Pigman 1980).

The quarrel between Poliziano and Cortesi had a European resonance in the sixteenth century, and it was widely discussed in Erasmus' *Ciceronianus*. The text depicts the conversation between Nosoporus, a Ciceronian devotee who for 7 years has avoided all books except those by his idol, and Bulephorus, who represents the authorial voice and is in favor of eclectic imitation. The latter claims that even Cicero absorbed his entire heritage and imitated no one closely. Additionally, Bulephorus, alias Erasmus, ridicules Cortesi's argument and accuses him of contradicting himself. In fact, at first Cortesi claimed to have no respect for those who wish to ape Cicero but later affirmed that he preferred to ape Cicero rather than be the pupil of any other writer. As Charles Fantazzi explains, in the *Ciceronianus*, Erasmus refers to Ciceronians as a sect, present mainly in Rome, and they initiated a form of neo-paganism under the guise of trying to purify Latin language. When discussing the quarrel between Poliziano and Cortesi, Erasmus understood that Poliziano's criticism was directed against those without any formal training who wished to reproduce Ciceronian stylistic features and were unable to produce something original and self-expressive (Fantazzi 2014; Greene 1982).

Erasmus's stress on the geographical area where Ciceronianism triumphed is relevant and deserves to be clarified. Most Roman humanists were active in the Papal Curia, and their job consisted in writing ecclesiastical documents in a correct and eloquent Latin. Thus, in Rome, the issue of Ciceronianism was a fundamental practical concern and did not simply constitute an intellectual debate. In fact, as JoAnn DellaNeva claims, Roman humanists saw themselves as the descendants of the great Roman authors of classical antiquity and, therefore, believed that the imitation of Ciceronian linguistic style was an essential tool to succeed in their writings (Della Neva 2007).

The debate that concerned Ermolao Barbaro (1453–1493) and Giovanni Pico della Mirandola (1463–1494) took place in 1485. The exchange dealt with *imitatio*, but it did not enter into discussion on style. The debate is divided into three parts: the initial letter that Barbaro sends Pico, Pico's response, and, finally, Barbaro's second epistle to Pico. The exchange deals with the opposition between *verba* and *res*, or the distance between rhetorical power and philosophical precision. As JoAnn DellaNeva precisely explains, Pico believed in the superiority of *res* over *verba* and stressed the importance of brevity, unadorned lexis, and recondite content: "brevitatem styli, fetam rerum multarum atque magnarum, sub expositis verbis remotissimas sententias" (brevity of style, replete with many great concepts, the recondite ideas lying beneath the clear words). Differently, Barbaro privileged style over substance, and he believed that if style and form were not important, sculptors would only be admired for working with precious material (Della Neva 2007; Fantazzi 2014; McLaughlin 1995).

The opposition originated in antiquity, and it was present in the works of Plato and Cicero, who, in his writings referred to the dichotomy of eloquence and wisdom. Pico pushed this opposition further and claimed that stylistic ornamentation could be damaging to the philosopher who wished to seek the truth. Pico's stand reflected the distance between rhetoric and philosophy that characterized the Renaissance, where – as DellaNeva

explains – no author who aspired to excel in style and rhetoric would be flattered to be called a philosopher (Della Neva 2007).

The debate on *imitatio* continued during the Cinquecento, and the most studied quarrel is between Giovanni Francesco Pico della Mirandola (1470–1533), Giovanni Pico's nephew, and Pietro Bembo (1470–1547). Many scholars interpret this debate as a direct continuation of the dispute between Poliziano and Cortesi, where Bembo demonstrated a Ciceronian approach and Pico maintained a position similar to Poliziano's, although his arguments were more firmly based on philosophical speculations. This dispute took place in 1512, and scholars like Martin McLaughlin read it within the larger picture of Renaissance Italy; thus the debate is intended not simply as a personal clash between the two intellectuals, but it rather mirrors the continuing importance of the *quaestio* of literary imitation in the decades of linguistic extremism (Greene 1982; McLaughlin 1995).

In his epistolary exchange with Pietro Bembo, as well as in *Ioannis Pici Mirandulae Vita* (1496), Gianfrancesco defends his uncle, Giovanni Pico della Mirandola, and his Latin style. He claims that his uncle was more interested in content (*res*) than in words (*verba*) and that he put sacred wisdom above mere verbal embellishment. Moreover, he spoke of the idea of good writing that nature gives to all men: it corresponds to the imitation of the beautiful, which the writer can find in himself and reflected in the writings of other authors, while the rules of rhetoric instill the art of writing (Fantazzi 2014).

Pico fully develops his un-Ciceronian ideals in a previous letter to Ludovico Ricchieri da Rovigo (1469–1525). The letter is modeled after Poliziano's first epistle to Cortesi for its defense of un-ciceronian Latin and for the arguments presented by Pico to support his position. Pico is concerned with originality and variety of styles in his writings. He acknowledges the existence of different styles in Latin, and therefore he privileges an eclectic approach to imitation. He believes that nature, and not imitation, produces any similarity between two authors. Additionally, in the letter, he particularly criticizes those writers

who depend on a specific model so much that, when dealing with a subject that is usually untouched by the model, they appear to be “simiae,” or drawings that are so far from reality that they need a title to indicate what they represent. Similarly to what he will argue later in the letter to Bembo, he claims that the best imitative practice is eclectic and includes the natural instinct of the writer (McLaughlin 1995).

In his first letter to Pietro Bembo, dated 12 September 1512, Pico stresses the importance to imitate from a variety of models and to develop one’s unique style. He once again claims that writers should imitate a variety of authors in order to develop one’s distinct style. Real imitation is not passive, and writers should strive to create something original out of the imitation of their models. Moreover, Pico alerts the danger of anachronism that characterized the Ciceronians since they try to walk in Cicero’s exact footsteps, but they are unlikely to succeed because a modern shoe does not fit exactly these vestigial foot (Fantazzi 2014; Greene 1982; McLaughlin 1995).

Different from the epistle to Ricchieri, Pico claims that a writer’s natural style is based on the Platonic idea of eloquence. Another original element is the exaltation of the *inventio* over *dispositio* and *elocutio*. Pico employs several metaphors to discuss literary *imitatio*, such as the one of the mosaics to define those Ciceronians that only use their master’s vocabulary to build sentences: for instance, they use Cicero’s bricks but are unable to create a *Tullianus paries* (Ciceronian wall). Furthermore, he employs the image of the cloak to describe the variety of tastes in Latin (Fantazzi 2014; McLaughlin 1995).

In his response, dated December 1512, Bembo acknowledges Pico’s affinity to Poliziano; thus he recognizes that the quarrel he is now involved with is a direct continuation of the debate between Poliziano and Cortesi. He begins his letter by criticizing Pico’s idea of an innate eloquence in the individual, because, for Bembo, it only exists in the mind of God. Moreover, he believes Cicero is the only model to follow and argues against eclectic imitation because the confluence of various literary manners in a single work is absurd and also it prevents the formation of a writer’s

individual style. Bembo believes imitation is not a mechanical act, but it is allied to emulation, which he defines as an active creative quality that can inspire an author to surpass the model (Della Neva 2007; Fantazzi 2014; Greene 1982; McLaughlin 1995).

He offers a tripartite structure when defining the imitative process as well as his development as a Latin writer, who will then become a Ciceronian. For instance, he states that imitation is divided into three steps: *imitari*, *assequi*, and *praeterire*. When describing the three phases of his writing career, he believes that, first, he was an eclectic until his lack of consistency in Latin convinced him to abandon that path. Second, he tried to develop an individual style but failed because *inventio* can never be original. Lastly, he decided to follow a single model of eloquence and style. He initially imitated mediocre authors and later realized that he could not transition to imitate the best models. In the epistle, Bembo then claims his lack of success in Latin is due to his work in the vernacular. In fact, he will later transfer the imitative principles of Latin language and style to the vernacular, and, in 1525, he will publish *Prose della Volgar Lingua* where Boccaccio and Petrarch serve as models for written *volgare* and function as the vernacular equivalents to Cicero and Vergil (Della Neva 2007; Fantazzi 2014; Greene 1982; McLaughlin 1995).

Despite their different views about imitative practices and models to follow, Bembo and Pico found an agreement in their interest in striving to actively surpass rather than passively follow the model. Pico claimed that all good authors have reached fame by other means than imitation; they rather have opposed their models and exceeded them. Similarly, Bembo believed that the final goal of a writer should be surpassing a model and that objective could be best accomplished by imitating only a single model (Pigman 1980).

Two decades after the Pico-Bembo debate, Giambattista Giralaldi Cinzio (1504–1573) and Celio Calcagnini (1479–1541) started a new dispute on the theories of Ciceronian imitation. Cinzio took Cortesi and Bembo’s stand in this quarrel and claimed the fundamental importance of imitating one model because he did not

believe in the self-sufficiency of one's *ingenium*. Significantly, he was not a strict Ciceronian and declared that a writer could benefit from the reading of various sources once he has developed an acceptable Ciceronian style. Different from what Bembo and Poliziano had claimed before him, he invited young writers in the early stages of their careers to read only the best authors and then later to widen their repertoire. In his response, Calcagnini agreed with Cinzio that imitation is necessary, especially for Humanist writers who did not speak and write in Latin since infancy and added that a writer should avoid using the vernacular because it could interfere with the development of an eloquent Latin style. Moreover, he criticized those writers who rely on their *ingenium* and do not understand the importance of imitation in the writing process. He also introduced the idea of inspiration, which he considered an ally to *imitation*, and that he defined as a genuine influence from other authors (Della Neva 2007).

The imitation debates continued to exist after 1530 in Italy and in Europe, but in the Italian context, the linguistic question of Latin versus the *volgare* had settled in favor of the latter. Therefore, Latin was not considered appropriate for creative writings anymore, and Italian was to be preferred by the majority of the authors of the period. Consequently, theoretical quarrels on *imitatio* and Latin style and eloquence tended to be largely confined to universities and academies (Della Neva 2007; McLaughlin 1995).

In conclusion, *imitatio*, originally a component in the process of developing a new writer, provides the basis for several important cultural moments in the early modern period. First, it functions as a crucial feature of the humanist enterprise to study and reproduce classical works, and it is considered as an essential component to restore classical Latin. Later, it helped consolidate the newer tradition of vernacular languages. In both cases, imitation first serves as a practical expedient for the production of an apparently appropriate style; as a consequence, imitation also forms the aesthetic basis by which works are judged, as adhering (or not adhering) to models, either as innovative or traditional.

Abstract

Immanence in Renaissance philosophy is primarily an epistemological category derived from a reading of Aristotle and the Medieval Aristotelian tradition. Immanent actions are considered operations of the soul which remain in the operating one itself and do not have a cause or effect on external matter. These immanent actions are distinguished from transient actions. The main issue for Renaissance philosophers involved determining which activities of the soul (nutrition, sensation, intellection, will) can be assessed as immanent. Immanence as a metaphysical category only emerged in the seventeenth century with Spinoza's concept of God as *causa immanens* and was later extrapolated by philosophy historians, who were influenced by the philosophy of the Enlightenment and by German idealism, on the description of two originally Neoplatonic ideas: (1) the intrinsicness of the world soul in the world as the immanence of the soul in the world in connection with

panpsychism and (2) the presence of the divine in the world as the immanence of God in the world in connection with pantheism.

Heritage and Rupture with the Tradition

The Immanence of the Soul's Activities

The meaning of the term “immanence” in Renaissance philosophy is dependent on Medieval Aristotelian tradition. Aristotle in *Metaphysics IX* (1050a 24–29) states that, “in some cases it is the exercise that is final (for example, seeing in the case of sight, and nothing different in addition to this comes to be from sight), but from others there does come to be something (for example, from the building craft a house in addition to the act of building)” (Aristotle 2006). Thomas Aquinas in reference to this passage distinguishes between immanent (*actio manens*, while later Scholastics such as John Duns Scotus use the term *actio immanens*) and transient action (*actio transiens*), where immanent means an action which remains in the one operating itself, while transient is properly “making,” for it passes through into exterior matter (George 2014). Within this Peripatetic tradition, Rudolph Goclenius defines *actiones immanentes* as actions in which a passive one, i.e., *subiectum*, is unchanged, and these operations remain “subjectively” in operating one (Goclenius 1613). The distinction between *actio immanens* and *actio transiens* was used not only by Aristotelian thinkers but was also common for non-Aristotelian philosophers, such as Giordano Bruno, who mentions it in both *Summa terminorum metaphysicorum* (Bruno 1989) and *De monade* (Bruno 2010).

Renaissance philosophers differ in their view as to which actions of the soul can be called immanent. It is unclear in Thomas Aquinas if all actions of the vegetative soul are immanent. Suárez maintains that all vital actions are not immanent, since generation and in addition certain other vital actions, such as eating, are apparently not immanent (Des Chene 2000). Suárez therefore distinguishes between two meanings of immanence. First, immanence in the strong sense

is an action whose term remains in the proximate power that was produced and which can never have been produced by any other subject. In this sense only intellection and will can be immanent. Second, immanence in the weak sense is an action whose term remains in the suppositum that acts. In this sense all vital motion, such as nutrition, growth, and local motions of animals, and natural motion of earth are immanent actions. In summary, sensitive and vegetative actions of the soul, although not all, and even certain natural actions are immanent (Lecón 2013). In opposition to immanence, which is characteristic of operations of growth and nutrition, intrinsicness is a more decisive criterion for sense, intellection, and will (Des Chene 1996).

Opponents of Suárez, such as Pedro da Fonseca, emphasized that immanent actions do not have *termini* – an effect outside the agent. Immanent actions are therefore not actions at all, but qualities of the faculty in which they are: cognition is a quality of intellection; desire is a quality of will (Des Chene 1996, 46). This view is based on the fifteenth-century Thomists, such as Thomas de Vio (Cajetan), who maintained that certain immanent actions of the soul (sensation) are operations only in a grammatical sense, since they are actually qualities (Spruit 2008). The immanence of sensation supports the view of sensation as an active power. If vision, as Zabarella argues, has its cause only in material color, it would be a transitive action. Sense power must therefore be both active and passive (South 2002).

The issue of the immanence of intellection became important in the context of the Averroistic doctrine of the unicity of intellect, if the agent of the intellection is the agent (active) intellect, which is not part of the human soul and is unique for all mankind. And if passive intellect, which becomes all things, is unique and transcendent, the question arises if intellection is still an immanent action of the soul. Pomponazzi, in the context of his critique of Averroism, points out that intellection is an immanent operation in contrast to locomotion, which is transient (Pomponazzi 1999). Simultaneously, at a different point, Pomponazzi considers intellection as an immanent action only in a grammatical sense

(Pomponazzi 2012). Zabarella concludes these discussions with the claim that every intellection is an immanent action, since intellect is *forma hominis*, otherwise one could not speak about humans as having understanding (Zabarella 2016).

It seems that in the Renaissance as well as in the Middle Ages, the word “immanence” was only used in the abovementioned epistemological context. Nevertheless, modern historians of Renaissance philosophy often apply “immanence” as a category interpreting certain metaphysical theories. These interpretations are connected first with the panpsychism, i.e., the immanence of the soul in the world, and second with pantheism, i.e., the immanence of God in the world.

The Immanence of the Soul in the World

The Platonic doctrine of the world soul contains features which lead to a modern exposition of the immanence of the soul in the world. Marsilio Ficino describes the relationship between the world and the world soul as between our body and our soul. The world soul is entirely present in any part of the world, and it binds the universe together, vivifies it, and moves it (Ficino 2001). In modern terminology it could be characterized as immanence although Ficino does not use this expression.

The immanence of the world soul in the world in this sense, i.e., not applying the word immanence, can be consequently found in a number of Renaissance Platonists, who followed Ficino’s works and his translations of Plato, Neoplatonist, and Hermetic corpus, such as Agrippa of Nettesheim. The doctrine of the world soul presents in all things, and vivifying them is a later feature of Giordano Bruno’s metaphysics. Bruno in the dialog *Della causa, principio e uno* distinguishes between the world soul and the universal intellect, which is a faculty intrinsic to the world soul. Bruno calls it an “internal artificer” because it forms matter shaping it from within (Bruno 2002). Thus, we can speak of an immanence of the universal intellect and the world soul in Bruno (Knox 2013). Bruno, however, does not speak explicitly about their “immanence” but

differentiates between intrinsic and extrinsic cause. The universal intellect is both extrinsic, for its essence differs from things which it creates, and intrinsic, since it works within matter and not outside it.

The Immanence of God in the World

The immanence of God is a doctrine only connected with Spinoza’s view of God as *causa immanens*, which is labeled as pantheism. The idea became popular during the Enlightenment and the subsequent nineteenth century within the so-called *Pantheismusstreit*. It was soon associated with Giordano Bruno’s metaphysics of his dialog *Della causa* in particular. The question as to whether Bruno held pantheism as the identity of God and the world in the same way as Spinoza is doubtful. It seems more likely that using the word pantheism as a label describing his philosophy is artificial (Kristeller 1964). Bruno speaks about God as both transcendent and immanent. In the *Lampas triginta statutorum*, he describes God as “above all things and inside all things,” i.e., as both extrinsic and intrinsic in things. Bruno uses the same words and expressions as in the case of his doctrine of the world soul and the universal intellect (Knox 2013). Similarly, however, to his doctrine of panpsychism, he does not apply the modern term immanence.

Simultaneous transcendence and immanence of the divine in the world (when using the modern terminology) is one of the central features of Neoplatonic tradition (such as Proclus) focusing on the issue of the relationship between the One and the number. It penetrates Christian thought inspired by Neoplatonism in the Middle Ages (Eriugena, Eckhart). Neoplatonic sources stand behind the immanence of the divine in Renaissance Platonists (O’Meara 1982), beginning with Nicolaus Cusanus who tried to solve the issue by means of a metaphor of enfolding and unfolding (Alfsvåg 2012; Flasch 1998). At the end of the Renaissance, apart from Bruno, the Neoplatonic transcendence and immanence of the divine can be extracted from Francesco Patrizi’s concept of God as *un-omnia* (One-All) as an all-pervading One, which is, but is not, identical with the world emanating gradually from the One and

participating in it (Brickman 1941). Patrizi also describes this relationship by means of traditional terminology enriched by his neologisms with the prefix pan-, not using the term immanence as a metaphysical category.

Impact and Legacy

In modern philosophy, immanence is commonly viewed as a concept derived from Kant's distinction between transcendence and immanence which led to the philosophy of immanence of German idealism and of its followers. Certain twentieth-century philosophers find, however, predecessors of modern immanence already in the Renaissance. Ernst Cassirer considers the first steps to immanence both Nicolaus of Cusa's doctrine on learned ignorance and Renaissance natural philosophy based on the immanence of Platonic ideas in the world (Cassirer 1922). Giovanni Gentile, although placing an emphasis on the modern origin of real immanence, praised Giordano Bruno as its precursor (Rubini 2014). Antonio Gramsci searched for the origins of Marx's materialistic immanence in Giordano Bruno via Spinoza and "Pantheismusstreit" and in Niccolò Machiavelli's immanence in history (Thomas 2009). The modern meaning of immanence as a metaphysical concept connected with idealistic philosophy is, however, alien to a primarily epistemological meaning, which the words immanence and immanent action had in the Renaissance.

Immortality of the Soul, Renaissance Problem of

Alexander Lee

Centre for the Study of the Renaissance,
University of Warwick, Warwick, UK

Abstract

The immortality of the soul was one of the central problems of Renaissance psychology. At its heart were two closely-connected problems. Was the soul a separable substance, capable of independent existence after corporeal death, or was it merely the abstract *form* of the body? If the former, could its immortality be proved philosophically, or did it have to be accepted on faith alone? Straddling the (often blurred) boundary between philosophy and theology, debates about these questions often trespassed into ontology and epistemology, but were shaped, above all, by the reception of the Platonic and Aristotelian traditions.

Heritage and Rupture with the Tradition

Until the thirteenth century, the Christian belief in the immortality of the soul had been refracted primarily through the lens of Platonic philosophy. In *Alcibiades* 1, Plato had defined man as “a soul using a body.” Developing this argument further

in the *Phaedo* and the *Republic*, he had explained that the soul was a spiritual substance, consisting of three parts (reason, spirit, and appetite). Although it gave life to the body, it was capable of existing independently, and, unlike material things, could never be destroyed (Lorenz 2019). Four arguments were adduced to prove its immortality. The first – known as the “affinity” argument – held that the soul was immortal because it most resembled intelligible, imperishable being; the second that the death of the body presupposed the continued existence of the soul; the third that the soul had life much like fire has heat; and the fourth that the soul was responsible not just for animating the body, but also for imbuing life with its distinctive characteristics (justice, happiness, etc.).

Plato's theory of soul had a profound influence on Augustine. Although, in his youth, Augustine had adhered to the Manichaean view of the soul as a material entity, he later came to describe it as an immaterial substance which was fitted to ruling over the body, but which could nevertheless exist separately and for all time (e.g., Augustine 1954, 19.15; 1986, *De quantitate animae*. 22). In the *Soliloquia*, he attempted to prove its immortality by offering an alternative formulation of Plato's fourth argument. Since truth is not only eternal and unchanging, but also contained within the soul, Augustine argued, it followed that the soul, too, must exist for all time. Perhaps conscious of the limitations of this line of reasoning, however, Augustine subsequently repudiated it, preferring merely to repeat the contention that true happiness depended upon the immortality of the soul (Augustine 1968, 13.9.12). Such a view became a commonplace of later Christian theology and moral philosophy.

The rediscovery and translation of the Aristotelian corpus, however, transformed Christian thinking. In *De anima*, Aristotle had argued that the soul – consisting of nutritive, sensitive, and intellective parts – was not a substance at all, but the *form* of the body (Frede 1992). For Christian readers, this presented a problem. If the soul was indeed a form, then it could have no separate existence. Although an awkwardly worded passage (*De anima* 3.5) held out the possibility that

the intellective soul might endure, this implied that, when the body died, the soul also perished – which they could clearly not accept.

One solution was proposed by St. Thomas Aquinas (1225–1274). In the *Summa Theologiae*, Aquinas argued that the soul was both immaterial form and substance (Kenny 1993; Kretzmann 1993). As Aristotle had suggested, it was the actuality of the body; but, since its intellective functions could operate “apart from the body,” it was also self-subsistent – and hence did not depend on the body for its existence (Aquinas 1948–1950, I, q. 75, a. 2). That it was immortal could, moreover, be proved by philosophical means. Corruption, Aquinas argued, occurred when something was separated from its existence. Being a self-subsistent *form*, the soul existed *per se*; and, since it could not be separated from itself, could neither be corrupted nor die (Aquinas 1948–1950, I, q. 75, a. 6).

An alternative solution took inspiration from the writings of Alexander of Aphrodisias (*fl.* 200) and Averroes (1126–1198). Exploiting the ambiguities of *De anima* 3.5, these two philosophers had argued that, while personal immortality was impossible, the intellective soul could nevertheless attain the eternal to one degree or another. Each had adopted a different approach. Alexander had argued that, while the “potential” (human) intellect was inseparable from the body and hence mortal, it could nevertheless partake in the immortality of God when it apprehended the “active” (divine) intellect (Alexander of Aphrodisias 1549; Kessler 2011). Averroes, by contrast, was more daring. Since the intellect perceived material things as intelligible forms, he argued, it had to be both incorporeal and immortal; but since nothing incorporeal could be multiplied or divided, there could only be *one* intellective soul – for all humanity (Averroes 1953; Leaman 1988, 82–119).

Such views proved controversial. The earliest exponents of Latin Averroism at the University of Paris, Siger of Brabant and Boethius of Dacia, were condemned by the bishop, Etienne Tempier, in 1270 and 1277. Yet the teachings of Averroes and Alexander nevertheless received an enthusiastic welcome, particularly at Italian *studia*. Taddeo of Parma (*fl.* 1320), Paul of Venice

(1369/1372–1429) and Niccolò Tignosi (1402–1474) – to name but three – all argued forcefully for the unicity of the immortal intellect.

Marsilio Ficino. Until the mid-fifteenth century, Platonic and Aristotelian traditions had existed more or less in isolation from one another; but after the opening of the Council of Florence (1439), the two were suddenly brought into conflict. The opening shot was fired by the Byzantine Platonist, Georgios Gemistus Pletho (c. 1355/1360–c. 1452/1454). In *De differentiis* – a compendious work intended to correct the “errors” of Aristotle – he attacked the Stagirite’s theory of soul, on the grounds that it had led Alexander of Aphrodisias into heresy (Pletho 1973). This was soon followed by vehement rebuttals from Gennadius Scholarius (c. 1400–c. 1473) and George of Trebizond (1395–1472/3), and an equally violent counter-attack from Cardinal Bessarion (1403–1472). Not until the completion of Marsilio Ficino’s *Theologia Platonica* (1482), however, was a through defence of Platonic psychology attempted (Kristeller 1940; Blum 2007, 213–217; Casini 2018, 232–235). Like Plato, Ficino insisted on the intermediate nature of the soul. Though it co-operated with the body in the operation of its faculties, it remained distinct and was hence capable of existing independently. Rejecting Averroes’ belief in a single potential intellect for all humanity, on the grounds that it ran contrary to the order of nature (Ficino 2001–2006, 15.4.4), he argued strongly for personal immortality. This he justified using two principle arguments, each based on an imaginative re-reading of Plato: one from “affinity” (e.g., Ficino 2001–2006, 11.1), the other from “natural desire” (e.g., Ficino 2001–2006, 14.2). According to the latter, the soul had a natural desire for the eternal; and since nothing was created with an appetite that it could not satisfy, it followed that it must be immortal.

Nicoletto Vernia. A few years after Ficino’s defence of Platonic psychology, an attempt was made to rescue Aristotle from Latin Averroism by Nicoletto Vernia (1420–1499). Although, in his youth, he had been convinced that Averroes had been the only true interpreter of Aristotle, he renounced his affection in favour of closer dependence on the commentaries of Themistius and

Simplicius after Bishop Pietro Barozzi of Padua issued a decree forbidding discussion of the unicity of the intellect in 1489 (Nardi 1958, 99–101; Di Napoli 1963, 181–193; Mahoney 1976; Hasse 2004). In *Contra perversam Averrois opinionem*, Vernia argued that Averroes' theory of a single potential intellect could not be true, since, if it were, the soul could not give human beings existence. Much like Aquinas, he then went on to contend that the intellectual soul is a substantial form, which serves as the actuality of the body, but which is nevertheless capable of independent – and immortal – existence. Attributing this latter view directly to Aristotle, Vernia justified it using a series of arguments taken from Albert the Great's *De homine* (Mahoney 1976, 156).

Pietro Pomponazzi. The promulgation of the bull *Apostolici regiminis* at the Fifth Lateran Council (1513) was an effort to settle the dispute once and for all. The teaching of Averroes and Alexander was forbidden; the soul was declared to be the essential form of the body, immortal, and distinct for each individual; and the notion that religious and philosophical truth might have separate domains was condemned (Offelli 1954–1955; Gilbert 1967; Constant 2002).

Rather than quench the fires of controversy, however, the bull only fanned the flames further. Three years later, Pietro Pomponazzi (1462–1525) published *De immortalitate animae* (1516). In this, Pomponazzi argued that, whereas the sensitive and nutritive souls were dependent on the body and hence mortal, the position of the intellectual soul was more complex (Di Napoli 1963, 227–276; Kessler 1988, 500–504; Casini 2007, 2018, 235–239). As Aristotle had noted, the intellect could only function through abstraction. Since it was not a part of the body, it could not perceive things directly, but relied instead on *phantasma*. Since these were ultimately derived from sensory data, however, the intellect was thus dependent on the body for its operation – even when it was contemplating itself. Although Pomponazzi recognised that the intellect was, in a certain sense, still abstract and immaterial, he hence found it impossible to sustain Aquinas' contention that the soul was self-subsistent. He was thus forced to conclude that, while the

immortality of the soul was admirably attested by Scripture and certain philosophers, it was a philosophically irresolvable problem.

Gasparo Contarini and Agostino Nifo. Despite Pomponazzi's qualifications, his treatise was widely regarded as an attack on the immortality of the soul and elicited a torrent of refutations from both Platonists and Aristotelians. Of these, two stand out. The first came from Pomponazzi's former student, Gasparo Contarini (1483–1535). Drawing heavily on Plato, Contarini argued that, while the intellect was indeed reliant on the senses, it was nevertheless far from being merely material; and that the soul's capacity to move itself was a clear indication of immortality (Contarini 1578; Di Napoli 1963, 277–298; Gleason 1993, 77–82). The second challenge came from Vernia's pupil, Agostino Nifo (1469/1470–1538). Adopting a subtly different approach to that of his teacher, Nifo began by observing that, according to Aristotle, the soul, being incapable of existence apart from the body, was indeed mortal (Nifo 1518, 1559; Mahoney 1968). But he then confounded expectations by postulating that, since the faculty of cognition could, in theory, still function if separated from the body – that is, without receiving any additional *phantasma* – the intellect was capable of living on.

Impact and Legacy

Renaissance debates about the immortality of the soul were never satisfactorily resolved. In one form or another, the controversy rumbled on with wearying insistence throughout the sixteenth century in the writings of Gianfrancesco Pico della Mirandola (1469–1533), Giovanni Crisostomo Javelli (c. 1470–1538), Juan Luis Vives (1493–1540), and Agostino Steuco (1497/1498–1548), amongst others. Yet its legacy was nevertheless positive. For while the soul's nature remained as mysterious as ever, the fruitless quest for a solution bequeathed to future generations a keener awareness both of the issues at stake, and of the philosophical methods which could be used to tackle them. And though no greater certainty was to be acquired in centuries to come, this

clarity of focus and method paved the way not only for the metaphysical speculations of Francisco Suárez (1548–1617), but also for the ultimately inconclusive meditations of René Descartes (1596–1650).

Impetus, Renaissance Concept of

Maarten Van Dyck¹ and Ivan Malara²

¹Department of Philosophy and Moral Science, Ghent University, Ghent, Belgium

²Department of Philosophy, University of Milan, Milan, Italy

Abstract

The concept of impetus denoted the transmission of a power from the mover to the object moved. Many authors resorted to this concept

to explain why a projectile keeps on moving when no longer in contact with its initial mover. But its application went further, as impetus was also appealed to in attempts to explain the acceleration of falling bodies or the motion of the heavens. It was widely applied in Renaissance natural philosophy, but it also raised a number of ontological questions concerning its precise nature.

Introduction

First formulated in late antiquity, the concept of impetus denoted the transmission of a power, a force (*vis impressa*), or a motive quality, from the mover to the object moved. Many authors resorted to this concept to explain why a projectile keeps on moving when no longer in contact with its initial mover. But its application went further, as impetus was also appealed to in attempts to explain the acceleration of falling bodies or the motion of the heavens.

Ever since Pierre Duhem drew attention to the importance of the concept for scholastic natural philosophy, it has occupied a central role in historiographic debates on the roots of the scientific revolution (Duhem 1906). Anneliese Maier's seminal studies convincingly demonstrated the difference separating the scholastic concept of impetus from Newtonian inertia (see especially Maier 1982), but it could still be seen as the starting point for a revolution that marked the distance from Aristotle and led to Copernicus and Galileo (Blumenberg 1975; Koyré 1939). In general, two opposing views can be singled out (with many options in between): (1) on the one hand, the concept of impetus is conceived as central to a specific, non-Aristotelian manner of understanding the causal order of nature, which starts with Philoponus and lasts until Galileo and Descartes (Wolff 1978); (2) on the other hand, it has been claimed that a single shared concept of impetus does not exist, that there is rather an array of different and mostly ad hoc attempts to solve natural philosophical problems within the Aristotelian tradition by resorting to impetus (Sarnowsky 2008). Rather than trying to endorse

one of these views, in what follows we will recall and put in context some of the main views on impetus and their fate in the Renaissance.

Heritage

Aristotle

Aristotle only dealt with projectile motion in passing, when discussing other matters: the question of motion in the void (*Physics* IV.8), the manner in which the first mover causes the eternal motion of the heavens (*Physics* VIII.10), and the existence of natural motions (*On the Heavens* III.2). Even if it was only peripheral to his main interests, Aristotle still needed to offer an explanation for its continuing motion that was consistent with the rest of his natural philosophy. The crucial constraints were the principles that scholastic philosophy would translate as *omne quod movetur ab alio movetur*, meaning that everything that is moved is moved by another, and *movens et motum sunt simul*, according to which the mover of a body must be in contact with the latter to generate motion. Aristotle preferred the explanation according to which the projected body is moved by the surrounding air once it has left the hand of the projector. The air is not simply put into motion together with the body, but it also acquires a moving force which it then imparts both to the body and to neighboring parts of the air. This process is repeated until the force is completely exhausted (Sarnowsky 2008, pp. 123–124). As careful medieval and renaissance readers would later point out, this can be taken to imply that Aristotle did not doubt the idea of an impressed force, but primarily disagreed on its localization (Maier 1940).

There is another place in the Aristotelian corpus where projectile motion is discussed, although in very inconclusive terms: questions 32–34 of the *Mechanical Questions* (Anders 2013) argues that these show that Aristotle or his immediate pupils were not completely satisfied with the account offered in the *Physics* and *On the Heavens*. It was only in the Renaissance that these passages would be linked to the concept of impetus (first by Alessandro Piccolomini and later

by commentators such as Bernardino Baldi (Baldi 2010, pp. 363, 365, 414–417).

Late Antiquity and Arab Philosophy

The first occurrence of the concept of impetus can be found in sixth-century commentaries devoted to Aristotle's *On the Heavens* and *Physics*. Since the beginning, it was not only exploited to explain the continuation of projectile motion but also to describe the acceleration of falling bodies as well as the motion of the heavens.

Simplicius (490–560), in his commentary on *On the Heavens*, said that according to Hipparchus (an astronomer of the second century BC), a piece of earth that is thrown upwards continues its upward motion as long as the force impressed in it by the thrower is able to counteract the natural inclination to fall. When it starts to fall down, the earth still retains part of the impressed force, which gradually diminishes until it has completely disappeared, giving rise to the phenomenon of acceleration (Sorabij 2005, p. 349).

Another commentator, John Philoponus (490–570), opposed Aristotle on the explanation of projectile motion. In his view, the motive force is transmitted directly from the mover to the body moved. As a result, Philoponus held forced motion in the void to be possible, but he claimed that the impressed force will be extinguished after some time (Wolff 2010, p. 130). Philoponus also stated that God implanted a motive power in the heavenly bodies in the same way that he implanted in the elementary bodies an inclination to move towards their proper places. Impetus is thus extended by Philoponus to the heavenly realm (Sorabij 2005, pp. 351–355).

It is very likely that the Arab philosophers became acquainted with Philoponus' theory of impetus (Clagett 1959, pp. 510–514). Avicenna, who was probably the most influential author, identified three kinds of inclination (*mayl*): (1) psychic (*mayl nafsānī*); (2) natural (*mayl tabī'ī*); (3) unnatural or violent (*mayl qasrī*). The third genre of *mayl* intervenes when a body is thrown by force. For Avicenna, there cannot be more than one *mayl* in the same body at the same time. In this regard, his theory of impetus differs from the one Simplicius ascribed to Hipparchus. It

differs also from Philoponus' view, for Avicenna holds that the *mayl* would last indefinitely if there were no medium opposing resistance. This seems to have been intended in the first place to show the nonexistence of the void, since he also adds that this infinite motion does not occur in nature (Clagett 1959, p. 513).

Medieval Scholasticism

Philoponus had already highlighted the empirical implausibility of the role that Aristotle assigned to the medium. Still, there were good reasons within Aristotle's natural philosophy to defend this explanation, as stressed by Thomas of Aquinas (1225–1274). According to Thomas, the projectile cannot receive an intrinsic principle of motion: if this was the case, then the projectile motion would become natural rather than violent (Clagett 1959, pp. 516–517; Weisheipl 1981).

The introduction of the impetus concept in scholastic philosophy is traditionally ascribed to Francis of Marchia (first half of fourteenth century), who held the Franciscan chair of theology in Paris, but recent scholarship has shown that there were some thirteenth-century predecessors (Schabel 2006). Marchia's much more extensive discussion appears in his commentary on the *Sentences* when treating the question of sacramental causality: should we assume that there is some kind of instrumental force present in the sacrament, or does God work directly? In discussing the general problem of instrumental causality, he introduced the example of projectile motion as a crucial example, appealing to the idea that a *virtus derelicta* is left behind in the body (Maier 1940, pp. 45–77). Marchia also tried to determine to what kind of quality this *virtus* belongs, qualifying it as a form that is “not simply permanent, nor simply fluent, but almost medial,” staying for some time in the body, but then fading away (Clagett 1959, p. 529). Clearly, he tried to circumvent the worry raised by Thomas by assigning the impressed force an ontological category of its own. In a further comment, Marchia suggested that this same *virtus* could also be used to explain how the angelic intelligences move the celestial spheres (Maier 1940, pp. 67–73).

Jean Buridan (1295–1363) formulated what has been called the “classical” concept of impetus (Sarnowsky 2008, p. 134). He quoted several empirical reasons to support the concept of impetus and he also gave some proportional indications about how it relates to factors such as the amount of matter that is put into motion (Clagett 1959, pp. 521–523). Contrary to Marchia, he claimed that the impetus was “a thing of permanent nature” (Clagett 1959, p. 537). His main reason for making this claim seem to have been the need to sharply distinguish the impetus from the motion it caused (Maier 1982, pp. 86–87). The difference with Marchia's self-expending impetus had no real natural philosophical consequences, since Buridan assumed that all earthly bodies have an intrinsic tendency towards rest, which will gradually destroy the impetus and cause all violent motion to come to an end (see especially Maier 1982, pp. 89–95). Just as Marchia, Buridan also appealed to impetus in treating celestial motion, and he added acceleration as a further phenomenon that could be explained by it (Clagett 1959, pp. 524–525). In the latter case, impetus is not only the cause but also the effect of motion, as Buridan assumed that the body gradually acquires more impetus as it falls. Buridan's direct successors, Nicole Oresme (1320–1382), Albert of Saxony (1320–1390), and Marsilius of Inghen (1340–1396), further took up the concept and offered treatments that afterwards spread over Europe from Paris (Maier 1940, pp. 100–153; Sarnowsky 2008, pp. 136–137).

Innovation

Impetus as Aristotelian Doctrine

The sixteenth century saw an increased attention to the concept of impetus after a relative stagnation in the preceding century. It now came to be seen as part of the proper “Aristotelian” position, with many authors going as far as ascribing the idea to Aristotle himself (Maier 1940, p. 156). They could exploit the fact that Aristotle had used the idea of impressed force, while explaining away his limitation to the medium as carrier of the force (see Maier 1940, pp. 156–164, for

examples, including Domingo de Soto and Francisco Suarez). The idea that the impetus was present both in the medium and the projectile, a position already held by Marchia, was also regularly defended by authors who did not ascribe this idea directly to Aristotle (e.g., the Coimbra commentators: Maier 1940, p. 163). Notwithstanding its popularity, there were also some sixteenth century authors who denied the legitimacy of the concept of impetus, maybe most prominently the Jesuit Benedict Pereira in his *De communibus omnium rerum naturalium principiis* from 1576 (Maier 1981, p. 325).

Almost all authors seem to have upheld the idea that impetus was a self-expending quality, but its precise ontological status received further subtle elaborations, e.g., in the work of the professors of the Jesuit *Collegio Romano* (Maier 1981). Among the latter, the fullest exposition was given by Paulus Valla, whose characterization of impetus was summarized by Anneliese Maier as “an imperfect quality after the fashion of an intensional or spiritual form, somewhat like light and color, and as such has no contrary in first act although it has a contrary in second act” (Maier 1981, p. 331). The analogy with light and color was already present in Philoponus and Marchia and helped understand its peculiar ontological status as a cause of motion that is not natural but need not be directed against the object’s nature either (Sorabij 2005, p. 352; Zanin 2006, p. 93).

Thomist philosophers proposed another elaboration which consisted in the articulation of the relation between the role of gravity in natural motion and that of impetus in violent motion. Thomas had already denied that gravity was the mover of the natural motion and had claimed that it should rather be considered the instrument of the true mover, which was the generator of the body (Weisheipl 1981). Similarly, one could understand the impetus as in the first place a passive instrument of the proper efficient cause, the projector (cf. de Soto in Maier 1940, p. 163). This line of thought can be seen as a rather natural development of Marchia’s introduction of the impetus concept in the context of discussing the nature of instrumental causality. Suarez, who

offered an elaborate classification of instruments, characterized impetus as an instrument that is neither spatially nor causally in conjunction with its user, meaning that it operates without direct spatial contact and without the need for the user to continue exerting his force (Fritsche 2011, 23–24).

Impetus in Anti-Aristotelian Natural Philosophy

In the same period that impetus became to be widely seen as part of the accepted Aristotelian doctrine, it was also used as a central element in attempts at constructing an alternative anti-Aristotelian natural philosophy. The most famous examples are Benedetti’s *Diversarum speculationum mathematicarum et physicarum liber* (1585) and Galileo’s *De motu antiquiora* (probably written between 1589 and 1592) (Drake and Drabkin 1969). Both authors developed a general framework based on Archimedean hydrostatics that did away with the Aristotelian concept of lightness and stressed the absolute nature of gravity. They were also keen on pointing out that Aristotle’s own “theory” of projectile motions was defective and they stressed the need to correct him by introducing an impressed force. In this way impetus became associated with a more far-reaching attempt to rethink Aristotelean natural philosophy. Galileo’s original explanation of *virtus impressa* as a *privatio gravitatis* further stressed its relation to the Archimedean framework that privileged gravity as the primary physical property of bodies. Galileo also followed Hipparchus’ explanation of acceleration due to a gradual loss of an earlier impressed force. The Latin translation of Simplicius’ commentary on *De Caelo* (Venice, 1584) had made this explanation widely available, and it was also reported in Perera’s *De communibus* from 1576, a work that had vast circulation in Italy (Guerrini 2014).

One striking difference between Benedetti’s and Galileo’s way of talking about impetus and that of their Aristotelian contemporaries is the almost complete disappearance of ontological subtleties. Many of the earlier discussions concerning impetus were trying to carve out an acceptable place for it within the Aristotelian framework which imposed many constraints and

ensuing challenges. For these explicitly anti-Aristotelian authors, it could function in the first place as an intuitive notion that could be directly appealed to explain a number of phenomena of motion.

Legacy

Seventeenth century authors frequently engaged in talk about impetus, but this covered a wide array of meanings.

Galileo kept on using the term after *De motu antiquiora*, but he seemed to use it in a way that is at least noncommittal to the question whether it is a cause or only an effect of motion (Koyré 1939). The tendency to transfer the term from denoting a cause to an effect can be noticed throughout the seventeenth and into the eighteenth century (Sarnowsky 2008, pp. 142–143). This shift is connected to the development of a form of mathematical physics in the Galilean tradition in which conservation of motion became one of the crucial principles. The challenges of finding mathematical structure in empirical phenomena of motion, such as falling or projected bodies, pointed towards the fruitfulness of assuming this conservation as a basic fact of nature, which thus did not necessarily need further explanation (Van Dyck 2018).

In parallel with these developments within what was sometimes called physicomathematics, some philosophers were also directly rethinking the ontology of motion and force. Most famous was Descartes' sparse ontology in which motion becomes a state of a body that does not need a cause for its perseverance. The questions concerning the relation between motion and force that had given rise to the inclusion of impetus within the Aristotelian framework thus received very different answers in this radical alternative (Koyré 1939).

Whereas an author like Galileo exploited the flexibility of the term impetus to explore different ways to establish mathematical laws of motion, and Descartes presented an alternative ontological framework in which it no longer could find a place, authors within the Aristotelian tradition

kept using and rethinking the concept as developed in scholastic philosophy. Maybe the most striking case is that of the Jesuit Honoré Fabri. In response to the work of both Descartes and Galileo, he attempted to find a place for some of their new ideas within the constraints of (a very broadly construed) Aristotelian philosophy, in which he gave the concept of impetus an absolutely central place but reconceived it as a formal rather than efficient or instrumental cause of motion (Elazar 2011).

Index of Prohibited Books

Federico Barbierato

University of Verona, Verona, Italy

Abstract

The *Index of Prohibited Books* was one of the main instruments through which institutions – primarily the Church of Rome – sought to implement a widespread censorship and prevent printing, selling, reading, and simple possession of books deemed to be dangerous for the faith or morals. While the first official Roman *Index* dates to 1559, the idea of compiling lists of books to avoid or prohibit was not new. The Roman *Indices Librorum Prohibitorum* in force from 1559 to 1966 had a deep historical importance. They were not exclusively lists of prohibited works: they contained both the ecclesiastical legislation on censorship and the rules for the prohibition of books, and the lists, which constituted the second and most substantial part of the regulations entitled *Index Librorum Prohibitorum*. It should be emphasized that the validity of the *Indices Librorum Prohibitorum* – despite the universal intentions – was defined on a territorial basis and was linked to acceptance or not of the list by the governments of individual states. In fact, despite being calling universal and the weight of moral condemnation they represented being widely perceived, from the legal point of view their validity was in substance almost limited to the Italian territory only: even in Catholic Europe, France never received them, while Spain and Portugal – despite considering them – drew up their own tools with the help of their national Inquisitions. The last edition of the *Index laws* was published in 1948, and on 14 June 1966 the *Index* itself was abolished.

History and Original Aspects

The *Index of Prohibited Books* was one of the main instruments through which institutions –

primarily the Church of Rome – sought to implement a widespread censorship and prevent printing, selling, reading, and simple possession of books deemed to be dangerous for the faith or morals. While the first official Roman *Index Librorum Prohibitorum* dates to 1559, the idea of compiling lists of books to avoid or prohibit was not new. As early as 405 a.d. Pope Innocent I listed a number of apocryphal writings *non solum repudianda sed etiam damnanda*, and in 496 Gelasius I issued a decree that contained far more extensive lists of recommended and prohibited books. With the invention of the printing press, the situation changed, and the advent of the Reformation after 1517 required new and more refined tools to combat the Lutheran threat, considered a plague whose epidemic spread was due to books. To counter it Church authorities acted, but universities and the secular power also intervened decisively. If Rome decreed in 1521, the burning of all Luther's books following the condemnations expressed by the universities of Leuven, Cologne, and Paris, precisely from the latter university came, in 1544, the first printed *Index Librorum Prohibitorum*. It contained a list of 230 books in Latin and French, which gradually increased in the next six editions, until 1550. The last, in 1556, contained 528 forbidden texts, mostly theological treatises or in any case works related to the Reformation. Three more catalogues were issued by the University of Leuven on the orders of Charles V and Philip II, in the years 1546, 1550, and 1558, condemning some 500 works of Lutheran orientation, particularly small volumes intended for popular reading. Meanwhile similar *Index Librorum Prohibitorum* had been published in Portugal (in 1547 and in 1551) and Spain (in 1551). On the whole they roughly followed Leuven catalogues, to which – in the case of Portugal – they added a substantial amount of works from Conrad Gesner's *Bibliotheca Universalis*, a vast and comfortable repertoire, given the unfeasibility of inspecting all the works.

The main directives of the Catholic censorship that would mark the following centuries, therefore, were produced in the sixteenth century. The first *Index Librorum Prohibitorum* to

be published in Italy was the Venetian one of 1549, the work of the nuncio Della Casa and the result of collaboration with the local inquisitor and the *Savi all'Eresia* – a Venetian secular judiciary that flanked and controlled the work of the inquisitor in the Holy Office. The catalogue comprised 150 interdictions, 50 of which concerned the entire production of an author. Although commissioned by the Venetian government, it was immediately withdrawn because of the strong opposition from printers and booksellers – as well as from the Senate – toward an instrument that would lead to substantial limitations in the book trade. In 1554 in Venice itself, and also in Milan and Florence, a far larger *Index Librorum Prohibitorum* was issued, which in the Venetian version counted 600 prohibitions, mostly coming from the Roman curia. More than half concerned the entire production of an author, for the rest it was individual works, either anonymous or identified. This too was short-lived, and in 1555 its publication was annulled.

Such works – local initiatives not claiming universality – responded to the practical need to rely on repositories as complete as possible in which to immediately identify a forbidden text. On the other hand, the Roman *Indices Librorum Prohibitorum* in force from 1559 to 1666 gained much more depth and historical importance. They were not exclusively lists of prohibited works: they contained both the ecclesiastical legislation on censorship and the rules for the prohibition of books, and the lists, which constituted the second and most substantial part of the regulations entitled *Index Librorum Prohibitorum*. It should be emphasized that the validity of the *Indices Librorum Prohibitorum* – despite the universal intentions – was defined on a territorial basis and was linked to acceptance or not of the list by the governments of individual states. In fact, despite being calling universal and the weight of moral condemnation they represented being widely perceived, from the legal point of view their validity was in substance almost limited to the Italian territory only: even in Catholic Europe, France never received them, while Spain and Portugal – despite considering them – drew up their

own tools with the help of their national Inquisitions.

The first universal *Index Librorum Prohibitorum* was promulgated in 1559 (actually on 30 December 1558), although in 1557 it had come out in a sort of printed anticipation, which never circulated. It was the result of a decade of work by the Roman Inquisition and of the determined repressive will of the rigorous former inquisitor Pope Paul IV. Convictions – 1107 in all – were harsh, according to a criterion of division of forbidden books in 3 classes that would remain in place until the middle of the next century: the first collected the entire production of 603 non-Catholic authors (or no longer so) even if the individual works did not include references to religion nor elements that, by themselves, would have provoked condemnation. The second class consisted of 126 titles by 117 authors and 332 anonymous works. It was followed by two appendices: a list of 45 Bibles and New Testaments prohibited and 61 printers – all foreigners with the exception of the Brucioli brothers, active in Venice – whose output was prohibited in its entirety. Lastly, the third class was about *libri omnes*, that is, fulminated cumulative condemnations to entire categories of books: those that did not bear on the title page either the author's or the printer's name or generally typographical notes, those published without permission of ecclesiastical authority, and those published by heretic printers. Also all the works of magic and astrology, as well as vernacular Bibles, the reading of which was subject to a special license granted by the Holy Office, and in any case not to women or to those who could not read Latin. The action against the vernacular Bible had precedents in the prohibitions implemented in Spain in 1492 – also valid in the whole of southern Italy – and in France in 1526. However, the official acceptance within the Roman *Index Librorum Prohibitorum* started a controversial debate, which marked the second half of the sixteenth century and led to the disappearance of vernacular Bibles from the list of permitted readings, at least on Italian and Spanish soil. They would reappear only in 1758, thanks to Pope Benedict XIV.

Prohibitions, however, did not only concern works of religious or doctrinal matter but invested all written production, of which the Inquisition became sole judge, since the secular authorization was losing importance. So Aretino and Rabelais could be condemned for their obscenity, Machiavelli for anticurialism, the *Decameron* as immoral, and so on with Pulci, Della Casa, and much of the sixteenth-century vernacular production, especially burlesque. Ultimately, any work that could somehow arouse intellectual restlessness or offend morality was identified as dangerous, even though only 2 years earlier, in 1557, the same uncompromising future Pope Michele Ghislieri had written: “to prohibit Orlando, Orlandino and Cento Novelle [respectively Boiardo and Ariosto, Folengo, Boccaccio] and other similar books would provoke laughter more than anything else, because such books are not read as things to which you should believe, but rather as fables, in the way one also reads many pagan books.” The consequences of this blockade of vernacular, and in particular popular, literature were enormous. The reaction of booksellers, writers, and governments was deceive and even led to riots and damage to the headquarters of the Inquisition. While locally some inquisitors decided to suspend its application, in Rome in the same 1559 and then in 1561, two decrees of the Holy Office intervened to mitigate the extent of the prohibitions. Thus the *Index Librorum Prohibitorum* in the Italian territory was accepted, albeit with partial adjustments and sometimes after bitter tensions that took place mainly in the Venetian land. However, once Paul IV died in August of the same 1559, the application of the catalogue was quietly abandoned. The more moderate Pius IV – Gian Angelo de' Medici – immediately showed his intention to review it and to limit condemnations only to heretical books, as well as to contain the Holy Office.

In 1564 the Tridentine *Index Librorum Prohibitorum* was promulgated, drafted by a committee of bishops appointed within the Council of Trent. The new instrument was characterized by some mildness: although the prohibitions remained more or less the same, the overall

picture changed, and ten prohibition rules were established. These would essentially characterize the Catholic censorship for the next four centuries; only in 1897 they replaced by Pope Leo XIII's constitution *Officiorum ac munerum*. All heretical or superstitious texts had to be prohibited, together with obscene books – with the exception of ancient classics – and all New Testament editions made by heretics. While the division into three classes remained, some authors, including Erasmus, passed from the first to the second, that is, no longer banned for their full work but only for particular writings. Even the condemnation of heretic authors only hits the works of religious character and faith and no longer indiscriminately all of them. Complete prohibition was reserved, however, to heresiarchs. The reading of vernacular Bibles was still permitted under license, which now could also be issued to women and to those who could not read Latin. The vernacular works of controversy could be authorized at the discretion of the bishop or inquisitor, and also translations of Catholic or not prohibited authors made by heretics could circulate, provided that they did not contain anything against Catholic doctrine. Booksellers should not sell anyone this kind of material, or rather, they would have to constantly update a list of books for sale, in order to ensure a rapid and complete control. Also, the possibility of partial expurgation was contemplated for some texts to allow them free circulation again, and the provisions of the Fifth Lateran Council of 1515 on the need for prior censorship reiterated. The attempt to limit the inquisitorial initiative by grading it at the same level as that of the bishops was to be interpreted in the spirit of the Fifth Lateran Council. The punishment for those who read or possessed forbidden works of heretical character or suspected of heresy was excommunication. If it was a book forbidden for other reasons, however, the sentence was to be determined at the discretion of the bishop.

Because of the flexibility it demonstrated, the *Index Librorum Prohibitorum* was accepted without major reserves by Italian states and, if anything, made more strict in Portugal, in Bavaria, and in the Spanish Netherlands, while in France

during the Wars of Religion, like the other Tridentine decrees, it was not applied. In Spain, where the Inquisition was autonomous from the Roman one, a few months after the promulgation of the Roman *Index Librorum Prohibitorum*, a considerably different list of banned books was issued. About 700 sentences, divided by language, which essentially reinstated the Louvain, Paris, and Portuguese *Index Librorum Prohibitorum* for the works in Latin, French, Portuguese, German, and Flemish, while for the Castilian section 175 prohibitions were the result of an autonomous work of the Spanish Inquisition, which especially hit texts of devotion and works of mystics, of Erasmus, and related to superstitious practices. Subsequent Spanish *Indices Librorum Prohibitorum* would maintain these characteristics, as well as a much greater propensity than that demonstrated in Rome for textual expurgation.

The Tridentine *Index Librorum Prohibitorum* was reprinted several times and formally remained in force until 1596, although its application often lacked interest and certainly uniformity. However since 1565, with the election of Pius V, the situation changed. The new pope, Michele Ghislieri, had been commissioner general of the Congregation of the Holy Office and was also involved in the drafting of *Index Librorum Prohibitorum* of 1559. The rapprochement to that spirit was already marked in 1567 by the definitive prohibition of the printing of editions of the vernacular Bible, temporarily resumed after the Council. A new tool that recovered and possibly exceeded the severity of that of 1559, or at least was adjourned, looked increasingly in need. From this perspective the inquisitors of Parma (in 1580) and other cities (between 1574 and 1587) had compiled catalogues for their own use; the Archbishop of Naples had done so in 1583. In 1571 a special congregation was instituted by Pope Pius V, in order to draft a new catalogue. The following year the Congregation of the Index was formalized, and in 1596 Clement VIII could promulgate the new *Index Librorum Prohibitorum*, probably the most substantial effort deployed by Rome to fight the spread of books deemed dangerous. Unlike the previous

two, the first compiled by the Inquisition and the second by a special congregation of bishops appointed by the Council of Trent, the Clementine catalogue was the result of the labors of the newly established congregation, at first assisted by the Holy Office and by the Master of the Sacred Palace. The Congregation had worked at it among many contrasts for 25 years, taking into account the experience of half a century of censoring practice, and had had unsuccessful anticipations. Two other already printed *Indices Librorum Prohibitorum* were in fact withdrawn shortly before the promulgation, possibly because of disagreements with the Holy Office: the Sistine of 1590 and the Sixto-Clementine of 1593. The Clementine of 1596 too was temporarily suspended in 1596 after promulgation, due to the inquisitorial intervention. Likewise, its acceptance was opposed by some states, particularly by Savoy and Venice. In particular in the territories of the Republic, it was received only after lengthy diplomatic negotiations, which resulted in an agreement, which safeguarded to some extent the Venetian jurisdictionalism and the printing industry. In general, however, Rome pursued the purpose of a general application on the Italian territory with determination and considerable diplomatic effort, by mobilizing their official representatives to the individual courts. The operation succeeded particularly well in Central and Northern Italy, where a certain rigor led to prompt destructions of books; conversely a lack of diligence found in the Viceroyalty of Naples and even in some areas of the Papal States determined limited results.

The Clementine *Index Librorum Prohibitorum*, while presented almost as a supplement to that of 1564, returned to the severity and the spirit of 1559, to which he added an appendix containing the prohibition of the complete work of 682 authors, 185 identified works and 276 anonymous. Some of these were banned provisionally, pending expurgation, which in some cases replaced the absolute ban expressed in the previous *Index Librorum Prohibitorum*. Works published after 1564 were included, and to the ten rules of the Tridentine Council some guidelines were added for the prohibition,

correction, and printing of books. These, gathered in an *Instructio*, articulated, reiterated, or made clearer earlier ones and, except for some amendments, would guide the Catholic censorship for subsequent *Indices Librorum Prohibitorum*. Elements of generosity, especially regarding the indications for expurgation, were balanced by a series of rather harsh requirements, in particular that which required that booksellers swore allegiance to the *Index Librorum Prohibitorum* before the bishop or the inquisitor, and promised not to accept suspect heretics in the art. Thus booksellers and printers, having to take an oath to an authority that was not secular, became de facto papal subjects. In addition, the *Instruction* contained a strict clarification of previous prohibitions, including those toward the astrological literature, the *Talmud* and Hebrew texts in general, as well as the vernacular Bible. Immediately after the promulgation, however, nuncios were granted a certain flexibility in the prohibition of the vernacular Bible, especially in those areas – such as Bohemia, Poland, Dalmatia, and so on – in which Catholics were living in close contact with Protestants.

With the *Index Librorum Prohibitorum* of 1596, the peak of the Roman attempt to discipline the faithful's consciousness through the prohibition of the book was reached, marking a turning point with respect to the editorial production. The orientations of the Catholic censors were now defined, and the problem moved to their practical application. First, the question was territorial: in Spain, the catalogues that followed that of 1559 and of Quiroga (1583–1584) had swung between moderation and rigor - if, for example, the 1667 *Index Librorum Prohibitorum* showed some caution, allowing a wide use of textual expurgation, in 1707 the previous rigidity returned, tripling the number of forbidden authors and works. Similarly in Portugal lists (1561, 1564, 1581, 1597) tended to be more restrictive than the Roman, but they were still determined independently from Rome, compiled by the local Inquisition until 1624, the year of the last edition. The margins of independence in other Catholic countries, primarily France, were such as to make room for neither the acceptance nor the

application of Roman *Indices Librorum Prohibitorum*. Moreover, the Catholic Church itself was aware of the problem since, in the 1596 *Index Librorum Prohibitorum*, it ordered bishops and universities outside Italy to draw up and enact autonomously catalogues, which should still be sent to Rome. Italy in sum represented the last bastion.

Nevertheless, the Congregation of the Index, the Holy Office, and the Master of the Sacred Palace all continued to issue decrees containing new prohibitions, in addition to those in the catalogue. These decrees were collected into smaller *Indices Librorum Prohibitorum*, almost supplements to that of Clement VIII. Only in 1664, with Alexander VII, by order of the Congregation a new official *Index Librorum Prohibitorum* was produced, which differed from all the previous in its form and abandoned the division into classes on the Tridentine model, in favor of a simple and agile alphabetical order that contemplated all prohibitions from 1596 to 1664. A second Alexandrian *Index Librorum Prohibitorum* was published the following year, in 1665, introduced by the papal brief *Speculatores*, which reiterated the Tridentine rules that governed censorship. The awareness that the catalogues were to be elastic tools no longer exhaustive was also determined by the increase in the generic classes of prohibition under the headline *libri omnes et quicunque libelli*. If the Clementine *Index Librorum Prohibitorum* had just entered their works of magic and astrology, the seventeenth-century ones added the writings that could have to do with mystical tendencies (Jansenism, Molinism, and quietism), or which concerned hot scientific matter such as heliocentrism, or simply dealt with political and religious disputes: undefined areas, on which the inquisitor could apply his ability to judge the specific case. In this way, especially since the second half of the seventeenth century, the *Index Librorum Prohibitorum* would evolve more and more into an instrument whose use had to be adjusted at the discretion of the individual inquisitors, particularly since the growing number of condemnations made them more and more cumbersome.

Benedict XIV's catalogue of 1758 marked a dramatic change: the titles were sorted alphabetically as it had now become usual, but with a reference to each prohibiting decree; many inaccuracies stratified over the years were corrected, which made it the most accurate and philologically correct tool before the twentieth-century catalogues; many interdictions were reviewed, while others, related to titles no longer in circulation, were abolished. Classes of generically prohibited books were grouped at the beginning, in four paragraphs, and included works of controversy on issues such as the Immaculate Conception, the theory of grace, or the Chinese rites. Reading the Bible in the vernacular was again permitted. Although this did mark a turnaround in the attitude of the Church, the context had changed: the prohibitions continued to exist, but in practice they were much less feared than in the two previous centuries.

By now, however, the weight of ecclesiastical prohibitions was in decline, whereas the times and spaces in which it was possible to evade bans were in the rise. The last edition of the *Index Librorum Prohibitorum* was published in 1948, and on 14 June 1966, the *Index Librorum Prohibitorum* itself was abolished. In the spirit of the Second Vatican Council, even the Holy Office had been dismantled and replaced by the Congregation for the Doctrine of the Faith. The *Index Librorum Prohibitorum* loses its ecclesiastical law value while remaining morally binding for the faithful and Catholic publishers, on whose maturity the Church decided to rely.

Individual, Renaissance Concept of

Douglas Biow

Department of French and Italian, The University of Texas at Austin, Austin, TX, USA

Abstract

Although the individual as a concept had significant purchase on the cultural imagination long before the early modern period and was certainly a key concept in Christian thought in the west, it became a matter of keen and ongoing social, cultural, and artistic concern in Renaissance Italy in a manner that would

have a profound, and in some instances innovative, impact on the rest of Europe.

Heritage and Rupture with Tradition

In his landmark *The Civilization of the Renaissance in Italy*, Jacob Burckhardt famously articulated a notion that would prove to be enduring but controversial. In roughly the late thirteenth and early fourteenth century, the top half of the Italic peninsula – an engine of dynamic economic growth, technological invention, humanistic learning, and artistic, political, and diplomatic innovation – witnessed, according to Burckhardt, the birth of the distinctly “modern” individual. This autonomous, rational, calculating, self-serving, and often innovative entity was “born,” in Burckhardt’s conception of things, from the corporate, communal, and, as he poetically imagined it, dark, veiled, slumbering period of the Middle Ages. Moreover, this modern individual was conceived – like Burckhardt’s notion of the “state” – as a “work of art.” Collectively these new, intrepid individuals, whom Burckhardt characteristically identified as men, were the great heroes of the Renaissance in Italy and the driving, powerful agents of historical change. Paradigmatic was the illegitimate son of a Florentine patrician family: the mid-fifteenth century humanist, sometime architect, and theorist of the visual arts Leon Battista Alberti. Indeed, the very fact that Alberti was illegitimate was of no small importance: the rise of the individual for Burckhardt had much to do with an energetic, primarily masculine need to acquire and demonstrate legitimacy in the vibrant urban societies ruled largely by wealthy merchant patricians and autocratic despots in their aggressively expanding republics and principalities.

Intellectual historians have suggested that Burckhardt’s not entirely positive conception of the wealthy, civic-minded burgher of his own native nineteenth-century Switzerland underpins and largely colors his understanding of the birth and rise of the modern individual in Renaissance Italy. More to the point, historians in general have debunked a variety of Burckhardt’s powerful assertions, particularly in the last few decades. Social historians dedicated to studying large-

Portions of this entry were taken from Douglas Biow, *On the Importance of Being an Individual: Men, Their Professions, and Their Beards*. Philadelphia: University of Pennsylvania Press.

scale demographic and family patterns, interactions, and movements have repeatedly shown, for instance, that Renaissance Italy was hardly composed of free, unfettered, atomized individuals separating themselves off from extended households, close-knit neighborhoods, parishes, guilds, and the like. On the contrary, Renaissance Italy was as corporate in its social structure as was medieval Italy – perhaps in some respects even more so. And cultural, literary, art, and political historians have repeatedly reminded us that the concept of the individual preceded the Italian Renaissance. Its “invention” or “discovery” was hardly just a Renaissance achievement: indeed, it has been argued that it found its fiercest early advocate, philosophically speaking, in Paul and its most powerful early expression in Christian, as opposed to secular, thought – in everything from Paul’s seminal letters to medieval saints’ lives. For that matter, the so-called New-Historicists – a variety of literary-trained, theory-driven, Anglo-American scholars whose concept of self-fashioning has been as influential as it has been misunderstood – have consistently argued that Renaissance men and women had absolutely no conception of the individual to begin with. As evidence that there was indeed no such thing as the individual in the period, some scholars call attention to the fact that there existed no specific word for the modern notion of the individual until roughly the seventeenth century. Before then the word “individual,” in English as in the Romance languages, meant “indivisible” and thus denoted not a person’s autonomy and separation from a community, a sodality, a larger corporate structure but, instead, a deep, long-lasting, and necessary connection to it.

True, the term and concept of “individualism” (as opposed to “individual”) would have been absolutely foreign to anyone in the Renaissance, much less in the classical period or Middle Ages. No one would have conceived of the individual as having certain inalienable rights – rights, that is to say, that a person cannot possibly relinquish even if he or she wishes to do so, such as life, liberty, and the pursuit of happiness. And no one would have conceived of the individual as the basic, underlying unit of economic, social, and political

organization. The Renaissance world was arranged and governed vertically, with one social order and gender ruling hierarchically over another (lords over peasants, men over women), and people took their identity in large measure from corporate privileges and structures. The state was hardly in a position to guarantee equality to all under the law. And even if the state could do so through some set of juridical mechanisms and procedures, the very notion that individuals were equal within the overall social order, albeit ontologically endowed by their divine creator as spiritual equals in the grand, Christian cosmic scheme of things, would have been completely alien to both the elite and nonelite alike in both practical and philosophical terms. Men and women in the Italian Renaissance followed codes of conduct governed by accepted rank, place, and status. Their social world was not our world, their notion of the individual not our notion. Individualism and all the rights, obligations, and privileges associated with that concept today – especially as they relate to the slow, grinding emancipation of various peoples in western thought and practice over time – derive from the very end of the early modern period: namely, the European Enlightenment. Just as alien to the Renaissance mindset would have most certainly been the modern notions of liberal individualism (sometimes called *laissez-faire* individualism) as they have been explored in political, social, and economic theory in the social sciences.

Innovative and Original Aspects

At the same time, even if there existed no single word in the Renaissance that could be used to identify individuals as people seeking to separate themselves off from the various communities in which they were deeply embedded, that in itself does not mean the concept of the individual as a person who stood out from others, viewed in both favorable and unfavorable terms, did not in fact exist. Language, after all, should by no means be construed as deterministic: a “signified” can certainly exist in the cultural imaginary without a designated “signifier” as a placeholder there to

articulate it. And, to be sure, time and again a variety of (above all) men belonging to, or seeking to belong to, the cultural elite in Renaissance Italy used the visual and verbal means at their disposal to give expression to notions of themselves as compelling, singular individuals within the communities to which they were bound and that furnished them with identities. Perhaps most significantly they did so by asserting their own remarkable inimitability within the context of their professional lives. Issues of this sort were explored in edifying treatises authored by practitioners of various arts in the Italian Renaissance, including treatises dedicated to describing and defining the professions of the secretary, ambassador, courtier, physician, surgeon, soldier, painter, sculptor, metallurgist, goldsmith, steward, cook, and architect. And in many respects, those treatises composed by practitioners can and should be conceived not just as writings that served to define and give shape to a professional group identity but also as writings that served to give voice to individuals constructing ego documents in a period that witnessed throughout Europe the rise of artisanal autobiographies.

On the one hand, for instance, there was a profound, widespread, and persistent conviction in the Italian Renaissance, which only intensified in the sixteenth century, that one could uncover universal rules – the “deep structures” – that underlie the arts as forms of specialized knowledge, or, to use a key term of ancient Greek thought, a *techne*. Those rules could be taught, learned, and mastered, often through the very process of imitation itself. Practitioners were thus collectively defined by and through those rules, “fashioned” by them, as they exercised a profession grounded in an art, a *techne*. In this respect, these sometimes more descriptive than prescriptive treatises about various aspects of professional expertise were establishing a group identity defined by an exemplary practice grounded in rational, determinate, rule-bound, communicable, and reliable knowledge. On the other hand, a number of the practitioners who turned to authorship were keenly aware that some people will be good at acquiring an art and some people will not,

so that no matter how hard or diligently they work at it, an innate magical something, the mysterious raw talent of “*ingenium*,” was ultimately required to allow those people to make that mysterious leap from being dutiful learners to becoming remarkable practitioners of a profession. Moreover, one finds expressed every now and then in these discourses a desire on the part of the writer-practitioners to have someone stand out from that group of professionals and be viewed as a wondrously unique, inimitable individual. Try as one might (and indeed one is often invited or seduced by such author practitioners into trying to do so with all one’s might), one simply cannot do what the brilliant individual practitioner author can do, or what someone else of spectacular talent identified in the discourse about the art can individually do, or, for that matter, what even a very small elite circle of individual experts can masterfully do.

Now, practitioners writing about the nature of professional expertise and professional life were certainly not the only ones to explore in innovative ways the dynamic connections that linked the community and the individual dialectically in Renaissance Italy. Visual artists in general and painters in particular often enough gave expression to the importance of the individual in the context of broader communal concerns, particularly when it came to capturing the cultural elite in the new, popular art form of portraiture. To be sure, portraits of the period concretely rooted men and women in broader communal contexts. Time and again they represented them as they were inextricably bound to and constrained within a highly stratified social order: by virtue of the very clothes they wore, the fashions they followed, the postures they adopted, the objects they tellingly surrounded themselves with, and the calculated spaces in which they were ensconced, all of which defined their place, purpose, and position in both local and broader cultures. But the attention to credible, accurate likeness in the period also mattered to those being captured in portraits. The men and women being represented, both realistically and idealistically, clearly wanted themselves to be viewed just so, with a gaze or smile or gesture that would

register visually the nature of who they were not just as members of all-encompassing and overlapping communities – such as households, guilds, confraternities, or political and religious orders – but also as individuals, with their own distinctive features and their own singular “motions of the mind,” to use Leonardo da Vinci’s phrase.

Impact and Legacy

Burckhardt was thus both right and wrong. He was wrong to imagine that the individual suddenly emerged out of the slumbering darkness of the Middle Ages as a sort of bright, shining light leading the way forward in an onward and uplifting manner from the Italian Renaissance to the modern era – or at least to the bourgeois individual of Burckhardt’s nineteenth-century Europe. The concept of the individual clearly existed both before and after the Italian Renaissance, although it remains a matter of ongoing scholarly debate how the evolution of the concept of the individual actually unfolded over time in the west, from ancient Greece to, say, modern America, with its still deep and sometimes crass investment in the mythology of rugged individualism, as well as how it unfolded from being a key feature of Christian dogma in the religious writings of Paul, for instance, to becoming, conversely, a key feature of modern secular thought and western liberalism. But Burckhardt correctly intuited that something new was afoot in the Italian Renaissance with regard to the changing importance attributed to the value of the individual in the community. And he was certainly correct to recognize that the story of the individual is an important feature of the larger narrative that forms the complex cultural and intellectual history of how various notions of selfhood evolved in the west.

Induction, Philosophical Conceptions of

John P. McCaskey

Columbia University, New York, NY, USA

Abstract

How induction was understood took a substantial turn during the Renaissance. At the beginning, induction was understood as it had been

throughout the medieval period, as a kind of propositional inference that is stronger the more it approximates deduction. During the Renaissance, an older understanding, one prevalent in antiquity, was rediscovered and adopted. By this understanding, induction identifies defining characteristics using a process of comparing and contrasting.

Important participants in the change were Jean Buridan, humanists such as Lorenzo Valla and Rudolph Agricola, Paduan Aristotelians such as Agostino Nifo, Jacopo Zabarella, and members of the medical faculty, writers on philosophy of mind such as the Englishman John Case, writers of reasoning handbooks, and Francis Bacon.

Synonyms

epagōgē; *inductio*

Heritage and Rupture with the Tradition

An understanding of the earlier history of induction is essential to understanding induction in the Renaissance, for the story of induction in the Renaissance is the story of a slow rediscovery of an earlier – and to us unfamiliar – conception.

Aristotle said that what induction is, is obvious (*Topics*, 157a8). It is a proceeding from particulars to a universal (*Topics*, 105a13–4). But there is an ambiguity here. Does Aristotle mean particular and universal statements? Or does he mean particular things (or kinds of things) and universal concepts? Nowadays we presume the first, but Socrates, who Aristotle says introduced induction (*epagōgē*), thought the second. In Plato's *Ion* (540b–d), Socrates considered the helmsman, doctor, cowherd, wool-maker, and military general, and concluded that the master of any craft is one who knows its subject best. This was some sort of induction but not an inference from a complete or even incomplete enumeration. This was a compare-and-contrast process of determining what it means to say someone is a master. Once the process is completed, there is no worry

that the next master will not know the craft well, for we have discovered that this is part of what it means to be a master. If a man does not know his material well, he is not a master. The universal claim is true by definition. But the definition is not arbitrary or stipulative. It is the conclusion of an inductive inquiry. (It is what Immanuel Kant said cannot exist, an analytic *a posteriori*.) When Aristotle said Socrates gets credit for inductive reasoning and universal definitions, Aristotle was listing not two unrelated discoveries but two perspectives on one cognitive operation. Aristotle's own methods for identifying formal cause, as in Book V of the *Topics*, are methods of Socratic induction. If Aristotle's *Prior Analytics* is about deduction, his *Posterior Analytics* is about induction, and induction of the Socratic sort. Cicero's view on induction, too, was Socratic. It was Cicero who coined the Latin term *in-ductio*, on the model of the Greek *epa-gōgē*. He would have a large influence on induction in the Renaissance. Others in the ancient world agreed with Aristotle and Cicero. Indeed, the Socratic understanding of what induction is was conventional all through Greek, Hellenistic, and early Roman antiquity.

This understanding got switched around by the Neoplatonists of late antiquity. They read Aristotle's particulars and universals as about particular and universal statements, not particular things and universal concepts. The change started with Clement of Alexandria in the second century. He said that a definition is a summation and therefore that induction obtains force not by comparing and contrasting but by completely enumerating components. In Alexandria, around 500 AD, Ammonius Hermiae and his students Simplicius and John Philoponus incorporated Clement's view into their comprehensive reworking of Aristotle. In their Neoplatonic synthesis, induction can be reduced to a kind of deduction. The deduction has the form of a syllogism with a minor premise suppressed. The minor premise is the presumption that all particulars have been enumerated. The proposal found support in Aristotle's *Prior Analytics* B 23, but only because the Alexandrians read that difficult chapter in a new way. All other mentions in Aristotle's corpus indicate Aristotle had a Socratic conception.

The Alexandrian, Neoplatonic, non-Socratic understanding of induction was transmitted through the medieval period in both Latin and Arabic. In this conception, induction is a kind of propositional inference. That is, the particulars are not particular concepts or things but particular statements (e.g., this magnet attracts iron; that magnet attracts iron; the other magnet attracts iron) and the universals are universal statements (e.g., all magnets attract iron). And unless the enumeration is complete, the conclusion cannot be certain. While nowadays we use white swans and an Australian black swan to demonstrate the fragility of such induction, Scholastics used the jaws of animals: This animal chews by moving the lower jaw; that animal does; the other animal does. If we conclude that all animals chew by moving the lower jaw, the conclusion will be overturned when we discover the Nile crocodile, for it moves the upper jaw.

For an example of a reliable induction, Ockham (c. 1287–1347) used the Holy Trinity: What is true of Father, Son, and Holy Ghost is true of God. The enumeration is complete. Scholastics recognized that an incomplete enumeration could be made complete by adding *et cetera* to the list of particulars. Formally, this allowed the induction to be rendered as a deduction, but in practice of course it does not do much. Whether that *et cetera* is exhaustive is the very question at hand. (Ockham, *Summa logicae*, III.3.31–7)

In the Renaissance, the established, Alexandrian, Scholastic conception of induction was increasingly questioned.

Ockham's younger contemporary Jean Buridan (before 1300–c. 1360) claimed that with or without the *et cetera*, an induction by enumeration of particular statements is not really an induction at all, or at most it is just a special case. He espied in Aristotle's *Posterior Analytics* B 19 a completely different conception of induction. Here induction seems to be the process of coming to know universals in a hierarchical process of combining sensations to form memories, memories to form experiences, and experiences to form universals. By this we come to know that every fire is hot, that every magnet attracts iron, that all rhubarb purges bile, that everything that

comes to be in nature comes to be from some preexisting subject, and so on for many other indemonstrable principles. These are known true not by extending a sufficiently long list of observation statements, but by discovering the very nature of fire, magnets, rhubarb, natural subjects, and so on. To make his point, Buridan used Socrates' example of the master in a discipline. (Buridan, *Summulae*, 6.1.4, 6.1.5, and 8.5.4)

Buridan had discovered the alternate conception of induction in Aristotle's *Posterior Analytics* but the conception is even plainer and more pervasive in Aristotle's *Topics*, the foundational text for a Renaissance approach to reasoning that scholars now call topics-logic. The humanists Lorenzo Valla (c. 1406–1457) and Rudolph Agricola (1443/4–1485) were influential advocates of this approach.

In induction, Valla mocked any attempt to get around a limited enumeration by adding *et cetera* or the like; indeed he mocked any attempt to treat induction as a defective sort of deduction. He insisted on returning to the views of induction advocated by Cicero and Socrates. Valla said Boethius (d. c. 526 AD), who had advocated the Neoplatonic Alexandrian conception, was like someone who has stolen a horse and tries to hide the theft by cutting and dyeing the horse's hair. What Boethius was peddling, Valla said, was simply not true induction. (Valla, *Repastinatio*, 3.16)

While Valla was dismissive, Agricola was accommodating. He sought a taxonomy that offered a place to both the Scholastic convention and the rediscovered ancient. He proposed to call the conventional inference *enumeratio* and to use *inductio* for the ancient, open-ended procedure. For the second, he treated Socrates, Cicero, and Aristotle's *Topics* as the authorities. (Agricola, *De Inventione Dialectica*, 2.18)

Innovative and Original Aspects

Buridan, Valla, Agricola, and other challengers did not immediately unseat the conventional understanding of induction. Buridan's writings on the subject barely circulated and were never printed. Although Valla criticized the

conventional view of induction, he did not have much to say on the alternative. He died in 1457. Agricola died in 1485, his *De Inventione Dialectica* not yet printed. Into the 1480s, 30 years after the invention of printing, almost everything one would read on induction still presented the conventional Scholastic account whereby induction is a defective kind of syllogism made good by complete enumeration, actual or presumed.

But during the 1480s newly published texts began to undermine that account. In 1484, all of the Socratic dialogues became available in Marsilio Ficino's new Latin translation. It thus became easier to see what Aristotle meant when he said Socrates introduced induction. In the 1490s, commentaries on Aristotle became more comprehensive. New attention to the *Posterior Analytics* and the *Topics* disrupted long-held views of what Aristotle had thought about induction. Editions of Cicero's *Topics*, with its plainly Socratic view of induction, were frequently printed. Valla's *Repastinatio Dialectice et Philosophie* came into print. Agricola's *De Inventione* was published in 1515. By the 1540s, students of induction were faced with multiple traditions and inconsistent interpretations. While Aristotle had said that what induction is, is obvious, the Renaissance Paduan Agostino Nifo, in a commentary on the *Topics* published in 1535 and several times thereafter, disagreed. He noted that the very nature of induction was now in dispute (Nifo, 1.68).

The tension is evident in logic textbooks in England. Since Peter of Spain's *Tractatus* of the mid-thirteenth century, induction had a conventional place in logic textbooks. It was treated briefly, as a derivative of deduction, along with enthymeme and example. After extended treatment of the syllogism, induction would get a few short paragraphs, maybe one page. John Seton's *Dialectica*, first published in London in 1545 was different. The treatment of induction was three pages long, wide-ranging, and eclectic. Seton began conventionally enough but then introduced newer examples, one that the Protestant Philipp Melancthon (1497–1560) had recently used. Seton added the requirement that in a valid

induction, no counter examples be observed. He compared induction to deduction in ways Aristotle had. He echoed remarks Agricola had made and reported on Agricola's proposal to use the word *enumeratio*. He brought in the new topics-logic and cited Cicero and Plato. Nearly all the traditions and subtraditions on induction made an appearance in this one place, but Seton made no attempt to integrate them. (Seton, "De Inductione," *Dialectica*)

Thomas Wilson tried. His *Rule of Reason* was the first logic textbook in English. The first edition was published in London in 1551 and except for characteristically Protestant examples and use of some of Agricola's language, what Wilson said about induction in that edition was not particularly unusual. This changed, however, with the second edition, "newly corrected," printed only 1 year later, in 1552. In its treatment of induction, Wilson added a second section, larger than all of his original treatment, on what he said is another kind of induction, one that the learned call Socrates' induction. The presentation, while not particularly insightful, echoes Agricola and tries to incorporate the developing enthusiasm for the new alternative to Scholastic induction. (Wilson *Rule of Reason*, 1551, "Inductio"; in the edition of 1552, "Inductio" fol. 66.)

Such enthusiasm was growing in Padua among the medical faculty. William Harvey, a student at Padua in 1600, called the medical faculty's new method *regula Socratis*, the rule of Socrates. His teachers understood it as a revival of ideas Aristotle had developed in his biological works and in the *Posterior Analytics*. Using this method, one formed universal statements by identifying the essence of something, and in the case of anatomical organs, this essence was the organ's function. Such essence was discovered by careful dissection and experimentation and a thoroughly Socratic process of comparing and contrasting. (Cunningham 1985)

An opponent of this new inductive science was Jacopo Zabarella, professor of natural philosophy and Padua's most distinguished logician. In the early twentieth century, Ernst Cassirer and then John Herman Randall proposed that Zabarella's so-called regressus theory included an influential

new theory of induction. A recently published modern edition and English translation of Zabarella's relevant works shows that induction played no significant role in regressus theory and what Zabarella had to say about induction was in fact designed to thwart advance of the new conception. (Zabarella 2014)

In England, the new thinking on induction was bolstered by John Case in his logic textbook *Summa veterum interpretum* of 1584 and in his treatise *Lapis Philosophicus* of 1599. In the first, he brings Aristotle's four causes, including the formal cause (central to Socratic induction), into the discussion of induction, even if only perfunctorily. In the second, he explores the Aristotelian idea that abstract ideas are known at first only confusedly (*confuse*) and then, after sufficient cogitation, come to be known distinctly (*distincte*). What is important about Case's presentation is not the content, but the terminology. *Notio* (and its cognate *notitia*) are used more frequently than in the past. The term will be central for Bacon. Furthermore, Case calls the ill-formed abstractions known only confusedly "abstract phantasms" or "idols," another concept central for Bacon. (Case, 1584, 1.19; 1599, 1.1, 2.1.3)

Francis Bacon (1561–1626), one of the most influential writers on induction and scientific method in Western philosophy, entered a conversation that was already underway. His *Novum Organum* (1620) was cast in the language of that conversation. His contribution was to systematize and fully revive Socratic induction. In doing so, he brought to maturity the Renaissance reconceptualization of induction.

Bacon came to induction late and indirectly, for his initial interest was not primarily epistemological but practical. He sought some method by which someone could confidently make things that had never been made before. The method would need to ensure two things, what he called certainty and liberty. The first, Bacon thought, was easy, if one ignores the second. It takes no great genius or much method, for example, to know that heat melts butter (not Bacon's example; his involved making something white). The next dollop thrown on the skillet will melt. We can continue doing what we have always done, and we know what will happen. But what of cheese?

What about wax? Clay? Will they behave the same? What about a new artificial material, envisioned but not yet produced? As we exercise our liberty, as we try things increasingly dissimilar, we lose our certainty – at least without a proper method. Bacon wanted a method that would allow liberty without sacrificing certainty.

To solve his problem Bacon turned to Aristotle's concepts of *kata pantos* and *katholou proton*. A property that is true *kata pantos* is true for all members of a class. But a property that is true *katholou proton* is true of all and only all members of a class. Thus a proposition predicating a *katholou proton* property is convertible; that is, subject and predicate can be swapped. All triangles have angles that sum to 180° , and any polygon whose angles sum to 180° is a triangle. This suggests a rule: If you want a polygon whose angles sum to 180° , make a triangle. But even if the properties are *katholou proton*, the rule may not be useful. Having a flat surface, feeling smooth, appearing bright, and being able to see your face in it may all be *katholou proton* properties of a metal, but to make a metal all of these, you need to know which causes the others, or, to use Bacon's term, which is more "original." It is not enough to know that properties "cluster and concur"; it is important to identify which is the cause. But which cause? Bacon considers Aristotle's four. He dismisses the final cause as inapplicable in cases outside of human actions. And he thinks knowing just the material and efficient causes can provide certainty but not liberty. That knowledge helps only to "achieve new discoveries in material which is fairly similar." What is needed, Bacon says, is to identify the "form or formal cause." The formal cause is what makes something the kind of thing it is; it identifies the Socratic essence. Bacon says that "Aristotle's school" – by which he meant Scholastic advocates of the Neoplatonic Alexandrian Aristotelianism – was right "that there is no true knowledge but by causes, no true cause but the form, no true form known except one." But Aristotle's school misunderstood the form and consequently – and wrongly – regarded its discovery as hopeless. (Bacon 1857, 325)

A form, Bacon says, is merely a particular arrangement and motion of (frequently

imperceptible) physical components. In Book 2 of the *Novum Organum*, Bacon presents a method for identifying that arrangement and motion. He says the search should begin with a comprehensive inventory of observed instances, related absences, and related variations. He offers 27 kinds of observations (“prerogatives”) that are particularly valuable for discovering the essence or formal cause of something. When he uses his method to discover the formal cause of heat, he concludes that heat is a particular kind of motion of imperceptible particles. He then makes the remarkable claim:

If in any body you can arouse a motion . . . [of this certain kind], you will certainly generate heat. It is irrelevant whether the body is elementary (so-called) or imbued with heavenly substances; whether luminous or opaque; whether rare or dense; whether spatially expanded or contained within the bounds of its first size; whether tending toward dissolution or in a steady state; whether animal, vegetable or mineral, or water, oil or air, or any other substance whatsoever. (Bacon 2000, book 2, aphorism 20, following Bacon’s highlighting.)

From an analysis of particulars, Bacon came to a tremendously universal conclusion, one of both certainty and liberty. He came to call his method a kind of induction.

Bacon stresses that this particular kind of motion is not the efficient cause of heat, that is, it is not the case that there is one thing, the motion, that produces another thing, the heat. Rather the particular kind of motion is what heat is. If you can produce this kind of motion, you produce heat, because the motion and the heat are the same thing. Motion (the genus) and the particular kind of it (the species) define heat, but the definition is discovered not stipulated. Inductive science becomes the search for universal statements warranted by concepts properly defined by essential characteristics. Baconian “idols” are ill formed and poorly defined abstractions. Induction (of the Socratic type) provides the needed remedy.

For Bacon an induction is warranted not by positive instances that confirm, but by comparisons that contribute to the definition of the predicate. Finding that definition by this process of compare-and-contrast is the essence of Socratic induction. It was this to which Bacon referred

when he said, “[The correct procedure] has not yet been done, nor even certainly tried except only by Plato, who certainly makes use of this form of induction to some extent in settling on definitions and ideas” (Bacon 2000, book 1, aphorism 105).

Impact and Legacy

Baconian induction became canonical in natural philosophy. An important early practitioner was Robert Boyle (1627–91), a candidate for the title of first modern chemist. He said the use of experimental induction to find the formal cause of chemical properties was the “noblest” and “most important” part of natural philosophy. In 1837, William Whewell looked back on 200 years of scientific progress and gave Baconian induction the credit. Even David Hume accepted the Baconian conception. He never used “induction” to name the object of his epistemological doubts. That is a recent attribution. It was only after John Stuart Mill’s *System of Logic* (1843) that the Scholastic conception returned and again became standard. (Ducheyne and McCaskey 2014)

Writers on induction in the Renaissance were not trying to solve the “problem of induction” that we talk about. If anything went by that name in Renaissance philosophy, it was merely the problem of how to form good abstractions and to define by essentials. The Renaissance project finished with Bacon’s proposal on how to do so.

Infinite, Renaissance Idea of

Valentina Zaffino

Faculty of Philosophy, Pontifical Lateran University, Rome, Vatican City State

Abstract

Reflection upon the infinite (*apeiron* in Greek, *infinitum* in Latin) crosses the whole history of thought and involves several fields of

knowledge: philosophy itself, theology, cosmology, and logic-mathematics. The Greek term *apeiron* stands for something that possesses neither physical limitations nor determined qualities, an entity lacking a conceptual determination defining it (see Anaximander). During Antiquity, only few philosophers allowed for the existence of actual infinite reality; rather, Aristotle's view of a merely potential existence of the infinite was what prevailed. From the sixteenth century onwards, astronomical discoveries challenged the Aristotelian-Ptolemaic cosmological system: the estimated distance between the center of the Earth and the last sphere grew progressively larger. This scientific advancement was joined in theology-philosophy by the thought that God, who is infinite in act, infinitely good, and the origin of the created universe, does not create finite reality. Rather, He manifests his infinite power by creating an infinite cosmos (this assumption is shared by Nicholas of Cusa and Giordano Bruno).

Synonyms

Unlimited

Heritage and Rupture with the Tradition

The Greek concept of the infinite deeply influenced Medieval and Renaissance thought and cosmology in particular, it being founded upon the Aristotelian-Ptolemaic system. Except for a few instances, Antiquity displayed a profound *horror infiniti*: as a matter of fact, any lack of boundaries caused bewilderment among the Greeks. Ontological perfection was thus believed to be only found in the finite: through its inherent boundaries, it was deemed to encompass the wholeness of being and exhaust any likelihood of becoming.

However, reflections upon the infinite can indeed be found in some ancient naturalist philosophers, namely, Anaximander, the Eleatics, and the Pythagoreans. In a strictly astronomical sense, many narratives depict a man standing at the

extreme boundaries of the universe: with a hand or arrow, he crosses the limit of the last sphere – that of fixed stars – thereby opening a gap within the infinity of the cosmos. This image is found in Archytas (see fr. 47 A 24 DK), Lucretius (*De rerum natura*, I, 968 ss.), and Cicero (*De natura deorum*, I, 20–54). It then reaches the Renaissance cosmological debate with Giordano Bruno (*De l'infinito, universo e mondi*, “Proemiale epistola”) and John Locke (*An Essay on Human Understanding*, II, 17).

However, the Renaissance will mostly be concerned with Aristotelian and Thomistic views. In *Physics*, III, Aristotle wonders about the very essence of the infinite, claiming that an infinitely large body cannot exist in actuality, since infinity is only allowed in potentiality, that is, in a processual sense. The concept of the infinite is indeed linked to that of continuity; thus the *apeiron* is not something that is indefinitely spread, rather an entity that is infinitely divisible. The act is thus reiterated without limits, but the object to which the division process is applied is not indefinite. Aristotle allows for a potential infinity, mainly by articulating it in infinite division and indefinite subtraction; thus, the infinite tends to smallness, but it does not reach a minimum limit. Rather, it continues the logical reduction process of a given magnitude. The philosopher also denies increase, thus rejecting the possibility whereby an object can increase its size endlessly; on the other hand, he deems the cosmos's limits as the maximum possible magnitude a body can increase toward. Surpassing the universe's magnitude is therefore physically impossible for both an actual entity and a potential one, since its dimension is the measure of the whole (*Physics*, IV). Therefore, unlike ancient philosophers, who asserted the cosmos was infinite, Aristotle sees the *apeiron* in a negative manner. Outside it there is no void; rather, something always exists beyond it. Therefore, it can be likened to indefiniteness.

During the Middle Ages, Thomas Aquinas reworded the alternative between actuality and potentiality and their application to the limitless. The theologian reconsidered the potential infinite as syncategorematic, by giving way to the unlimited process of logical-mathematical repetitions of

the finite. On the other hand, categorematic infinity is always the relative property of something which surpasses any actual finite measure. Since Medieval interpretation of the potential infinite requires a shift toward actual infinity, this somehow resolves the opposition between potency and act, thus contemplating the idea of the unlimited. Thomas can be likened to Aristotle in the latter's denial of actual infinity and the idea according to which only finite things are perfect. However, Aquinas narrows these arguments to the field of created reality, the reflection of God, which is perfect overall because it is finite. In God, rather, infinity and perfection coincide: the former also includes the property of perfection, since form finds perfection in its infiniteness while matter within its limits. Therefore, it is only in the Subsistent Being, the pure act, that infinity becomes actual while still being impossible in created reality (*Summa theologiae*, I, q. 7).

Innovative and Original Aspects

The Renaissance saw an evolution in the concept of infinity which not only prevailed in metaphysics and theology but also in physics and cosmology, to the detriment of the Aristotelian-Ptolemaic system. Thus, the scientific revolution tackled the infinite in both a strictly philosophical manner (namely, by the likes of Nicholas of Cusa and Giordano Bruno) but also from an astronomical point of view. This resulted in the failing of Medieval cosmology: heliocentrism replaced the geocentric system and its celestial spheres (which made up and supported the universe by revolving around the Earth). This new astronomical model did not include the last sphere that of the fixed stars; rather, it was replaced by the idea of an infinite universe and the homogeneity of the matter of which it was made, thus departing from the traditional separation between the lunar and sub-lunar worlds.

The pioneer of Renaissance theories on the infinite was Nicholas of Cusa, as recognized by Bruno, Kepler, and Descartes. In his *De docta ignorantia*, Nicholas states that human knowledge is only conjecture; therefore, the mind cannot fully apprehend God, according to a

gnoseological thesis that always preserved the transcendence of the creating principle. At the same time, the universe too is impossible to grasp, since it is an *explicatio* in space and time of the divine *complicatio*. Though he maintained a clear ontological separation between the One (God) and multiplicity (His sensitive *contractio*), Nicholas found that both are impossible to apprehend and, most importantly, infinite. The divine cause is, in its nature, infinite; therefore, there cannot be but a plurality of worlds. The space around them, it too a reflection of the One-Whole, must necessarily be infinite: an infinite universe populated by infinite worlds. Therefore, the primary infinite cause – the efficient cause – matches the effect's infinity. The various means of divine contraction into the world are the sign of *coincidentia oppositorum*, when the infinite coincides with the finite and the maximum with the minimum. However, there still remained a substantial difference between infinity in the Divine and in creatures, something that profoundly marked Cusa's and Bruno's systems, though the former maintained God's transcendence. For Nicholas of Cusa, God alone is the absence of all limits – thus a *negative* infinite – since He Himself is the fullness of all possibility. In the case of creatures, on the other hand, their infinity is a *privative* one connected to the concept of the indeterminate.

According to Giordano Bruno, too, the need for an infinite universe made up of infinite worlds is justified by a specific theological assumption: the overflowing and limitless power of the first principle generates an equally inexhaustible effect. Since God is the Act, the world – which is His reflection – is the manifestation of all possible forms; hence, matter is made up of a plurality of entities which through vicissitude follow the process of cosmic development. Deeming the infinite as actual is what sets Bruno apart from Aristotelian-Scholastic philosophy. Unlike Cusanus, however, Bruno honors a naturalist view that is strongly immanentist by asserting that divine infinity and material infinity actually coincide: God is thus both *natura naturans* and *natura naturata*. On a cosmological level, Bruno accepts the Copernican heliocentric model

endowing the notion of infinity with both a quantitative and a qualitative value; the Copernican-quantitative dimension of limitless space is joined by the qualitative dimension of reality, which according to hermetic tradition is ruled by a vitalistic principle that eludes geometry and mathematics. On the topic, Bruno's Italian dialogues on cosmology are an excellent read: *La cena de le Ceneri*, *De la causa principio et uno*, and *De l'infinito universo e mondi*.

On the other hand, Renaissance astronomical discoveries gradually made the Ptolemaic system fail, whereas the possibility of an infinite universe was increasingly welcomed. Bruno himself accepted the Copernican heliocentric system and praised the Polish scientist for having stood out in astronomy much more than Ptolemy, Hipparchus, or Eudoxius (see *La cena de le Ceneri*, I). Copernicus also recognized the need to move the universe's last sphere and he maintained that the universe is *immensum* in its indefinite extension. In the same way, even though he did not accept infinite space, astronomer Christoph Scheiner stated that the distance between Earth and the fixed stars is equal to an enormously large figure compared to what the Scholastics had calculated; nor did Nicolaus Mercator (Nikolaus Kauffmann) mention the size of the last sky in his tables of fixed stars longitudes. Therefore, the shift between an enclosed and limited dimension to an "indeterminate" magnitude marked an important milestone in the affirmation of an infinitely large universe.

As for Galileo, one must distinguish an astronomical and a strictly mathematical level in his writings. In the *Dialogo sopra i due massimi sistemi del mondo*, Galileo states that the universe has no center, the fixed stars being other suns or other centers. However, he does not affirm the universe's infinity: in his opinion, this is a metaphysical issue that must not be tackled by astronomers. In mathematics, on the other hand, Galileo stated that a line segment can be divided into an infinite number of parts which are not further divisible; since they are an infinite quantity, they must necessarily lack size, for even a small size would necessarily make up a line segment that includes a finite number of parts.

Therefore, with Galileo, the debate over the existence of actual infinity seemed to reach a crucial point: for the first time and on a metaphysical level at least, cosmological infinity and the possibility of dividing matter into infinite parts with an infinitely small size both became possible (the argument was subsequently reexamined by Newton in an astronomical way).

Impact and Legacy

The Renaissance debate over infinity had a great impact on the seventeenth and eighteenth centuries. According to Descartes, the concept of infinity was functional in proving God's existence and was thus both metaphysically and theologically crucial. Thanks to the *cogito*, mankind acquires clear and evident knowledge of the innate idea of God, mainly by underlining His infinity. In proving God's existence, based on the assumption that the cause of an idea must be at least as real as the idea itself, Descartes claims that the idea of the infinite does belong to humans but is not caused by them alone; mankind is corruptible, therefore finite. Thus, since humans can feel a sense of their own limit and finiteness, there must necessarily exist a primary cause (superior to mankind), which carries the same sense of infinity humans experience with deprivation, whose highest manifestation is methodical doubt. Descartes also believes that the concept of indefinite is reserved for contingency – thus for humans, too – while the concept of the positive infinite is only reserved for God (see *Principia Philosophiae*, I, 27).

Again, in metaphysics, Spinoza built a markedly immanentistic system by strongly drawing on Giordano Bruno's theories. Like Bruno, he believed that the modes of the infinite substance proceed in an infinite way through its infinite attributes: an argument that significantly involved the subject of freedom in divine action.

Leibniz, on the other hand, viewed the world as an organic entity whose substance is made up of infinite monads interacting with each other within the body that contains them (the physical world). Substance is thus guided by its very own finalism, which human knowledge can grasp through

mathematics; through it, one can investigate the mechanism regulating mutual actions and interactions between the parts of corpuscular matter. Therefore, Leibniz accepted the actuality of the infinitely small in a qualitative sense by denying the potential infinite of the geometrical continuum.

Innate Heat

Elisabeth Moreau

Department of History, Faculty of Philosophy and Letters, Fonds de la Recherche Scientifique – FNRS/Université Libre de Bruxelles, Brussels, Belgium

Abstract

Innate heat is a fundamental concept in Galenic medicine, referring to a physiological heat proper to living beings. Originating in the heart, it takes part in the vital and organic functions of the human body. As instrument of the soul, it animates the body in a similar way to a bodily flame. Its nature and role is bound up with the definition of life within a theoretical framework combining natural philosophy and medicine. Consequently, physiological debates on innate heat often converged on cosmological, chymical, and embryological considerations on the origin, composition, and transmission of life.

In Renaissance Galenism, innate heat is traditionally described as a bodily substance of a subtle nature, transported by the spirit, and transmitted at birth through the seed. It is also related to the radical moisture, so that the *calidum innatum* often refers to the vital substance formed by the spirit, the innate heat, and the radical moisture. Within the human body, the innate heat is sourced in the heart and cooled down by the inspiration of air in the lungs during breathing. At the same time, it is spread through the whole body to operate the

vital functions. In particular, it is the instrument of the vegetative soul in order to achieve the physiological operations of generation, growth, and nutrition – mainly digestion and coction. It is also in charge of forming the vital spirit in the left ventricle of the heart.

[Calidum innatum](#); [Calor innatus](#); [Calor Nativus](#); [Calor vitalis](#); [Vital heat](#)

Heritage and Rupture with Tradition

Galen systematized the notion of heat in his medical theory built upon Hippocratic, pre-Socratic, Platonic, Aristotelian, and Stoic philosophies (Solmsen 1957). In this respect, the Galenic physiological system owes a significant debt to Aristotelian biology, which theorized the nutritive functions of the innate heat (Freudenthal 1995). It is also rooted in the Stoic *pneuma* responsible for the sensory and motive functions (Debru 1996).

The Galenic definition of innate heat was transformed by Fernel's physiology, influenced by Ficinian Platonism (Fernel 1567). Fernel developed a medical theory of spirit and innate heat grounded in the Aristotelian definition of vital heat as a substance analogous to the element of the stars and contained in the foamy part of the seed (Aristotle 736b30). While the Galenic interpretation suggested innate heat as an elemental substance, Fernel defined it as non-elemental and akin to solar heat. It is then transported by a celestial resident spirit (*spiritus insitus*), which is distinct from the three Galenic flowing spirits and plays the role of a bond between soul and body. This spirit is composed of ether – the Aristotelian fifth element – whose subtle nature allows it to host the bodily heat and to be the soul's first instrument performing the physiological functions. In addition, it is connected with the total substance of the living body, whose properties are occult and cosmological (Fernel 1548).

Fernel's theory of innate heat sparked long-lasting debates in late Renaissance Galenic medicine (Walker 1958). Moreover, the discussion of

the existence of a cosmic innate heat often slid into the nature and role of the spirit *insitus*, initiating further medical debates on the generation of living beings and the plastic virtue of the seed (Hirai 2011). By contrast, Paracelsian medicine disregarded the concept of innate heat, whose subtle nature and physiological functions were attributed to the animal or vital “balsam” protecting the body from putrefaction (Severinus 1571; Hirai 2005; Bianchi 1982).

In the first half of the seventeenth century, the Renaissance concept of innate heat was challenged as to the chymical and physiological aspects of its vital status and nutritive function. Harvey called into question the physiological triad of the spirit-heat-moisture by disqualifying Fernel’s definition of spirit and by minimizing the role of the heart (Harvey 1628). Only vital heat and radical moisture remained as mere properties of the blood, which in turn took the role of the vital substance inherent to the seed and analogous to the stellar element (Bono 1990). Later on, the concept of innate heat would be reshaped by mechanistic and chymical theories of combustion and fermentation, illustrated by Descartes and van Helmont (Mendelsohn 1964).

Intellect, Renaissance Concept of

Thomas Jeschke

Faculty of Arts and Humanities, Thomas-Institut, University of Cologne, Cologne, Germany

Abstract

Following the medieval tradition, Renaissance philosophy approaches the intellect against the background of a twofold perspective, viz., an

ontological and an epistemological perspective. These very problems, therefore, formulated during the Renaissance are to a great extent “medieval.” The ontological perspective focuses on the intellect’s state of being, e.g., what is the intellect and what is its relation to the human soul? The epistemological perspective concentrates on the intellect’s function or operation, e.g., how does the intellect work in order to render understanding possible? Both of these approaches are inextricably interwoven with one another. The solutions offered to these problems make use of familiar medieval currents, such as Aristotelianism, Averroism, (Neo-)platonism, Thomism, Scotism, etc. – without being, however, exclusively bound to one of them. Renaissance philosophy, moreover, considers all of these currents in order to offer a coherent picture of the intellect. Some of the main problems discussed include, among others, whether the intellect belongs to the individual soul or whether it is supra-individual; whether the soul perishes with the body or is immortal; whether intelligible species are required for understanding. Regardless of the so-called “eclectic” approaches in Renaissance philosophy, the discussions are notably shaped by the Averroist interpretation of Aristotle’s psychology.

Heritage and Rupture with the Tradition

In line with the medieval tradition that preceded it, Renaissance philosophy approaches the theme of the intellect against the background of a twofold perspective, viz., an ontological perspective on the one hand, and, on the other, an epistemological perspective. Thus, the very problems formulated during the Renaissance are to a great extent “medieval.” The ontological perspective focuses on the intellect’s state of being. Some persisting questions include the following: does the intellect belong completely to the individual and thus is mortal? Alternatively, is the intellect – at least to some extent – supra-individual and thus immortal? Is the intellect (or, the rational soul) the unique substantial form of man, or simply one

among others? On the other hand, is the intellect itself a substantial form in the first place? Does the traditional distinction between the agent and possible intellect remain consistent if many substantial forms or souls are granted? Inextricably interwoven with the ontological approach to the intellect is the epistemological perspective, which concentrates on the function of the intellect: how does the intellect operate in order to render understanding possible? Is the distinction between possible and agent intellect necessary? Are universals abstracted by the intellect or does the intellect in some way participate in a supra-individual process of cognition? Although both of these broad perspectives were discussed, Renaissance philosophers generally are more interested in the ontological questions; to put it in another way, they do “theory of knowledge for anthropological or cosmological reasons” (Keßler 1988, 533; for the discussion of intelligible species in Renaissance philosophy, cf. Spruit 1995).

The centers of Renaissance psychology were the Universities of Bologna and Padua. The first generation of scholars there was strongly influenced by the medieval paradigm. For example, Biagio Pelacani da Parma († 1416) first taught at Paris, then in Bologna, Florence, and Padua. He was highly influenced by John Buridan († after 1358). Paul of Venice († 1429) studied in Oxford and was influenced by Oxford logicians and nominalism (Kuksewicz 1995). When it comes to psychology, Jean of Jandun († 1328) was one of the notable “transmitters” of Averroism from Northern Europe to Italy (Hankins 2007; Brenet 2003; Brenet 2008), and another was likely Taddeo da Parma (Vanni Rovighi 1951; Vitali 1981; Michael 1993, p. 68; Kuksewicz 1995, p. 376).

At Bologna and Padua, we find present nearly every position with respect to the intellect. There is the Averroism of the High Middle Ages as well as (late ancient) Alexandrism; we find vigorous defenses of Church doctrine, as well as the Aristotelianisms of the Thomist, Scotist, and Ockhamist varieties. As opposed to what we find in Northern Europe, the use of these various positions here does not usually signify any adherence to a certain school. On the contrary, bits and pieces of the divergent traditions are used in an “eclectic”

manner (Kärkkäinen and Lagerlund 2009; Schmitt 1983, 99–103); or, better, the varying positions are employed in order to offer a coherent picture over and beyond the disagreement of the schools (cf., e.g., Hasse 2004, 137).

With regard to the ontological perspective, there are many different views on the status of the intellect (for the following, Keßler 1988, 488–507; Keßler 2008, 139–183). For instance, Paul of Venice and Nicoletto Vernia († 1499) championed the Averroistic idea that man's highest individual form is the cogitative soul (*anima cogitativa*), and not the rational soul or intellect. Vernia, for instance, presents the Averroistic position as the genuine Aristotelian one. Averroes assumes that the intellect is one single entity and common to all men and thus is supra-individual. The medieval tradition posits an agent intellect as the part of the intellect that abstracts the universal notion from the singular phantasm by preparing an intelligible species. This species then informs the possible intellect by which cognition takes place. In Averroes's interpretation there is no such distinction, both "intellects" are the same and exist as a single, supra-individual entity. This interpretation does well to explain how cognition is possible (especially the knowledge of universals); however, it does not easily explain the relationship between the single and universal intellect and the individual who is supposedly cognizing. When it comes to the relation between the supra-individual intellect and the human (cogitative) soul, various positions can be found in Renaissance philosophy: Paul of Venice views the intellect as an informing form (*forma informans*), while Alessandro Achillini († 1512) describes it as an informing and assisting form. Achillini, like Agostino Nifo († after 1538), believes that the intellect together with the cogitative soul comprise the one substantial form of man. This position is indeed reminiscent of Siger of Brabant († ca. 1284), who, in his *De intellectu*, held the substantial form of the human being to be the (possible) intellect together with the cogitative soul (Nifo 2011, 345–347; Nardi 1945, 13–29). Gaetano da Thiene († 1465) defended Averroism; however, he combined it with the Latin tradition,

mostly by integrating it with the positions of Albert the Great. In this sense, he attempted to give an Averroistic account of Church doctrine.

The Alexandristic interpretation – going back to Alexander of Aphrodisias (second/third century CE) – held that the soul is a form educed from matter and hence is generated and perishes with the body; this view was defended, for instance, by Pietro Pomponazzi († 1525) and Simone Porzio († 1554), at least on the grounds of purely natural or philosophical reasoning (Keßler 1988, 519–521). Both emphasize thus the individualistic perspective: the soul or intellect is an individualized human capacity. It is this man who cognizes, and thus the soul must also cease when her subject ceases to be.

Philipp Melanchthon († 1560) develops a "Protestant" Aristotelian psychology. He takes up the traditional distinction between the agent and possible intellect and develops it further. He presents the agent intellect as the faculty of *ingenium* or invention, while the possible intellect is the faculty of reception (Keßler 1988, 516–518). Melanchthon's reinterpretation displays well his Renaissance background, in which the idea of invention or creativity is strongly emphasized. The notion of *ingenium* then plays an important role in J. C. Scaliger († 1558), A. Persio († 1610), and G. Bruno († 1600), and its traces are found in R. Descartes († 1650) and F. Bacon († 1626) (Leinkauf 2001).

A Neoplatonic approach is present already in the late Nifo. He makes use of the Neoplatonic conception of metaphysical participation and, in particular, the distinction between different forms in order to distinguish between the unity of the universal intellect and the individual intellects proper to particular men. He differentiates between three agent intellects: (i) God, (ii) the principle in the individual soul (i.e., the traditional agent intellect), and (iii) the "prime notions [...] through which, as a mere instrument, God illuminates the human soul" (Keßler 1988, 498). Thereby, he shifts the emphasis from an active agent intellect that prepares the phantasm to a "passive" intellect that takes part in God's knowledge of things. The "real breakthrough," however,

of Neoplatonism into Renaissance psychology was witnessed only with Marcantonio Genua (Keßler 1988, 524). In Genua, Aristotle is read through the lens of Simplicius: the human soul is examined as part of the cosmological hierarchy, a middle sort of being between the immaterial and material realm.

Turning to the epistemological perspective in particular, the operations of the intellect are of prime concern. Here, the two extremes of the medieval tradition regarding the acquisition of knowledge are also present: on the one hand, the (Neo-)platonic conception of innate principles or ideas, and, on the other, the Aristotelian process of abstracting the universal from the particular. Marcantonio Genua († 1563), for instance, followed the Platonic tradition, understanding cognition as “mere reception of the universal forms emanating from the agent intellect,” while Porzio considers it to be a “mere reception of the intelligible *species* impressed by the illuminated *phantasma*.” Francesco Piccolomini († 1607) holds a middle position between both extremes: the process of cognition is “a true operation of the soul, through which the intellect produced the content of intellection by reasoning and judging the material image” (Keßler 1988, 528). Accordingly, Piccolomini assumes that the agent intellect, the faculty responsible for abstraction, is part of the human soul. Giacomo Zabarella († 1589), who opposes Piccolomini’s account and follows Genua, understands the agent intellect to be the divine cause of cognition and denies it any activity. Zabarella then assigns the active part of intellection to the possible intellect (Keßler 1988, 530–534). Another middle position between the Aristotelian and (Neo-)platonic approach is Melanchthon’s idea of innate principles within an Aristotelian conception of cognition. Melanchthon starts with the nominalistic differentiation between intuitive and abstractive cognition and with a preference concerning the immediate cognition of the singular. To support the intuition of singulars, he assumes the existence of innate ideas that render superfluous an abstractive function of the intellect. The agent intellect instead is the capacity for creativity (see above).

Innovative and Original Aspects

One of the best known and perhaps the most innovative aspect of these discussions is to be found in the “immortality debate.” To be sure, even this discussion has medieval roots (cf., e.g., Siger of Brabant’s revision of his *De intellectu*), but in the Renaissance its force is considerably stronger (for the following, Blum 2007; Casini 2007). The debate began with Georgios Gemistos Pletho’s († 1452) observation that there is present in Aristotle an inconsistency: in the *De anima*, the human mind seems to be immortal, while in the *Ethics* it is not. Pletho thus assumed that Alexander’s view that the human intellect is mortal is the correct interpretation of Aristotle. The ensuing debate concerned the correct interpretation of Aristotle, and then how this interpretation relates to Christian faith or Church doctrine. Marsilio Ficino († 1499) initiated this debate with the observation that there are two “sects,” namely, the Alexandrian interpretation that views the soul to be mortal since it is educed from matter and the Averroistic interpretation, according to which the intellect is immortal qua supra-individual while the individual soul is mortal. Both interpretations, according to Ficino, stand against the teaching of the Church and are dangerous to the faith (Ficino 1959, vol. 2, 1537). These positions were discussed extensively in Padua, at least until 1489, the year in which bishop Pietro Barozzi’s decree prohibited any discussion concerning the unity of the intellect. Barozzi explicitly praises Antonio Trombetta’s refutation of the Averroists, which he published some years later. Nicoletto Vernia, a fervent Averroist before, now became an anti-Averroist. In 1492, following Ficino and Albert the Great, Vernia now assumes a plurality of intellects against the Averroists and maintains that the opinion of the Church converges with the perspective of natural philosophy (Vernia 1998, esp. 56–57). The bull *Apostolici regiminis* of the Fifth Lateran Council (1513), which decreed that natural philosophers must uphold the immortality of the soul, follows the same line of reasoning. Nevertheless, in 1516, Pietro Pomponazzi published his famous *De immortalitate animae*, in which he argued for a twofold nature of man, his intellect, and his soul, viz., a mortal and an

immortal one. He made use of the scholastic distinction between the absolute consideration of something (*simpliciter*) and a relative one (*secundum quid*) (Pomponazzi 1990, 6, 10). The human intellect “is free of body as subject but relies upon body as its object (i.e. it relies on corporeal experience as its object)” (Blum 2007, 220), or, put differently, the intellect is material in its existence and immaterial in its function (Cassirer 1999, 92–93), which means that it is, *simpliciter*, perishable (viz., in its being), and immortal *secundum quid* (viz., in its function). For Pomponazzi, this perspective follows according to a purely philosophical point of view (for Pomponazzi’s epistemology, cf. Rubini 2015). From the point of view of faith, however, the immortality of the soul is still possible. Pomponazzi thus argues for the Averroistic double truth, i.e., that there are two truths according to two epistemological realms: that of philosophy and that of faith. In the end, the immortality of the soul is, for Pomponazzi, an unsolvable problem (*neutrum problema*) (Pomponazzi 1990, 228). Against the background of the bull of 1513, Pomponazzi met harsh criticism, especially from Gasparo Contarini († 1542), Bartolomeo Spina († 1546), Ambrogio Fiandino († 1532), Nifo, and Crisostomo Javelli († ca. 1538), who defended the traditional position of the Church concerning the immortality of the soul considered also from a purely philosophical point of view (Blum 2007, 223–227).

Impact and Legacy

The various medieval and Renaissance approaches to the intellect were picked up and further elaborated especially in Hispanic (or Second) Scholasticism and were thus transferred to Descartes and the Early Modern period. Descartes’s *Meditations*, especially, must be understood precisely against the background of the immortality debate of the Renaissance (Blum 2007, 227–229). The precise causal relationships or influences existing between Renaissance and Early Modern psychology must still be determined by future research.

Intellection, Renaissance Concept of

José Manuel García Valverde
Departamento de Estética e Historia de la
Filosofía, Universidad de Sevilla, Sevilla, Spain

Abstract

From the point of view of Aristotelian psychology, intellection is the culmination of a complex and multifarious process in which all

the powers linked to knowledge intervene, from sense perception to the intellect. This process has been the subject of a multitude of discussions and an endless number of works focused, in the majority of the cases, on the commentary of Aristotle's texts. Into this field, several questions concerning intellection have been dealt with, among which the relation between sensible forms and the so-called intelligible species was of particular importance. Also, the implications of our own intellectual activity for the debate over the immortality have been explored with great attention during the Renaissance. In this sense, many authors have discussed whether intellection must be understood as the product of a faculty essentially independent from the body and immortal or as a mere abstraction which is impossible without the presence of sensible data. Moreover, from a specific epistemological point of view, the logical mechanisms of reasoning were studied by many Renaissance philosophers. In this case, the point of departure was the significance of intellection as the direct apprehension of the first principles and the most general concepts of each science.

Heritage and New Approaches

From an Aristotelian perspective, intellection must be understood as the culmination of the process that leads from the perception of the sensitive image to the apprehension of the intelligible form (essence or universal concept) of a given object in a specific scientific field. This process, enormously complex and discussed, has been the object of study by Renaissance philosophers just as it had been by many medieval authors (Spruit 1995, 3–17). The Renaissance views of this question have been diverse (Kessler 1988, 485–534), but in general they can be included in two broad interpretative lines that are, nevertheless, interdependent. One of them was placed within what an Aristotelian considered a branch of natural philosophy, that is, the psychological study of the gnoseological faculties which are present in the human being (Zabarella 2016, 171–178). The other was in the field of method and logic from

where some authors tried to unravel the procedures that constituted the most important achievement of the act of thought, that is, science.

The large and multifarious number of interpretations made of Aristotle's *De anima* throughout history shows that the texts of the Master in this area, far from offering a closed and definitive doctrine, have left many problems unresolved (Perrone Compagni 1999, viii–xviii). However, it is undeniable that those texts have always been a constant stimulus for reflection which has compensated for Aristotle's lack of concreteness and the ambiguity in dealing with the topic of the intellective soul. For him, if the intellect is called to receive the intelligible form, just as the senses receive the sensitive one, it must have no previous form that hinders such a reception (Zimara 1562, 188). Hence, it is said in *De anima* III, 4, that the intellect "has no other nature except its capacity to receive." A little lower, Aristotle defines the act of thinking as a kind of identification between the subject of this act, that is, the intellect, and its object, that is, the intelligible, since "theoretical knowledge and its object are identical." But, even if the intellect lacks a concrete nature, in *De anima* III, 5, it is said that we can find in it a passive principle, which is capable of becoming all things, and an active principle capable of making all of them. The Aristotelian authors, especially since Alexander of Aphrodisias, have spoken of a patient or material intellect and an agent intellect (Nifo 2011, 385–439). The interrelation of these two intellects, their differentiated or undifferentiated substances, as well as their presence in the human soul have been questions constantly debated by many Renaissance thinkers. Moreover, the impact of these questions on the controversy about the immortality of the soul was enormous (Di Napoli 1963, 7–20). In this case, the proliferation of opinions has fluctuated between that of those who maintained that the intellectual faculty has no autonomous entity beyond being just a mere development of sense perception and that of those who have underlined, in many different ways, its substantial character and its separation from the body. In this sense, the sensitive dependence of the intellective act, which Aristotle clearly affirmed in more than one passage, always involved an objection addressed against the

independence and autonomy of human thought. In spite of it, some Renaissance Aristotelians affirmed that the sensitive images are by themselves incapable of becoming those intelligible species that our mind contemplates, so it is necessary to postulate a higher faculty which possesses the power to extract an intelligible and immaterial nature from what is singular and linked to matter. To do it, this faculty has to be intelligible and immaterial by itself, existing as a separable, unmixed, and imperishable substance.

Otherwise, from a methodological point of view, the logical and empirical procedure that leads from singular data to universal concepts has been approached with great zeal throughout the sixteenth century, particularly in the area of the University of Padua (Poppi 1970). In this case, the syllogistic structure of scientific thought has been studied, as well as the nature of that intuitive act of intellection that is capable of capturing the first principles of each science.

Interest of State

► Reason of State, Renaissance Concept of

Intuition, Renaissance Idea of

Matteo Cosci

Università Ca' Foscari Venezia, Venice, Italy

Abstract

From Nicholas of Cusa to Spinoza, intuition is regarded as a form of superior knowledge or direct insight, whose peculiar object of understanding is usually intended as some universal concept and even as some holistic, divine truth, usually with mystical flavor. In this framework, Cartesian intuitions stand out, since they are regarded as just dependent on the simple and evident nature of their elementary objects, whenever considered under the enlightening power of the human mind and evaluated through methodical doubt.

Heritage and Rupture with the Tradition

Many different elements contributed to shape the Renaissance concept of intuition: first of all the Platonic and Neoplatonic notion of intellect (*noûs*) as different from propositional reason (*dianoia*); secondly the Christian idea of intuition as mystical “vision of God” (objective and subjective genitive), mediated by the Augustinian idea of “*intueor*” as a form of intimate insight or inner contemplation; and finally many influences in this regard came from Gnostic-Hermetic, Orphic, and even Cabalistic texts, which intended intuition as a sort of direct glance on the infinite whole of the universe (Pozzi 2012a, 81). At the same time, the idea of intuition as an acute and quick way of understanding clear-cut concepts starts to find its epistemological role within proto-scientific methodologies.

For Nicholas of Cusa, intuition (*intuitio* or *visio intellectualis*) is the highest level of knowledge. It is provided by the faculty of intellect (*intellectus*), which is regarded as superior even in comparison to propositional reason (*ratio*) because – as he stated in his *De coniecturis* – only in virtue of the former all the contradictions can be simultaneously embraced as one and understood as unified. As a result, even logical opposites are grasped as overlapping within the intellect (the so-called *coincidentia oppositorum*). For him intuition should not be understood as “passive contemplation” (Cassirer 1927, 14) but as the active work of the most prominent part of the human mind, well beyond its power of conceptualization. All the other cognitive faculties can provide some true knowledge only in reference to the intellect, because only the latter partakes of the divine. Lastly, only God’s insight of us parallels the power of human intuitive understanding, since, as it is stated in his *De Visione Dei*, these two acts are reciprocal.

For Marsilio Ficino, intuition always depends on divine perpetual illumination (*perpetuo lumine*), which is constant upon human mind (*mens*). Since our minds depend on the divine mind, the intuitive content that each created mind can grasp is fundamentally God himself, present at a deep level as immanent truth. So human *mens* constantly mirrors the divine truth by its activity of inner contemplation and noetic self-reflection, which can even be unconscious and unintentional. It is just the faculty of *ratio* which later attributes awareness to our intuitions, but the intuitive activity of *mens* can be “even substantial and unaware” knowledge (Kristeller 1988, 410–412) of intelligible realities. Finally, Ficino merges together Platonic *eros* and Christian *agape* within the activity of *mens*, where the love for the world is sublimated into the love for God (*De Amore*, IV).

On his turn, Giordano Bruno provided some original images for explaining what he means for *cognitio intuitiva*: it is a sort of internal reading voice which allows us to understand directly what reason can only explain through discursive argumentations; it is a sort of a living mirror, which has and receive in itself the objects of its

own reflection; it is a naked eye viewing of the sun (“*sicut oculos circa solem*”). Our insight can have a total view of the whole just once it has glimpsed the first source of light and visibility (*Summa Terminorum Metaphysicorum*, s.v. *cognitio*).

For Tommaso Campanella intuitive knowledge (*scientia intuitiva*) is a form of contemplation up to the point of identification and unification with its object. So the intuitive act is a joint interpenetration (*intrinsecatio*) of the intuitive subject and of the intuited object where both of them become one another (*unum fit aliud*), mutually transforming their nature. The intuitive identification can reach its completion in a mystical union with the entire universe and, at its most, it ends with the pure vision of God.

According to Descartes’ *Regulae ad Directionem Ingenii*, intuition (*intuitus*) is, together with rational deduction, the most fundamental cognitive act, being the most certain and infallible, and even more important than deduction, because intuition is more antecedent and basic in its respect. For, every deductive moment (both each step and each inferential connection) is firstly understood as such by the intuitive way. In one of his *letters to Mersenne* (16 October 1639), he equals intuition with our mental “natural light” (*lumen naturale*) “which alone ... one should really trust” (II, 59). Intuition stays as a separate faculty from the others, and it deals just with pure conceptualization (*conceptum mentis purae*) of non-mediated truths. So, e.g., “that I think” (*cogito*) is a truth intuitively understood, so as it is “that I exist,” as well as it is so the inference that from the self-awareness of being thinking leads to the certainty of existing (as this latter, some truths can be understood both by intuition and by deduction). In *Meditations on First Philosophy*, Descartes refers to intuition as a form of preexisting knowledge gained through attentive contemplation. For him, intuitive comprehension is possible because of the *simple* and *evident* nature of the basic elements of its understanding, which can never be the source of error or wrong in themselves. More specifically, intuition has the power to reduce and simplify complex objects of knowledge into their

constitutive elements, perceiving immediately their essential factors as true (Mursell 1919, 395). Nonetheless, intuitions too should be inspected through the examination of methodic doubt in order to gain our rational assent (Van de Pitte and Frédérick 1988, 460–1).

For Spinoza, *intuitive science* is the third and most important level of cognitive understanding, over perception and reason. It entails the immediate and simultaneous knowledge of particular essences (*res singulares*) and the relevant substantial attributes of God or nature (*Deus sive natura*). Spinoza’s intuition plays a fundamental scientific role in the process of knowledge (Cristofolini 2009), because it provides the knowledge of particulars within their whole framework, and the truths that it can attain are self-evident so that the mind can be independent from God in regard of their right assessment. From this sort of comprehension arises the eternal intellectual love of God (“sub specie aeternitatis,” *Ethica*, V, 31–32). Finally, Spinoza’s conception of intuition maintains also Hebrew and oriental elements, since for him intuition was not just a matter of unmetaphorical “seeing” but also of “hearing” (as the Abrahamic tradition said), and, secondly, the intuitive knower ends up with dematerializing himself into the known object and vice versa (as Pierre Bayle first noted in his *Dictionnaire Historique et Critique* (1740⁵) about the Spinozian idea of intuitive emptiness perhaps borrowed from the Chinese philosophical sect of Foe Kiao).

Abstract

The recovery of ancient rhetorical sources which took place in fifteenth-century Italy went hand in hand with humanists' concern for social and political issues. Consequently, humanists' reappropriation of such authors as Cicero and Quintilian came to broaden Aristotle's main achievements on rhetoric. Similarly to other practical-oriented disciplines (such as law, medicine, and moral

philosophy), rhetoric provided a model for teaching and discussing. Humanists dealt with the most appropriate use of *inventio* as a tool for building up persuasive discourses. In doing so, they could not eschew from challenging the traditional rhetorical scheme put forward by the leading lights of classical oratory.

Later on, the sixteenth- and seventeenth-century reflection on method emphasized the eminently epistemological nature of *inventio*, by connecting it to the inductive type of knowledge.

Heritage and Rupture with the Tradition

The origin of the term “invention” has to be traced back to the Latin word *inventio*. Originally, the term was referred to the mental process responsible for finding compelling arguments to support discourses (*Rhetorica ad Herennium*). In the traditional Aristotelian scheme, *inventio* was the first part of rhetoric, its aim being to set forth rhetorical syllogisms, the so-called *entimemata*. Later on, Aristotle's scheme was also endorsed by Cicero (*De Oratore*, *Orator*, *Brutus*) and Quintilian, who clearly resided upon his *Rhetoric* while unfolding their own view on the different parts of discourse. According to this view, *inventio* still occupied the foremost position; however, Cicero and Quintilian set out to enrich Aristotle's scheme by adding *memoria* and *actio* to *dispositio* and *elocutio*. Moreover, the relation between rhetoric and politics (that is to say, the dimension of persuasion) is dealt with by early Christian mind with a clear religious meaning. The writings of such authors as Tacitus (*De oratoribus*), Pseudo Longinus (*Peri h ypsous*), and Augustine of Hippo (*De Doctrina Christiana*; *Pseudo-Augustine, Principia Rhetorices*), while presenting the very same goals as classical oratory – i.e., *docere* or *probare*, *dilectare*, *movere* –, looked at rhetoric as an instrument enabling them to attain the true knowledge of God.

When humanists began to be committed with the recovery of classical heritage, they also began to consider the Greek-Latin rhetorical scheme as a system of teaching and discussing. Quintilian's

Institutio Oratoria became a central source within the new pedagogical program, and *inventio* turned out to be an essential part of pupils' civic education. Humanists such as Lorenzo Valla (*Elegantiae Linguae Latinae, Dialecticae Disputationes*) and Rudolph Agricola (*De inventione dialectica*) dealt extensively with *inventio* as a tool for selecting argument. They considered *entimema*, *exemplum*, and induction as essential logical components of any discourse on knowledge. The realm of truth was no longer restricted to demonstrative logic only (as in Aristotle's *Prior* and *Posterior Analytics*), for this "new" rhetoric was meant to include also the sphere of probable and possible knowledge. Dealing with the traditional catalogue of liberal arts, such humanists as Agricola, Angelo Poliziano (*Silvae, Lamia*), and Giorgio Valla (*De expedita ratione argumentandi Libellus*), claimed that the arts of *trivium* – grammar, rhetoric, and dialectics – might play as example for other human arts, such as medicine, law, and moral philosophy (Vasoli 2002). Like these disciplines, rhetoric has to do with changeable and uncertain matters: the rhetor has therefore to take into account a sheer number of elements if he wishes to achieve persuasion (Cicero, *De inventione*). Accordingly, while considering ancient topical works as an indispensable tool for building persuasive discourses, *inventio* must go in quest of unexplored *loci*: the *selva oscura* of knowledge needs to transform into a tidy *hortus* in order to make *inventio*'s job easier. *Topica* and *inventio* may be compared to the tags on ampoules helping physicians to distinguish and combine the different remedies correctly (Vasoli 2002). Humanists did not deny their preference for Cicero's *Topics* over Aristotle's, being the former work more systematic and rooted in the real experience of rhetor and lawyer (Vasoli 2007).

The interrelation between rhetoric and dialectics becomes all the more evident in the reflection on method taking place in sixteenth- and seventeenth-century Europe, a reflection which led to a general reassessment of such notions as induction and deduction (Gilbert 1960). Unsurprisingly, in Petrus Ramus' work (in *Dialecticae*

Istitutiones first and in *La Dialectique* later), *inventio* turned away from the merely rhetorical sphere as it came to be absorbed by dialectics (a move which is consistent with the view once held by Agricola).

Ramus located *inventio* much closer to the syllogism, being that too involved in the search for the middle term. In order to avoid all the earlier discussions about categories and predication, Ramus assigned a very general meaning to the term *loci* (as simply "arguments") and provided an eminently topical orientation to logic (Ong 1958). The renewal of logic and the employment of *inventio* are evoked by Francis Bacon in his analysis of method. In *The Advancement of Learning* (then *De Augmentis Scientiarum*), Bacon made a sharp distinction between *inventio* of arguments and *inventio* of experiments, a distinction which in his opinion may contribute to the "advancement of learning." The "new organon" is a new logic which gets back to the original meaning of *inventio* (as "investigation"), while stressing at the same time the experimental-oriented nature of this notion.

Irony, Renaissance Idea of

Véronique Montagne

CNRS, BCL, UMR 7320, 98 Bd Edouard Herriot,
Université Nice Sophia Antipolis, Nice, France

Abstract

During the Renaissance, irony was seen as a macro-textual figure that could run through an entire discourse and/or as a trope (or microtextual figure), with irony being built on a succession of tropes. This classification issue – already present in Quintilian's work – also appears in Antoine Fouquelin's *La rhétorique française* (1555; French Rhetoric); while irony is among the tropes analyzed, the author also identifies a type of “extended” irony (Fouquelin 1990).

- Cox, Virginia, and Ward, John (eds.). 2006. *The rhetoric of Cicero in its medieval and early renaissance commentary tradition*. Leiden: Brill.

Synonyms

Dissimulatio

Inherited Definitions

The tropes constituting irony are extremely diverse. Fabri's *Le grand et vrai art de pleine rhétorique* (1521; The Great and True Art of Rhetoric) is based on a classification system that has been used since antiquity (Quintilian 1932), differentiating between antiphrasis (which may be based on preterition), praise (simulated), "repugnance" (the speaker concedes a fact to discredit their opponent), "non-injurious" confession (or concession), permission (to agree at the right moment on certain incriminating facts), and mockery (Fabri 1969). Like Quintilian, Melanchthon, and Soarez (1569), Mosellanus examines irony and antiphrasis as specific types of allegory in his *Tabulae de schematibus et tropi* (1516). This "odd" classification (Le Guern 1976) is the result of allegory being commonly seen as inversion, a device that presents a meaning different from what is expressed on the surface. Verbal types of allegory include enigma, irony, sarcasm, proverbs, urbanity (*astysmus*), antiphrasis, and artfully veiled insults (*charientismus*) (Mosellanus 1533). In *Thesaurus rhetoricae* (1599), Bernardo cites numerous techniques mentioned above, adding a trope introduced by Rufinianus in *De figuris sententiarum et elocutionis: chleuasmos*, or *epicertomesis*, a "verbal act of self-accusation" that must deceive the listener or reader (Molinié 1992).

The wide range of linguistic processes is further enhanced by gestures. Melanchthon evokes a form of criticism expressed by *mycterismos* (Quintilian 1932), a movement of the nostrils (Melanchthon 1532) that is both hostile and opposed to any restraint.

Irony is thus a category encompassing multiple figures with different meanings and effects, depending on the context in which they are used. Wecker's *Artis oratoriae praecepta* (1582) clearly recognizes the ambivalence of the concept. Wecker examines *ironia*, or *dissimulatio*, identifying two categories: urban irony and hostile

irony. While hostile irony is thoroughly explored in the essay, Wecker only cites two processes for urban irony: *asteismos*, which aims only to please and is linked to urbanity and playfulness, and *charientismus*, which is associated with euphemism (Wecker 1582).

Israel of Toledo

Flourished: 13th century, Toledo, Spain.

Beatrice Variolo
The Johns Hopkins University, Baltimore,
MD, USA

Abstract

Hayyim ben Israel was a Spanish Jewish philosopher and author who lived in Toledo in the thirteenth century. He is a descendent of the well-known Israeli family from which came a number of distinguished scientists. Hayyim ben Israel wrote three works, but only one survives: the *Ma'amar Gan-Eden* or *Treatise on the Paradise*. In the book, Hayyim ben Israel discusses the physical location of the Paradise, widely drawing from Avicenna's *Kitāb al-Shifā'* (the *Book of Healing*). He is one of the few Jewish scholars who consistently and decidedly took Avicenna's side over Averroes.

Alternate Names

[Hayyim ben Israel](#)

Biography

Very little is known about Hayyim (often spelled Hajjim) or Chaiim ben Israel's life, Jewish philosopher and scholar who lived in Toledo in the second half of the thirteenth century. He hailed from the prominent Israel family, a well-known family of copyists whose name appears in several manuscripts copied in Toledo in the thirteenth century. Hayyim ben Israel was a relative of Isaac Israeli ben Joseph, author of the astronomical treatise *Yesod 'Olam* (*The foundation of the World*), considered the best contribution on this subject to Hebrew literature.

Hayyim ben Israel was a copyist himself and transcribed, in 1277, the *Parma's Bible* (Ms. parm. 2668 of the Biblioteca Palatina). Pietro

Perreau, an Italian scholar who was the first to study Hayyim ben Israel, attributes to his hand also "a codex 26 of Paris" copied in 1272 for a "Moses ben Josef" (Perreau 1884, 141).

Modern scholars of medieval Jewish philosophy (Sirat 1985; Freudenthal and Zonta 2013; Schwartz 2005) date Hayyim ben Israel's philosophical writings to the second decade of the fourteenth century. He is known to have composed at least three scientific treatises, but only one, *Ma'amar Gan-Eden* (*Treatise on the Paradise*) is extant. Hayyim ben Israel is probably the translator into Hebrew of Avicenna's *Urjuzah fi l-tibb* (*The canon of medicine*), a iambic poem on medicine.

Innovative and Original Aspects

Hayyim ben Israel's only surviving work, the *Treatise on the Paradise*, is a comment on a biblical commentary written in the eleventh century by the philosopher, exegete, and astronomer Abraham Ibn Ezra. The treatise consists of an introduction followed by eleven chapters in which Hayyim ben Israel discusses the location of the Paradise, often explicitly drawing from Avicenna's *Kitāb al-Shifā'* (*Book of Healing*). Hayyim ben Israel refers to the Muslim philosopher's distinction between First Cause and First Mover. He juxtaposes to the scholars that read in the movements of the celestial spheres proof of the existence of God, Avicenna's position, according to which the Creator is the cause of the First Mover, not the First Mover itself. In a successive chapter, Hayyim ben Israel reformulates Avicenna's theory, taken from the astronomical section of the *Kitāb al-Shifā'*, that the equator is the most balanced region of the earth. He, moreover, mentions Avicenna's account, presented in the meteorological section, of the dry land.

Hayyim ben Israel not only reports Avicenna's views, but he also juxtaposes them to Averroes' one, firmly taking the former's side. According to the Jewish philosopher, Averroes lacked the necessary training in both natural philosophy and astronomy to fully understand these astronomical issues. Although his work is not

influential, Hayyim ben Israel is, together with Samuel Ibn Tibbon and Moses ha-Levi, one of the few scholars who, in a panorama of general Averroist's consensus, consistently sides with Avicenna. He embraces Avicenna's opinion asserting that his naturalistic account perfectly coincides with what is affirmed in the *Torah*.

Hayyim ben Israel's enthusiastic admiration for Avicenna seems to support the hypothesis that he was behind the translation of the *Urjuzah fi l-tibb* (*The canon of medicine*).

Avicenna is not the only Muslim philosopher that influenced the *Treatise on Paradise*. Hayyim ben Israel's theory of the intellect elaborates and combines al-Kindi and al-Farabi's quadripartite division of the intellect.

Ivani, Antonio

Born: 1430, Sarzana

Died: 1482, Pistoia

Michele Lodone

Scuola Normale Superiore, Pisa, Italy

École des hautes études en sciences sociales,
Paris, France

Abstract

Humanist and politician, Antonio Ivani was born in 1430 near Sarzana and died in Pistoia in 1482. His fame is mainly due to his work as historian and particularly to his *Historia de Volaterrana Calamitate*, yet Ivani's historical interests can be explained in a broader context of cultural curiosity shown in his rich collection of Latin letters. Besides several reflections about the contemporary political world – with particular attention toward Turkish expansion – in Ivani's letters can be found some important reference to the Florentine myth, to the rediscovery of the Etruscan antiquities, and to the coeval philosophical trends, toward which the interest of the author was devoted in particular to Hermeticism and to Marsilio Ficino's production.

Biography

Humanist and politician, Antonio Ivani was born in 1430 near Sarzana, a small town at the boundaries of Liguria, Tuscany, and Emilia, contended, in those years, by the Republic of Genoa and by the Medicean Florence. After a bureaucratic and scholarly education that led him to Narni, as a public chancellor, and to Ferrara, where he attended the lessons of the by then old Guarino Veronese, he worked as a public notary in his hometown, before passing in 1461 at the service of the Doge of Genoa Ludovico Fregoso.

The important diplomatic missions of those years led him to Florence and Milan, where he became friend to Cicco Simonetta. Thanks to the

Milanese recommendation, in 1466 he gained, for Piero De Medici's wish, the mandate of chancellor of Volterra which he held until 1471, when he was forced to quit following some bribery charges.

The defeat of the pro-Florentine faction in Volterra led in 1472 to the siege and raid of the small town by the military force of Federico da Montefeltro, hired by Lorenzo de' Medici. In the following year, Ivani finished the composition of the *Historia de Volaterrana Calamitate* (Ivani 1913), whose literary and descriptive qualities were appreciated by historiography, even though a certain factiousness in favor of the Medici family could be detected. And it was just for Lorenzo's recommendation that Ivani was elected in 1477 chancellor of Pistoia, a role that he held until his death, which occurred in 1482 (Simonetta 2004).

Heritage and Rupture with the Tradition

The character of Ivani – whose political commitment was in large part devoted to smooth out the contrasts, in the Tuscany of the fifteenth century, between the central power and the local self-rules – can rightly enter the tradition of civil humanism. In particular, we can find an original usage of the terms “useful” and “honest,” within the ambit of a theorization of the decline of the communal self-rules, in the *De temperamento victoriae et moderatione animorum*, written in January 1479, in the middle of the violent political crisis following the Pazzi conspiracy (Fubini 1994; Simonetta 2004).

Yet the fame of the humanist from Sarzana is mainly due to his work as a historian: a work that did not confine itself to the popular history of the ruin of Volterra. He also proved himself to be skillful also in several other minor writings (*Expugnatio Constantinopolitana*, *Historia de excidio Lunae*, *De Nigropontis expugnatione*, and others), at last available also in critical edition (Ivani 2006).

Ivani's historical interests can be explained in a broader context of cultural curiosity shown in his Latin collection of letters, about 700 pieces and still only partly published (Altamura 1956; Ferrari

1965; Landucci Ruffo 1965). Besides several reflections about the contemporary political world – with particular attention toward Turkish expansion – in Ivani's letters can be found some important reference to the Florentine myth, to the rediscovery of the Etruscan antiquities, and, after the failure of the Volterra's experience, also to the coeval philosophical trends, toward which the interest of the author was devoted in particular to Hermeticism and to Marsilio Ficino's production.

With Ficino himself, celebrated as *fons Platonis*, Ivani was in close contact during the years he spent in Pistoia: while in a letter to Rosso di Matteo Cerretani, the humanist hinted, against every mechanistic interpretation of the universe, at the hermetic doctrines, placing peculiar emphasis on moral life and on the exaltation of the soul, defined as divine form of the material body, completely free from the stars and from Fortune's influences (Altamura 1956; Landucci Ruffo 1965).

Finally, in the letters, there are some critical hints to superstition and to the supernatural phenomena of the time, toward which the author shows, nevertheless, a certain interest. And it is also in the light of his responsiveness toward the Turkish menace that we can explain Ivani's apocalyptic interests, hence the passionate reading of *Pronosticum super Antechristi adventu Iudeorumque Messiae* by Iohannes of Lübeck (1474) – a text not devoid of analogies with Ficino's prophecy *Deus ubi vult spirat* (Landucci Ruffo 1965).

Jack, Gilbert

Born: Aberdeen, 1578

Died: Leiden, 18 April 1628

Victor M. Salas

Sacred Heart Major Seminary, Detroit, MI, USA

Abstract

Gilbert Jack was a sixteenth-century philosopher and physician who was born in Scotland but eventually attained celebrity in the Netherlands as one of the Low Countries' most famous metaphysicians.

Biography

Gilbert Jack (Jacchaeus) (Aberdeen, 1578–Leiden, 18 April 1628) was a reformed Scottish philosopher (Schmutz) who left a lasting mark on Dutch thought. Both a physician and metaphysician, Jack began his studies in Aberdeen and then continued his education at Marischal College under the direction of Robert Howie (Pyle, 463). Jack completed his education at Marischal in 1597 and in the following year moved to Germany to pursue further education at the University of Helmstedt in 1598 (ibid.). With his philosophical course of studies completed, in 1603, Jack moved to the Netherlands and enrolled at the University of Leiden, where, like his mentor Howie, the

Scotsman took up theology (ibid.). Leiden would eventually become Jack's academic home, and he was first appointed as a *Professor Extraordinarius* of logic in 1605. This was followed in 1617 by an appointment to a chair in physics, which he held until his death in 1628 (ibid.). At Leiden, Jack counted among his students Cartesians and anti-Cartesians alike, including Heidanus, Renneri, Voetius, and Burgersdijk (Schmutz).

Jack's first work was his 1614 *Institutiones physicae*. The volume opens with a prefatory treatment of the nature of philosophy in general (c. 1), which, because of man's own faculties of intellect and will, is subject to division within itself (fols. 1, 2); the division of philosophy into natural, moral, and rational or, what is the same, the more familiar speculative and practical philosophy (c. 2); the nature of "contemplative philosophy," which he subdivided into metaphysics, physics, and mathematics (c. 3); and, finally, the constitution of natural philosophy or physics (c. 4), which has as its main consideration motion and pursues the principle of motion that all natural things have in themselves (fol. 7).

The first book of the treatise *De corporis naturalis principiis internis*, as its title suggests, explores at length the nature of the principles of corporeal things. It begins with a discussion of the nature of a principle in general (c. 1) before taking up in succession the three Aristotelian principles of motion: (prime) matter (c. 2), form (c. 3), and privation (c. 4). Book two of the *Institutiones physicae* addresses the concept of "nature," its definition, activities and passivity, distinctions

from art, and causality. The third book treats of motion, while the fourth book explores the nature of time. The fifth book offers Jack's astronomical thinking and discusses the movements of the heavens and celestial orbits. Book six concerns "mixed bodies" (*de corpore misto*) and contains discussions of the number of and nature of the elements, "first qualities," alteration, generation, corruption, and even putrefaction. Book seven contains Jack's meteorology in which there is discussion of meteors, thunder, rain, comets, the *Via Lactea* or Milky Way (c. 8), wind, rainbows, etc. In the eighth and final book, Jack addresses the nature of the soul. Here, Jack discusses embryonic gestation vis-à-vis vegetative, sensitive, and rational ensoulment.

Ten years later, in 1624, Jack authored his final treatise, a medical tract that explores a variety of topics related to the medical arts across six books. As is to be expected, the opening book addresses the nature of medicine in general, which he identifies in a threefold manner, namely, the "subject. . . division, and end" (fol. 1). Also unsurprisingly, Jack identifies the cure of the human body as the subject of medicine (*ibid.*). Thus, he says, while it is certainly the case that the human is considered within ethics, physics, and theology, in none of those sciences is the human being considered in relation to health (fol. 2). Subordinate to physics as a lower science and drawing its principles from the conclusions of physics, medicine pertains not only to the human body but also to the instruments (e.g., plants, metals, etc.) that produce health (fol. 2). The end of medicine is equally as obvious as its subject, namely, health and its preservation if it is already present or its restoration if it is absent (fol. 3). The remainder of the work addresses various illnesses (book 2), different kinds of symptoms and their causes (book 3), physiological signs of health (e.g., pulse, urine) and disease (book 4), the application of medication and medical treatments (book 5), and nourishment (book 6).

Abstract

Giovanni Crisostomo Javelli (ca. 1470–ca. 1538) studied theology under Tommaso de Vio (Cajetan); he was involved in the Pomponazzi controversy; he wrote extensive commentaries on the works of Plato and of Aristotle and composed numerous treatises in theology.

Alternate Names

Canapicius; da Casale, Crisostomo; Casale, Crisostomo da

Biography

Giovanni Crisostomo Javelli was born in 1470 (or 1472) in the Italian region of Canavese, possibly in San Giorgio (now San Giorgio Canavese). He entered the Order of the Dominicans in 1485, studied philosophy, and in August 1495 started to study theology in the school of Bologna. Then, he taught logic and natural philosophy there. Probably in these years, he elaborated his teachings in

Logicae compendium peripateticae (1540; 30 editions till 1629) and *Epitome super totam naturalem philosophiam Metaphysicam Aristotelis: necnon subtilissima enucleatio propositionum omnium in Librum de causis* (Javelli 1547). In 1507 he was assigned by the chapter of his Order to the school of Bologna, where he remained till 1512, when he moved to Milan. From 1513 to 1516, he taught again in Bologna. He graduated in theology on February 18, 1516, at the University of Bologna. From 1518 to 1521, he was regent of the school in Bologna and composed his commentaries of the introductory treatise of the first part of Thomas Aquinas' *Summa theologiae* (published for the first time in the 1596 Venice edition of Aquinas's *Summa*) (Giacon 1944; Lohr 1988; Tavuzzi 1990–1991).

He participated in the contemporary philosophical and theological disputes, in particular in the controversy raised by Pomponazzi's *Treatise on the Immortality of the Soul* (1516). He was asked by Pomponazzi himself to write a confutation of the arguments sustaining the mortality of the soul, published as *Solutiones rationum animae mortalitatem probantium* in the 1519 edition of the *Treatise*, as well as appendix in Pomponazzi's *Defensorium* against Agostino Nifo which appeared in the same year. Javelli returned to discuss this issue in *Tractatus de animae humanae indeficientia* (1536) (Gilson 1961). His interest in Plato's philosophy is witnessed by *Epitome in Ethicen, hoc est, moralem Platonis philosophiam* and *Epitome in Politicam, hoc est civilem Platonis philosophiam* (both: 1536), while his *Philosophia civilis Christiana* (1540) reveals the influence of Ficino. The fifth part of this book is devoted to the confutation of Luther's *De captivitate Babylonica Ecclesiae praeludium* (1520).

Javelli moved to Piacenza in 1523, where he published commentaries of Aristotle's natural philosophy. In 1532 he moved to Cremona, where he finished his comment on the *Metaphysics* and the *Politics* (1534 and 1536). In 1534 he also published his commentaries on *Physics* and *De anima* (Javelli 1555; Rhodes 1972).

In the controversy over the annulment of Henry VIII's marriage with Catherina of

Aragon, he defended Henry VIII, in contrast to his fellow friars of the Bologna school. He died probably in 1538 in Piacenza. His complete works, issued in 1568–1574, ran through four reprints until 1580.

Abstract

Johannes Jessenius was a physician, anatomist, philosopher, and politician. He introduced the anatomical concepts of the late Renaissance to Central Europe and promoted Italian Renaissance philosophy, in particular, that of Francesco Piccolomini, Francesco Patrizi, and Girolamo Savonarola, in the Central-European region.

Alternate Names

[Jesenský, Jan](#)

Biography

Jessenius studied at universities in Wittenberg, Leipzig, and Padua where he was tutored by the anatomist Girolamo Fabrici ab Aquapendente and the philosopher Francesco Piccolomini. He taught anatomy and surgery in Wittenberg starting in 1593. Jessenius hosted Tycho Brahe for 6 months in Wittenberg in 1599 and later played the role of moderator in the conflict between Brahe and his assistant Johannes Kepler. Jessenius moved to Rudolfin Prague in 1602 where he performed the first public dissection as early as 1600. He entered into the services of King Matthias of Habsburg in Vienna in 1608. He returned to Bohemia in 1617 and was elected rector of the University in Prague; as such, he undertook diplomatic missions in support of the Bohemian Estates revolting against the Habsburgs. Following the

Battle of White Mountain, where the revolt was suppressed, Jessenius was arrested and eventually executed.

Philosophical Works

Apart from a number of medical treatises (Pick 1926), Jessenius was the author of several philosophical books. His Leipzig dissertation (Jessenius 1618) deals with the immortality of the soul in the Aristotelian and Thomistic manner (Sousedík 2009). In his Paduan philosophical dissertation, Jessenius follows the Aristotelianism of his teacher Francesco Piccolomini and made a distinction between metaphysics and natural philosophy and between their different subjects and methods.

After his return from Padua to Silesia and Saxony, Jessenius published the book entitled *Zoroaster* (Jessenius 1593) in Wittenberg which is an excerpt from Francesco Patrizi's work *Nova de universis philosophia*. Jessenius does not mention, however, the actual source of his book and recommends this anti-Aristotelian work to the Saxonian Duke as consisting of Chaldean wisdoms of Zoroaster. In contrast with Patrizi's work, Jessenius omitted Patrizi's "Panaugia," shortened the remaining text, and changed the order of the books of "Panarchia," "Pancosmia," and "Panpsychia."

Jessenius published an edition of Girolamo Savonarola's *Universae philosophiae epitome* in 1596. In the dedication to the Saxonian Duke, he advocated a project derived from the works of his teacher Francesco Piccolomini involving establishing harmony between Plato and Aristotle with the help of Hermetic texts. Jessenius consequently attempted to fulfill this program of concord philosophy in the book *On the Soul and the Body of the Universe* (Jessenius 1605) combining Aristotelian and Platonic philosophy in an eclectic way (Nejeschleba 2014).

Jessenius was partially influenced by Tycho Brahe's thought in the treatise *On the Causes of Sympathy and Antipathy* (Jessenius 1599) which was a disquisition defended in Wittenberg by his pupil Daniel Sennert. Despite Brahe's Paracelsian influence, Jessenius explained the causes of

sympathy and antipathy rather naturalistically with a reference to Italian Aristotelianism and by means of the similarities and dissimilarities of manifest qualities.

As a political thinker, Jessenius published a treatise entitled *Pro vindiciis contra tyrannos* in which he defended the people's right to revolt against a tyrant (Jessenius 1620). The treatise paraphrases older works of “monarchomachs,” in particular *Vindiciae contra tyrannos*, and made Jessenius the “ideologist of the Bohemian revolt” (Sousedík 1995).

Jesuits in the Early Modern Period

Marco Rochini

Institute for Advanced Jesuit Studies, Boston College, Boston, MA, USA

Abstract

The Society of Jesus is a religious order founded by Ignatius of Loyola and officially approved by Pope Paul III on 27 September 1540 with the bull *Regimini Militantis Ecclesiae*. The structure of the Society of Jesus was regulated by the *Formula vivendi* and the *Constitutions*. It was an order of “clerics regular,” similar to those founded in the Tridentine age, but with a strong vocation for militant action in defense of the

Church. In order to make this objective concrete, the Society decided to renounce community life and prayer in chorus, so as to make possible the mobility necessary to satisfy the apostolic and missionary commitment for which the Society was founded. From the earliest years following their official recognition, alongside missionary activity the Society distinguished itself through its efforts in the field of education, opening numerous schools and colleges in the early 1550s. Education as a central activity in the life of the Society was more precisely defined during the course of the sixteenth century. The pedagogical system developed within the Society underwent continuous evolution, until a stable program was achieved in 1599 with the publication of the *Ratio studiorum Societatis Iesu*. This document, alongside the *Constitutions*, set out the regulation of studies of the Society. Thanks to the Society's educational activities, in the early modern age its colleges became important places of intellectual advancement in the theological, philosophical, and scientific fields.

Heritage and Rupture with the Tradition

The Foundation of the Society of Jesus

The Society of Jesus is a religious order founded by Ignatius of Loyola and officially approved by Pope Paul III on 27 September 1540 with the bull *Regimini Militantis Ecclesiae* (O'Malley 1995). Ignatius, who was baptized with the name Iñigo, was the son of a cadet branch of the nobility of the Spanish Basque country. He was born around 1491 and was educated in the principles of chivalry. In 1521, when conflict broke out between the Valois King Francis I and Spain, ruled by the Habsburg Emperor Charles V, Iñigo entered the Spanish army and took part in the defense of the city of Pamplona when it was besieged by French troops. In the conflict he suffered a serious leg injury; and during the long period of recovery, following many operations, he began a series of readings on themes such as the life of Christ, which greatly influenced his religious sensibility. Converted to a life of faith, Iñigo decided to

embark on a pilgrimage to Jerusalem, where he arrived in 1523. Returning to Europe, after a short time, he traveled to the most important universities of Spain, including Alcalá de Henares and Salamanca. Persecuted by the Spanish Inquisition for his alleged closeness to the Alumbrados movement, whose followers practiced a mystical form of Christianity, Iñigo decided to move to Paris, the main European center for the study of theology. In February 1528 he enrolled at the Collège de Montaigu and in 1529 at the Collège de Saint-Barbe. In Paris the original nucleus of companions forming the Society of Jesus took shape. Next to Iñigo, who from this moment began to call himself Ignatius, were two other figures: Pierre Favre (1506–1546) and Francis Xavier (1506–1552). They were later joined by Simão Rodriguez (1510–1579), Diego Laínez (1512–1565), Alfonso Salmerón (1515–1585), and Nicolás Bobadilla (1511–1590). On August 15, 1534, on the hill of Montmartre in Paris, the seven companions pronounced the vows that bound them to each other. After their initial idea of leaving for Jerusalem, they promised to make themselves available to the pope and to go wherever he might send them.

In 1539 the companions moved to Rome to discuss the future of their association. To set out the characteristics of the order, they wrote the *Formula vivendi*, the document which, as the “plan of life” of the association, was submitted to the pope's scrutiny. The religious experience originating from the union of the seven companions was officially recognized in 1540 by Paul III with the bull *Regimini Militantis Ecclesiae*. In accordance with the pope's indications, the following year the members of the Society elected Ignatius as superior general. Subsequently, the *Formula vivendi* was adopted. From this commitment the *Constitutions*, which Ignatius wrote in Rome, took shape. Among other things, the *Constitutions* regulated the organization of the Society. It was an order of “clerics regular,” similar to those founded in the Tridentine age, but with a strong vocation for militant action in defense of the Church and the pope.

During the sixteenth century, the Society assumed the structure that characterized it until the suppression (1773) and again after the

restoration (1814). The degrees of Jesuit formation were organized in stages, beginning with 2 years of novitiate, at the end of which the aspiring Jesuits, called scholastics, would pronounce three simple and perpetual vows. Then came 2 years of classical and scientific studies, followed by 3 years of philosophy, at the end of which the scholastic would receive priestly ordination. Next generally came 4 years of theological studies. The formation process concluded with another year of novitiate, called the “third probation,” at the end of which the Jesuit pronounced the three solemn vows of poverty, chastity, and obedience, becoming a professed member of the Society, and the fourth vow of special obedience to the pontiff. Alongside the professed members, there were other figures in the Society: spiritual coadjutors, who pronounced only the three simple vows, and temporal coadjutors, normally employed in temporal tasks.

Education in the Society of Jesus

From the earliest years following their official recognition, alongside missionary activity, the Society distinguished itself for its efforts in the field of education. In the early 1550s, the Jesuits began to open numerous schools. Education as a central activity in the life of the Society was more precisely defined during the course of the sixteenth century. In 1560, Juan Alfonso de Polanco, the secretary of Ignatius, wrote a missive to all the superiors of the Order, in which he discussed the methods necessary to help others. He dealt with the education of the young in letters, in doctrine, and in Christian life as a fundamental ministry that defined Jesuit identity (Casalini 2018).

During the sixteenth century, as a result of the Society’s expansion, the problem of guaranteeing that future members of the Order received an adequate education emerged. The *Formula vivendi* prescribed the establishment of institutions alongside the universities for training members of the Order. The Jesuit colleges took shape from the application of this disposition. These structures, initially dedicated to the formation of clerics, were subsequently opened to young people who did not intend to take vows. The colleges hosted the scholastics who were attending classes

at the university. In 1544 there were seven colleges of this type: Paris, Leuven, Cologne, Padua, Alcalá, Valencia, and Coimbra (Grendler 2017; Mattei and Casalini 2016; Maryks 2012; Brizzi and Greci 2001; Giard 1995).

In response to the requests of the wife of the Viceroy of Sicily, in 1548, Ignatius sent some of the leading Jesuits to Messina in order to establish a college. A group of them, including Jeronimo Nadal and Pietro Canisio, were sent to Messina to teach disciplines such as theology, casuistry, the arts, rhetoric, and grammar. The commitment made by the most influential aristocratic families to the foundation of the college of Messina was aimed at ensuring that their children could receive a high-level education. That this college was open to young people who were not destined to enter the Society of Jesus distinguished it from the educational institutions previously founded by the Society. On the basis of its success in Messina, the dignitaries of the city of Palermo asked Ignatius to establish a college in their city, a request to which he willingly agreed.

In 1551 the Collegio Romano (Roman College) was opened and was later elevated to the rank of a university. The Collegio Romano soon became a model for all the other educational institutions established by the Society. Its success was based on excellent teachers and excellent teaching techniques. Some of the most important Jesuits of the early modern age taught there: Francisco de Toledo from 1559, Juan de Mariana from 1561, and the German mathematician Christopher Clavius from 1564. Important theologians were also active at the Collegio Romano such as Gregorio de Valencia, Francesco Bellarmino, Benet Perera, Francisco Suárez, and Athanasius Kircher (Casalini and Sander 2017; Casalini and Pavur 2016; Sander 2014; Ponzio 2014). Many of these teachers had themselves been among the early students there, including Clavius, Bellarmino, and Perera.

The pedagogical system developed by the Society from its origins and adopted at the Collegio Romano was based on the *modus Parisiensis*, which Ignatius himself had experienced during his time at the Collège de Montaigu in Paris. It provided a detailed program of lessons, culminating in the study of theology, that were

carried out in parallel with the tutorials, repetitions, and discussions in which the students were involved. The importance of the *modus Parisiensis* in the formation of the Jesuit teaching method emerges clearly from the words of Ignatius's secretary, Polanco: speculating on benefits that instituting this pedagogical system in the Collegio Romano could bring, he wrote that "it will be a wonderful help in Italy, where two things are missing especially in schools: a well-ordered program of lessons and exercises to ensure the assimilation of materials. We therefore hope that diligent students will benefit more from a short time with us than in long periods spent elsewhere; and perhaps other schools will improve, inspired by our example."

In 1552, Jeronimo Nadal, dean of the new College of Messina, wrote *De studii generalis dispositione et ordine* (On the Arrangement and Order of the Studium Generale), one of the first scholastic regulations of the Society. The pedagogical system developed within the Society underwent continuous evolution, until a stable program was achieved in 1599 with the publication of the *Ratio studiorum Societatis Iesu* (Rule of Studies of the Society of Jesus) (Gilbert 2014; Bianchini 2014; Forlivesi 2010; Pavur 2005; Nelles 2004; Padberg 2000; Brizzi 1981). This document, alongside the *Constitutions*, represented the Society's regimen of studies.

The didactic organization designed by Ignatius excluded elementary education. It was important to dedicate time to the teaching of the rudiments of literacy, but only those who had a minimum level of preparation could be accepted into the schools of the Society. This first phase of education was called "Lower Grammar" (*Infima Grammatica*) and generally consisted of only 1 year; though, in some cases, it was spread over 2 years. The second and third courses, called "Middle and Upper Grammar" (*Media et Suprema Grammatica*), respectively, completed the first cycle of studies, necessary to provide students with an in-depth knowledge of Latin. The second cycle of studies was called "Humanist Disciplines" (*Humanitas*) and consisted of two classes: poetry and rhetoric. These first two cycles of studies composed the so-called Lower Studies (Codina Mir 1968). Over time, to provide

students with an ever higher standard of education, the Society organized a university-level education system, based primarily on the teaching of theology, philosophy, science, and mathematics (De Aldama 1989).

Despite the prescriptions established in the *Constitutions* and in other documents concerning education, the activities offered in the colleges of the Society were not always uniform. In many cases the Jesuits had to adapt their educational program to contingencies, placing greater emphasis on certain subjects to the detriment of others. During the seventeenth century, for example, many of the Society's schools limited themselves to teaching the so-called Minor Disciplines: 3 years of grammar, a year of poetry and history, and another year of rhetoric. In other cases, as for example in the Collegio Romano, the program included, along with the Minor Disciplines, the teaching of university subjects, the so-called Higher Disciplines, a course of studies that culminated in theology. The Society integrated the *modus Parisiensis* with Aristotelian philosophy, humanist disciplines, and Thomist theology. Before embarking on the course of philosophy, preparatory to the study of theology, students were required to have attended 2 years of rhetoric, the subject at the basis of the humanist disciplines.

During the sixteenth century, in order to implement concretely the intentions developed in the *Ratio studiorum*, the Jesuits began to write manuals and texts for teaching, which were gradually adopted in the colleges of the Society and which remained in fashion until the eighteenth century. Within a few years, the Society's colleges were opened throughout Europe and in the territories where the Jesuits were engaged in missions. On Ignatius's death, in 1556, it administered more than 30 colleges, of which 19 were located in Italy. Following the diffusion of the colleges, the Society needed to define precisely the Jesuits' commitment to the field of education. Since the *Formula vivendi* did not specify anything concerning this aspect of the Society's work, the role of the educational ministry in its life was defined in the *Constitutions*. The *Constitutions* offered the normative framework within which the Society's pedagogical activity was to take

place, regulating the order in which the disciplines were to be taught, the method to be used in teaching them, and the texts which the students were to study. Furthermore, the *Constitutions* expressed two fundamental principles: first, that each educational institution of the Society should finance itself; secondly, that the students of the colleges should study for free. This second principle, however, did not translate into education addressed exclusively to the poor. The Society's colleges maintained a close relationship with the most influential European families, who sought to give their children the high standard of education provided by the Jesuits. This led to the creation of "Schools for Nobles" (*Seminaria nobilem*), institutions dedicated to the formation of young people of the ruling classes.

Philosophy in Jesuit Education

In the educational system based on the *modus Parisiensis*, theology was at the top of the pyramid of the disciplines to be taught, with all other disciplines considered as preparatory to its study. Among the Higher Disciplines taught at university level, philosophy nevertheless occupied a place of great importance (Casalini 2019; Schmutz 2010). As early as 1547, Ignatius had assigned to the Society the task of teaching not only theology but also philosophy, mathematics, and the natural sciences.

At the University of Paris, where Ignatius and his first companions had studied, the philosophy course included the teaching of various disciplines, such as logic, dialectics, physics, astronomy, metaphysics, and ethics. Following the foundation of its first universities, the Society adopted the program of Higher Studies used at the university colleges in Paris.

Just as theology was taught in the light of the doctrine of Thomas Aquinas, the study of philosophy was conducted on the basis of the works of Aristotle (Casalini 2017; Blackwell 1999; Simmons 1999; Lohr 1976). The importance of these two authorities, Thomas and Aristotle, was explicitly stated in the fourth part of the *Constitutions*. The central role of Thomas in Christian theology was sanctioned by the Fifth Lateran Council in 1513 with the bull *Regiminis Apostolici*

and reiterated in 1567 with the bull *Mirabilis Deus*. Assigning the role of *Doctor Ecclesiae* to Thomas was a response to the teaching of the natural philosophy, especially at the University of Padua, inspired by the commentaries of Averroes and based on the separation of reason and faith (Hellyer 2005). By contrast, the Society's choice of Thomas's doctrine was based on the doctrine of the compatibility of reason and revelation, between nature and grace. According to Jesuit theology, which had important repercussions on the theological anthropology developed by the Society since the time of Ignatius, grace was not the only instrument necessary for salvation, but it was also a fundamental means to bring man's nature to fulfillment. In this way, alongside the grace bestowed freely by God, man had to rely on free will, thus taking part in his own salvation. Essential to the philosophical system of the Society was the harmonization of Aristotle's teachings with Christian principles, in particular with Thomist doctrine. The centrality of Thomas in the construction of the theological and philosophical system of the Society did not, however, prevent some Jesuits from taking account of other positions such as Scotism. This "eclectic" attitude led to many criticisms of the Society and accusations against it.

The Collegio Romano, where some of its most important professors taught, was one of the main places where, through numerous and at times very heated debates, a shared philosophical and theological vision took shape over time within the Society (Gilbert 2006; Villoslada 1954). These debates, besides contributing to the construction of a uniform pedagogical system, had a leading role in the formation of the Society's identity, in the fields of both philosophy and theology. In order to standardize the course of studies in its colleges and the method of teaching the various disciplines, in 1599, during Claudio Acquaviva's generalship of the Order, the *Ratio studiorum* was drafted. This document, which formally established the rules regarding the education of Jesuits, was the result of the efforts of numerous academics in the Society and had important consequences for the teaching of philosophy. One aspect that emerges clearly from the *Ratio studiorum*: the study of philosophy was conceived

as preparatory to the study of theology. Nadal summarized this concept, which was then taken up and formalized in the *Ratio studiorum*: “The liberal arts and the natural sciences prepare the intellect for the study of theology and enable the proper understanding of it and its employment, and of themselves tend toward the same end.” The idea that knowledge of philosophy was instrumental to the study of theology influenced the way that the philosophical disciplines were taught within the Society.

Different disciplines were placed under the heading “philosophy,” according to the division proposed by Aristotle: natural sciences, psychology, moral philosophy, and metaphysics. The study of these disciplines was conducted on the basis of the works of Aristotle and the Aristotelian tradition: logic was taught from the *Organon*; natural sciences from the *Physics*, *De caelo*, the *Parva naturalia*, and the *Meteorology*; psychology from *De anima*; and moral philosophy from the *Ethics*. The philosophy course lasted three and a half years. Philosophical subjects were studied one at a time, starting with logic, moving on to natural philosophy, and finishing with metaphysics and psychology. Little space was reserved for moral philosophy, but many topics dealt with in this subject were addressed in subsequent courses in theology.

Innovative and Original Aspects

Aristotle and the Teaching of Metaphysics in the Society of Jesus

In the field of philosophy, the transition from the medieval to the early modern period, via the Renaissance and the rise of humanism, constitutes a moment of discontinuity, of critical recovery, and of redefining concepts developed in the Middle Ages. In philosophy, the authority of Aristotle, which, together with the theology of Thomas, was the foundation on which scholasticism had taken shape and which the Church had assumed as its own theological-philosophical system, was called into question. The translation of Plato’s dialogues into Latin, together with new astronomical discoveries, weakened the grip of Aristotelianism, and consequently of scholasticism, on philosophers.

Despite these developments, the importance of scholasticism as the Church’s theological-philosophical system was confirmed, and Aristotelian teachings continued to play an authoritative role in Catholic theology. The *Metaphysics*, the work that Aristotle composed in his maturity, was still regarded as the best introduction to the study of theology. In this regard, the Dominican Order had a leading part. In Dominican schools, the theology of Thomas was taught in parallel with the philosophy of Aristotle. This teaching strategy was an attempt to counter various currents that had developed, in the first place in the Order of Friars Minor, within scholasticism during the fourteenth and fifteenth centuries, based on the thought of John Duns Scotus and William of Ockham.

The Council of Trent (1545–1563), primarily as a response to the Protestant Reformation, reaffirmed the role of scholasticism as the foundation for the teaching of theology. Yet, while this remained the general framework within which the Catholic Church developed its thinking on the relationship between philosophy and theology, Aristotelian philosophy nevertheless underwent a process of re-elaboration in the Catholic world. The rigid doctrines of Aristotelian philosophy were ill suited to the new currents that emerged in the sixteenth century. It was felt necessary to deal with philosophical themes more freely, even though the place that Aristotle had occupied during the Middle Ages was defended.

In this process, which began in Italy and achieved its most important results in the Iberian peninsula, the Society’s theologians took the lead. Following the Protestant Reformation, some Jesuit theologians undertook a rethinking of the relationship between reason and the supernatural, coming up with new interpretations that led to a reformulation of Aristotelian metaphysics independent of divine revelation. Of great importance for the evolution of the Society’s theological and philosophical thought were the writings of Benet Perera (1535–1610), a professor of Sacred Scripture at the Roman College (Lamanna 2014a, b, 2019; Casalini 2017; Casalini and Pavur 2016; Carvalho 2014; Gilbert 2014; Ventimiglia 2014). Perera, who was also active in the field of natural

philosophy, grasped the spirit with which in 1547 Ignatius had assigned the task of teaching to the Society and engaged in the study of the relationship between philosophy, mathematics, and natural sciences. In a series of works seeking to reconcile Platonic and Aristotelian philosophy, Perera supported the value of philosophical freedom, affirming the primacy of reason to the detriment of the authority of philosophers in the scientific disciplines. This idea, which implied the concept of a twofold truth – of faith and of reason – led to accusations of Averroism from some teachers at the Collegio Romano, such as Achille Gagliardi, a professor of scholastic theology, and Giovanni Pietro Maffei and Benedetto Giustiniani, professors of rhetoric. Diego de Ledesma, who held the chair of “Theological Controversies,” also took a stand against Perera’s philosophical theses (Sander 2014). Gagliardi, criticizing the work of General Évrard Mercurian, who in his opinion had not opposed Perera’s theses, sought support from Gregory XIII. The pope, in order to mend a breach that could have undermined the Society’s unity, decided to condemn Gagliardi, Maffei, and Giustiniani to a month in prison and to suspend them *a divinis* for a year (Sander 2014; Blum 2012: 141–147; Henrici 2006).

In his treatise *De communibus omnium rerum naturalium principijs et affectionibus* (On the Common Principles and Properties of All Natural Things), published in 1576, Perera also promoted the idea that experience is the essential basis of philosophical investigation. He argued that, unlike natural philosophy, mathematics and geometry cannot be considered perfect sciences, as they do not concern the causes that determine the nature of things. Natural philosophy, the perfect science by definition, uses mathematics and geometry only for the purpose of explaining the data of experience. For these reasons, Perera’s work was cited and appreciated by Galileo.

Alongside Perera stands the figure of the Portuguese Jesuit Pedro de Fonseca (1528–1599) (Martins 2019; Dvorák 2009; Martins 1994). From 1571 until his death, Fonseca worked on his *In libros Metaphysicorum*, one of the first modern commentaries on Aristotle’s *Metaphysics*. The

method adopted by Fonseca in his commentary represented an innovation in the panorama of studies on Aristotelian philosophy. The commentary was placed next to the original Greek text and was flanked by the Latin translation and references to the main texts of the ancient and medieval tradition. Obeying an assignment received from the Superior General Acquaviva, in the early 1590s, Fonseca began the collection entitled *Commentarii Collegii Conimbricensis* (Commentaries of the College of Coimbra), also known as the *Conimbricenses*. This work, to which many professors of the College of Coimbra made contributions, had a remarkable diffusion over many editions and was adopted as the main manual of philosophy in the colleges of the Society. Between 1592 and 1606 five volumes in the series of *Commentarii* were published, including commentaries on the *Physics*, *Ethics*, *De anima*, and the writings on logic and natural philosophy of Aristotle. In 1668, taking up the tradition inaugurated by Fonseca in his commentary on Aristotle’s *Metaphysics*, Silvestro Mauro, a professor at the Collegio Romano, published his *Aristotelis Opera omnia* (Aristotle’s Complete Works), a commentary on all the works of Aristotle, with Greek text and Latin translation.

A fundamental role in the development of the Second Scholastic was played by the theologian Francisco Suárez (1548–1617), a professor at the Collegio Romano and later at the universities of Coimbra, Salamanca, and Alcalá (Hill 2019; Maryks and Senet de Frutos 2019; Fink 2015; Darge 2014; Gordley 2012; Heider 2007). After devoting himself to studying and commenting on Thomas Aquinas’s *Summa theologiae*, Suárez undertook the revitalization of the scholastic tradition by adapting its language to the context of the Spanish Counter-Reformation.

Later, Suárez concentrated on metaphysics, in order to offer theology students a necessary manual for their education. In 1594 his *Disputationes metaphysicae* (Metaphysical Disputations) were published, a significant innovation in the panorama of philosophical studies. Suárez’s teachings, departing from a tradition which had developed in the Middle Ages, was not a simple commentary on Aristotle’s metaphysics but instead a systematic treatise on being, God, and creatures in

general, based on a critical analysis of numerous ancient and contemporary authors. The *Disputationes*, which became a fundamental text on metaphysics, adopted in many courses of philosophy in the seventeenth and eighteenth centuries, was divided into two parts. The first, in which Suárez writes of being as such, its properties, and its causes, and the second, dedicated to the study of particular beings, for example the infinite entity, God, and finite beings, creatures. Going beyond Thomist thinking based on the analogy of being – the idea that being in general and God coincide – Suárez supported the uniqueness of being. Being is unique and incorporates in itself many beings, even including God, the infinite being but still less than being in general (Ashworth 2008).

The impact of Suárez's teachings on seventeenth-century philosophy was remarkable. His thought was so influential that it gave rise to a philosophical current called "Suarezismus," which found its *raison d'être* in the melding of scholastic doctrine and empirical investigation, with particular attention to problems arising in late sixteenth-century society. During the seventeenth century the teachings of Suárez became the foundation for philosophical studies in the Society's colleges. The study of philosophy by means of the systematic method was the basis of the work of various Jesuit philosophers, such as the Spaniard Gabriel Vázquez (1549–1604), the author of the *Disputationes metaphysicae*, published posthumously in 1618, and Pedro Hurtado de Mendoza, a professor of Pamplona, who published his *Disputationes de universa philosophia* (Disputations on Universal Philosophy) in 1632 (Caruso 1979). The *Summa totius philosophiae* (Summary of All Philosophy) and *Divi Thomae doctrina* (The Doctrine of St. Thomas), published from 1618 to 1623, philosophy courses based on the lectures held at the College of Brera in Milan by Cosimo Alamanni (1559–1634), became celebrated.

In the second half of the seventeenth century, the scholastic model, grounded in the authority of Aristotle and Thomas, on which the Society had built its philosophical and theological system, entered a period of crisis. Among the multiple

factors that brought about this situation were the intellectual debates at the turn of the seventeenth century featuring rationalist ideas, empirical philosophies, astronomical discoveries, and especially Cartesian thought, which highlighted the insufficiency of scholasticism as a means of understanding reality. Some Jesuits proved open to dialogue with the new seventeenth-century philosophical ideas, committing themselves to a critical re-interpretation of the traditional foundations of scholasticism in the light of the ideas of René Descartes, Nicolas de Malebranche, Pierre Gassendi, John Locke, and Gottfried Wilhelm von Leibniz. This attitude, which affected numerous colleges of the Society, especially in France, generated criticism from the superiors of the Order, because openness to Cartesian philosophical ideas might cast doubt on the scholastic model, on which the Society had constructed its theological and philosophical teachings.

In order to remedy this situation, in 1651 Francesco Piccolomini, the Society's Superior General, prohibited the teaching of 65 philosophical propositions. The Superior General Michelangelo Tamburini did likewise in 1706, prohibiting 30 propositions from the texts of Descartes, Malebranche, Locke, and Leibniz. Despite the position taken by the superior generals of the Society, some Jesuits were committed to demonstrating the compatibility between the principles of scholastic doctrine and seventeenth-century scientific discoveries. Honoré Fabri, a professor in Lyon, was a spokesman for this position, while distancing himself, in his *Philosophia universa* (Universal Philosophy), of 1646, from Cartesian thought. The same line of reasoning was taken up by Giovanni Battista Tolomei, the author of *Philosophia mentis et sensuum* (Philosophy of the Mind and of the Senses), published in 1696.

The Relationship Between Grace and Free Will: Jesuit Theological Anthropology

To counter the idea of predestination formulated by Protestant theologians during the sixteenth century, the gathering of churchmen in the Council of Trent affirmed that the sin of Adam, although transmitted to all mankind, did not entail the extinction of free will, but only its weakening.

Human nature, therefore, was wounded but not irremediably corrupted by original sin. On the basis of the decrees formulated by the Council of Trent and the doctrine of Thomas Aquinas, in the second half of the sixteenth century, the Spanish Jesuit Luis de Molina (1535–1600) supported the idea that grace confirms, rather than eliminates, humankind's freedom. According to Molina, God knows from eternity those who are damned and those who are saved not by predestination but by his prediction of human merits or demerits. In 1584 Molina retired to Lisbon, where he composed some of his most important works. Among these was his *Concordia liberi arbitrii cum gratie donis* (The Concord of Free Will and the Gifts of Grace), published in 1588, in which he argued that, although human freedom cannot be regarded as free in itself, divine grace nevertheless does not pre-determine human actions, because they are based on free will. Molina's ideas, from which the current of thought called "Molinism" was born, generated an important debate in the Society on theological anthropology (Aichele 2013, 2019; Brett 2014; Cruz 2014; Perszyk 2013; Costello 1974).

Francisco de Toledo (1532–1596), a professor of metaphysics and scholastic theology at the Collegio Romano, developed his thought along the same lines as Molina (Tropia 2019; Dvorák 2009). Writing on the theme of predestination, which became central to theological reflection following the Protestant Reformation, Toledo supported the theory of predestination *post praevisa merita*, which was founded on the idea that God gives effective grace and perseverance to those whom he recognizes as capable of responding positively to it. This theory was initially criticized by the other professors at the Collegio Romano, because it was considered a novelty with respect to the traditional doctrine. Over time, however, the theory of predestination developed by Toledo was widely accepted in the Society.

The theological anthropology elaborated by Molina not only attracted criticism from within the Society. Outside it as well, Molina's theories provoked intense debates. The primary critics of his teachings were Dominican theologians, such

as Domingo Bañez (1528–1604), a professor at the University of Salamanca. Dominican theologians accused Molina and the Jesuit theologians in general of proclaiming a sort of "Pelagianism," aimed at extolling man's free will to the detriment of the role of divine grace in salvation. In turn, the Jesuits accused the Dominican theologians, who, in their opinion, tended to attribute excessive importance to divine prescience and thus to eliminate the role of human merit, of "Calvinism."

Francisco Suárez participated in this dispute and promoted an intermediate and conciliatory position between the opposing sides. In 1599, he published some *Opuscula theologica*, in which he developed his theological anthropology. The two most important points of Suárez's thought were, firstly, that divine predestination does not annul free will, and, secondly, that divine grace is not distributed according to the prediction of human merits, as some Jesuits, including Molina, thought, but instead prior to it. This second assumption guaranteed the completely free and equal character of the divine act of distribution of grace. Of particular importance among his *Opuscula theologica* is the treatise *De concursu et efficaci auxilio Dei ad actus liberi arbitrii necessario* (On the Necessary Combination and Efficacious Help of God with the Act of Free Will), in which Suárez argued that human will has in itself the power necessary for its own determination. In other words, the intervention of divine grace is essential for the good use of free will, but at the same time, it is necessary for human will to accept grace and put it to good use. In this way, the position supported by the theologians close to the Molina and the opposing position supported by the Dominicans were reconciled by Suárez through teachings that were to leave a profound impression on the anthropological vision of the Society. The divine action of giving grace, an action which cannot be understood by humans because their nature is limited, attains its fullest meaning in the light of human freedom. Moreover, free will is necessary to understand that, in the absence of supernatural intervention, humans cannot achieve salvation (Esposito 2014; Courtine 1990; Giacon 1944). It was on the basis of this position that the distinction between "sufficient" and "effective" grace took shape: sufficient grace,

once given to a human being, makes freedom of will potentially active; effective grace allows freedom of will to fulfill itself effectively.

A leading role in the dispute concerning the relationship between grace and free will was played by Roberto Bellarmino (1542–1621), a professor at the Collegio Romano. Bellarmino, trying to mediate between the two opposing positions, did not propose to resolve the dispute through a doctrinal definition, but rather sought to promote the dispute for constructive purposes, leaving the debate open to different currents of thought. This orientation aimed to avoid mutual condemnations which could have weakened Catholic thought to the advantage of Protestant denominations. For Bellarmino, from the doctrinal point of view, accepting one of the two positions would have resulted in the condemnation of the opposing position, provoking a clear and incurable fracture between grace and free will. Drawing on the courses on “Theological Controversies” that he held at the Collegio Romano between 1586 and 1593, Bellarmino published *Disputazioni sulle controversie della fede cristiana con gli eretici del nostro tempo* (Disputations on the Controversies of the Christian Faith with the Heretics of Our Time), in which he gave systematic form to his proposal for mediating between the controversies that had arisen in the Catholic world.

To calm down a dispute that could have caused an irredeemable rupture within Catholicism, in 1602 Clement VIII established the *Congregazione de auxiliis divinae gratiae* (Congregation on the Help of Divine Grace), initially composed of eight theologians, predominantly Dominicans. The congregation decided to condemn 60 theses extracted from the Molina’s *Concordia liberi arbitrii cum gratie donis*, which were reduced to 20 following the entry of two Jesuit theologians into the congregation. In 1607 Paul V ordered the dissolution of the congregation and officially stated that there were no heretical propositions in Molina’s treatise. This pronouncement, which exonerated Molina’s teachings from the accusation of heresy, left open the dispute between the two opposing sides: those who exalted the role of grace and those who also wanted to value the role of human free will in salvation.

The lack of a definitive pronouncement by the Roman Church on the dispute *De auxiliis* meant that during the seventeenth century, the theme of the relationship between grace and free will again split Catholic thought. Controversies concerning predestination returned to the center of the Catholic theological-doctrinal debate on the basis of the ideas supported by the theologian Michel De Bay, a professor at the University of Leuven, who exalted the role of divine grace to the detriment of human free will in salvation.

Equally important was the Synod of Dordrecht, convened by the Dutch Reformed Church in 1618 in order to heal the fracture produced within the Dutch church following the ideas advocated by the Remonstrants, who, basing themselves on the teachings of Jacob Arminius, affirmed, in opposition to the traditional Calvinist doctrine, that human beings are able to resist grace and that divine election was founded on the divine prediction of human merit. The Synod of Dordrecht ended in 1619 with the rejection of the Remonstrants’ thesis, reestablishing traditional Calvinist doctrine.

Even more significant for the discussion of the relationship between grace and free will was the publication in 1640 of the treatise *Augustinus*, composed by the bishop of Ypres, Cornelis Jansen (1585–1638), and published 2 years after his death. Trained at the University of Leuven, Jansen, in his *Augustinus*, relying on the doctrine of Augustine, affirmed that Christ had not died for all of humanity and that, therefore, divine grace was not given to all humankind, but only to a part of them, who were saved independently of the divine prediction of their merits. The publication of Jansen’s treatise, which was an immediate success, widened the controversy that had opened following the publication of Molina’s writings in the late sixteenth century. Jesuit theologians, advocating the thesis that free will is fundamental to salvation, were at the forefront of the opposition to the Jansenist doctrine, giving rise to a controversy which, despite repeated condemnations of Jansenism by the Church of Rome, left a profound mark on the identity of European Catholicism throughout the seventeenth and eighteenth centuries.

The theological anthropology elaborated in the Society of Jesus also had important consequences on Jesuit moral theology, a field of study that, between the sixteenth and seventeenth century, became a subject in itself. Starting from the idea that human nature is not irreparably corrupted by original sin, the Jesuits developed an optimistic attitude towards the life of man in society. This orientation in the field of morality, called “probabilism” (Maryks 2008; Schmitz 1990), together with the development of the “casuistry”, that is, the study of the single cases that challenged the conscience of the faithful, was strongly criticized by the rigorist and Jansenist currents (Ginzburg and Biasori 2018; Quantin 2001). The role of the Jesuits in the development of probabilism and “casuistry” was decisive. For example, the *Ratio studiorum* foresaw the teaching of cases of conscience, and in 1600, Giovanni Azor (1535–1603), professor of the Roman College, inaugurated the literary genre of “Moral Institutions,” which provided priests with information about the practice of confession. Some Jesuits distinguished themselves in the field of moral theology, such as Suárez, Gabriel Vasquez (1549–1604) and Antonio Escobar y Mendoza (1589–1669).

Natural Law, Positive Law: The Relationship Between the Church and Temporal Power

In the field of natural law and positive law, important innovations occurred during the period of humanism and the Renaissance. The discovery of the New World, which revealed the existence of previously unknown populations, and the formation of nation states in a manner that was increasingly independent of the power of the Church of Rome, stirred up a vigorous debate concerning the nature of human beings and their rights, on the one hand, and the nature of sovereign power and the relationship between church and state, on the other. In this context, the scholastic theological-philosophical system began to be regarded as inadequate for understanding a rapidly changing reality. Some intellectuals began to rethink traditional ideas according to new perspectives that were better suited to the analysis of the social, political, and economic

developments that affected the world during the sixteenth century. Among these intellectuals, the Spanish Jesuits, together with the Dominicans, played a leading role (Nelson 2005; Höpfl 2004).

Based on the teachings of Francisco de Vitoria, a Dominican professor at the University of Salamanca, Suárez made a significant contribution to the study of natural law (Coujou 2015; Courtine 1999; Ferraro 1990). In 1612, he published *De legibus* (On the Laws), a systematic treatise on moral philosophy and law, in which, referring to the doctrine of Thomas Aquinas, he reflected on the nature and significance of law in the formation of civil society. There are two types of law according to Suárez. On the one hand, there is natural law, which is inherent in every human being and which is capable of acting on free will to accomplish good; this law constitutes the reflection of divine law in humankind. On the other hand, there is positive law, which is promulgated by a body possessing legislative power and which, therefore, is not inherent to humankind, but is instead imposed by God or by human beings. Once again, referring to what de Vitoria had said about the law of nations, Suárez maintained that the *ius gentium* (law of nations) belongs to the category of positive law but has a character of universality that brings it closer to natural law. For Suárez, law would make no sense without the Thomist concept of the hierarchy of laws.

Suárez's views on natural and positive law had immediate consequences for the idea of the nature of the state and the formation of political society. Adopting a Thomist perspective, he regarded human beings as social animals, who therefore naturally aspire to live in contact with other humans. In order for civil society to be balanced and orderly, the presence of a sovereign authority, which derives its mandate and its legitimacy directly from God, is indispensable. It is God who recognizes the authority of the community as an organic body. Subsequently, power is transferred completely and irrevocably from the community to the prince, intended as an instrument delegated to the political command of society. According to Suárez's thesis, legislative activity is the responsibility of the legitimate authority and

must conform to natural law. If this does not happen, the community, while not being able to resort to tyrannicide, is entitled to use force for defensive purposes, so as to impose respect for natural law on authority. The relationship between Christian authority and constituted authority was an issue of considerable importance in the debates that arose in the modern age within the Society.

The position of Juan de Mariana (1563–1624), professor of exegesis at the Collegio Romano from 1561 and later of theology in Paris, was important in this regard. In 1599 Mariana published *De rege et regis institutione* (On the King and the Education of the King), in which he supported the legitimacy of tyrannicide in cases where the prince does not respect religion and the common good. Mariana's writing generated a powerful debate both within and without the Society. In the face of the many criticisms which Mariana's views received, General Claudio Acquaviva condemned his treatise (Braun 2007).

The relationship between natural law and positive law also had important implications as regards the relationship between temporal authority and ecclesiastical power. Once again, Suárez's views, in *De legibus*, in particular, and those of the theologians of the Second Scholastic, in general, played a leading role. Suárez recognized the separation between spiritual authority, which belongs to ecclesiastical powers, and political authority, which pertains to secular powers. Moreover, while denying the right to wage war for territorial expansion, he supported, on the basis of Thomas Aquinas's writings, the right to wage a just war where necessary to repair violations of the law of nations. In theory there is no need for an authority to proclaim this right because it is inherent in the *ius gentium*. In order for a defensive war to be considered legitimate, however, it must be declared by a constituted and legitimate authority.

Debate within the Society on natural and positive law assumed a particular relevance following the discovery of the New World (Catto et al. 2010; Clossey 2008; Broggio 2004). These geographical discoveries led to a dispute between jurists, theologians, and missionaries concerning the natural rights of the indigenous peoples of America. At first, it was asked whether these populations

had the right of individual liberty, whether they were entitled to possess the land on which they were born, and whether the king of Spain had direct dominion over them. These questions led to the dispute of Valladolid, held between 1550 and 1551, in which the central question concerned the right of the Spanish king to wage war against the American Indians before their conversion. The Jesuits made a very important contribution to this controversy, in which the foundations of modern international law were laid and which involved some of the best-known jurists and theologians active in the second half of the sixteenth century. Because of their missionary commitment, which brought them into direct contact with the indigenous peoples of Central America, members of the Society, as well as the Dominicans, began to reflect on the problems arising from the geographical discoveries. Some Jesuits, at least in the initial phase of colonization and evangelization of the Americas, were in favor of the conversion of the Indians by means of coercion. Others, however, openly criticized this method and engaged in the gradual conversion of indigenous peoples. For example, there were Jesuits who devoted themselves to the study of the history of the Incas in order to find possible links between indigenous devotional practices and the Christian religion.

The figure of José de Acosta (1540–1600), a Jesuit active in missions in Peru and Mexico, is particularly important in this regard. In 1571 Acosta published *De procuranda indorum salute* (On Providing Salvation for the Indians), in which, defending Native Americans on the basis of a natural right inherent in human beings, he criticized those who claimed that they could not achieve eternal salvation. In 1589, he reiterated these ideas in *Historia natural y moral de las Indias* (Natural and Moral History of the Indies). Acosta himself, however, acting as the spokesman for a view shared by many Jesuits, opposed the ordination of Jesuits of cross-bred parentage, supporting this position on the grounds that the religious and civil rights of Native Americans were idolatrous. This stance was criticized by Blas Valera (1546–1596), a Jesuit born to a Peruvian mother and a Spanish father (Mattei and Casalini 2013), who entered the Society in 1568 and in 1573 was

ordained a priest in the diocese of Lima. A number of works on grammar, history, and anthropology are attributed to him; however, whether or not he wrote them has been called into question. Nevertheless, the treatise *De las costumbres antiguas de los naturales del Pirú* (On the Ancient Customs of the Indigenous Peoples of Peru), published in the 1690s, is certainly his.

Other Jesuits active in the Americas, such as Miguel Fuentes and Luis Lopez, openly censured the violence perpetrated by the Spanish against the indigenous peoples and criticized the idea of their forced evangelization. The criticism by Acosta and Valera of the brutal treatment of Native Americans by the Spanish conquistadors and the defense of the rights of the Peruvian natives resulted in strong tensions between the Spanish crown and the Society. In an effort not to exacerbate an already very tense climate, made even worse by accusations of intimate relations between Valera and an Inca woman, General Claudio Acquaviva recalled the Jesuits active in Peru to Europe. The case of the mission in Peru is emblematic of the complex context in which, even after the intervention of the political authority, discussions on the nature and rights of indigenous peoples took place within the Society.

Science and Philosophy

The Society promoted the study of mathematics in the educational syllabus of its colleges. Like philosophy, mathematics, even though it was the basis of every applied science, including physics and cosmology, was considered instrumental to the study of theology. From the seventeenth century onwards, however, with the coming of the scientific age, mathematics, in particular, and science, in general, assumed an increasingly important role within the Society (Feingold 2003; O'Malley et al. 1999; Baldini 1992).

The study of science in the Society was constructed on a theological-metaphysical foundation. The fusion of the philosophical-doctrinal premises of an Aristotelian-Thomist approach with science and, especially, mathematics determined the distinctive scientific journey on which the Jesuits embarked. This fusion was not, however, without conflict: some traditional

assumptions were abandoned or at least revised in the study of different fields of science, for example, optics, magnetology and cosmology.

The Collegio Romano was home to some of the most important Jesuit scientists, and, among these, Christoph Clavius (1538–1612) occupied a prominent place. After studying at the Jesuit College of Coimbra, he moved to the Collegio Romano to study theology. There he continued the studies of mathematics and astronomy he had begun in Coimbra and taught these disciplines at the Collegio from 1564 until the end of his life. Clavius's commitment to the reform of the Julian calendar was particularly important. In order to avoid the continuous slippage of the dates of the equinoxes, in 1579 he was commissioned to chair a panel of mathematicians deputed to reform the Julian calendar in use since 46 BCE. The reforms were implemented starting from 1582, during the pontificate of Gregory XIII; hence, the name "Gregorian" by which the new calendar is known. Clavius also distinguished himself in the teaching of mathematics. In 1574, he published a commentary on the *Elements* of Euclid, and in 1608, he composed his *Algebra*. These texts were widely read and were used as study manuals by successive generations of students.

The Society's interest in science grew noticeably during the seventeenth and eighteenth centuries, when the study of experimental philosophy allowed room for comparison with the scientific discoveries of Galileo Galilei, Robert Boyle, and Isaac Newton. Of considerable importance for the evolution of scientific thought in the Society was the encounter with the theories of Galileo. During his Pisan period, the young Galileo had close relations with some important members of the Society, above all Clavius, whom he met following his visit to Rome in 1587. Public recognition of his scientific and mathematical skills brought Galileo closer to the academic circle of the Collegio Romano, where increasing tensions between the natural philosophy of Aristotle and the new scientific discoveries were beginning to be felt. Relations between Galileo and the Society were facilitated by the freedom of research existing within the Collegio Romano, which, although within the limits imposed by the Jesuit

discipline, made it one of the main centers of scientific debate in the late sixteenth century.

Historians of science have long debated the sources used by Galileo for the construction of his scientific and astronomical system. Some studies have highlighted the continuity between Galilean thinking and the doctrines of certain members of the Society, especially those who taught at the Collegio Romano, while others have questioned this thesis, arguing for the need to interpret the role of Jesuit sources in the evolution of Galileo's thought with greater caution (Dollo 2003a; Feldhay 1995; Wallace 1984).

Following the publication in 1576 of Perera's *De communibus omnium rerum naturalium principijs et affectionibus*, the cosmological theories developed in the Collegio Romano underwent a rapid evolution in response to Galileo's theses. Despite the diversity of views and opinions that characterized scientific research in the Society, the common denominator of Jesuit cosmology was geocentrism. The theory of geocentrism was defended in the Jesuit world for several reasons. Some members of the Society supported it for theological reasons, basing their arguments on the historical value of the Holy Scriptures: for example, Emmanuel de Sa, who defended the literal meaning of the Bible in his *Notationes in Totam Scripturam Sacram* (Annotations on All of Sacred Scripture); Mariana, who dedicated his *Scholia in Vetus et Novum Testamentum* (Scholia on the Old and New Testament) of 1619 to Bellarmino; Perera, whose *Commentaria et disputationes in Genesim* (Commentary and Disputations on Genesis) casts an interesting light on the exegetical practices of the Collegio Romano; and Jean de Lorin (1559–1634). Other Jesuits supported the geocentric theory for physical reasons, including Muzio Vitelleschi (1563–1645), in his unpublished *In libros De coelo disputationes* (Disputations on *De caelo*) (Dollo 2003b), and Gerolamo Piccolomini, in his *Quaestio tertia de accidentibus coeli* (Third Question on the Accidents of the Heavens) (Dollo 2003b). Still others, such as Clavius, criticized the theory of Copernican heliocentrism, drawing on mathematical, as well as physical and scriptural, arguments.

The publication in 1610 of Galileo's *Sidereus nuncius* (Starry Messenger), containing the astronomical research that he carried out with a telescope, sparked a debate over his revolutionary theses. To demonstrate his esteem for the Collegio Romano as a prestigious seat of learning, Galileo decided to present his scientific discoveries there. He was ceremoniously greeted by Paul V and by the highest prelates of the Roman curia; and he was also granted membership of the Accademia dei Lincei. The importance, however, of Galileo's scientific innovations, first of all the satellites of Jupiter and the theory of heliocentrism, and the awareness of the consequences that such theories could have on the traditional Catholic theological-philosophical system, began to generate suspicions in the Roman ecclesiastical environment, as well as within the Collegio Romano. Bellarmino commissioned mathematicians to prepare a report on the scientific discoveries of Galileo. Clavius, using a telescope, verified the accuracy of Galileo's observations, which he realized were in conflict with the Aristotelian-Ptolemaic theory that he had accepted throughout his life. On the basis of these findings, in the last edition of his *In Sphaeram Ioannis de Sacro Bosco commentarius* (Commentary on John of Sacrobosco's *De sphaera*), Clavius opened up a dialogue between the Ptolemaic theory and the astronomical innovations brought about by Galileo's research.

The debate around Galileo's theories became even more acute in 1612, following the publication of his *Discorso intorno alle cose che stanno in su l'acqua, o che in quella si muovono* (Discourse on Bodies that Float on Water or that Move in It). In this work, Galileo touched on the theme of sunspots. Contrary to the theories of the Jesuit Christoph Scheiner (1573–1650), who claimed that the sunspots were made up of swarms of stars rotating around the sun, Galileo demonstrated that these solar formations were generated by the movement of fluid matter on the surface of the sun caused by its rotation. This thesis was a further demonstration of the heliocentric theory. This theory obviously contradicted the account in Genesis; but, for Galileo, who followed the principle of separation between philosophy and

science, metaphorical expressions were used in the Bible for topics unrelated to salvation. This principle involved a clear distinction between, on the one hand, salvation, which was the concern of theologians, and, on the other, experience and science, which was dealt with by scientists. Following accusations from ecclesiastical circles, the pope decided to entrust the examination of the case of Galileo to the Congregation of the Holy Office. On the basis of an opinion given by Bellarmino, the pope resorted to a private warning, which would preserve Galileo's good name (Baldini 1984).

After a long silence, Galileo, following the ascent to the papal throne of Urban VIII, who was a supporter of his, published *Dialogo sopra i due massimi sistemi del mondo, tolemaico e copernicano* (Dialogue on the Two Great Systems of the World, the Ptolemaic and the Copernican). On the basis of Copernicus's discoveries, Galileo reaffirmed his thesis concerning the motion of the earth. After the publication of the *Dialogo* in Florence in 1632, Galileo was summoned to Rome in 1633 and, on June 22, 1633, he was charged with suspicion of heresy on account of his presentation of the Copernican system.

The tendency to favor a dialogue between the Aristotelian-Thomist system and the new scientific discoveries suffered a setback following the ecclesiastical censorship of the Copernican system. Yet, over time, Copernicanism gained more and more approval, even among some members of the Society. This was the case of Jacob Zallinger (1735–1813), a professor at Munich, who supported the conformity between the Scriptures and the cosmological system as developed by Copernicus. Another Jesuit, Berthold Hauser (1713–1762), in his *Elementa philosophiae ad rationis et experientiae ductum conscripta atque usibus scholasticis accomodata* (Elements of Philosophy Written according to Reason and Experience and Accommodated to the Use of Students), published between 1755 and 1764, while grounding his work in the scholastic system, still emphasized the value of new scientific discoveries, commented on in the language of mathematics.

In 1731, during the 16th General Congregation of the Society, the importance of science and

mathematics in the Jesuit colleges was reiterated. It was nevertheless decided that the scholastic system should remain the model on which all mathematical and scientific analysis was based. This decision led to the condemnation in 1732, by the Superior General Franz Retz (1673–1750), of all propositions contrary to hylomorphism. The orientation of the highest levels of the Society during the eighteenth century hindered the full expression of the scientific potential of Jesuit colleges. This did not, however, prevent the development of highly original positions within the Society during the second half of the eighteenth century. The most important figure in this period was Rudjer Josip Bošković (1711–1787), a professor at the Roman College and later at the University of Pavia. Bošković was the author of *Philosophiae naturalis theoria redacta in unicam legem virium in natura existentem* (Theory of the Philosophy of Nature Reduced to One Law of Powers Existing in Nature), published in 1758, in which he supported an original physical-mathematical interpretation of the naturalness of matter, which he called “dynamism.” His theory of dynamism, which included among other ideas that of the immateriality of the soul originated directly by God, enjoyed great success both inside and outside the Society.

Impact and Legacy

The Evolution of the Society of Jesus in the Seventeenth and the Eighteenth Centuries. Expulsions and Suppression

The influence exerted by the Society in the fields of education, theology, and philosophy began to be questioned in the early eighteenth century. In spite of the originality of the philosophical ideas of some Jesuits, in general the Society was unable to establish a dialogue with eighteenth-century developments in philosophy and political thought. The Society's lack of openness to philosophical innovations led it to condemn the Enlightenment as a whole, without grasping the substantial differences existing within this intellectual current. It was this recalcitrant attitude which was at the root of the conflict that began in the early eighteenth

century between the Society, public opinion, and some representatives of the main European monarchies, placing the privileged relationship that the Society had established with the pope since its foundation in peril.

There were differing reasons for the widespread hostility towards the Society. Alongside the controversies provoked by the Jesuit reductions, or settlements for indigenous peoples, in South America, the question of Chinese and Malabar rites (Mungello 2016), the Society's theological-doctrinal and political battles with Jansenism and Gallicanism, and its opposition to every idea associated with the Enlightenment, were troubles that had been brewing within the Order itself. During the seventeenth century, there had been heated discussions about the correct attitude to be assumed toward the Society's ministries. One faction, which defended the missionary and apostolic vocation of the Society, was opposed to another faction of "zealots," which supported the need for a more contemplative style. Under the generalship of Claudio Acquaviva (1581–1615) and then of Muzio Vitelleschi (1615–1645), the party favorable to the missionary and apostolic model prevailed. This helped place at the center of the Jesuit life that same activism which, during the eighteenth century, led many to criticize the Society. The debate over the Society's system of government was added to another concerning its nature. The increasingly strong centralization and the promulgation of stricter rules for the recruitment of candidates, in addition to a very difficult economic and financial situation, caused a decrease in the number of Jesuits, after constant growth for almost a century. Other difficulties for the Society arose regarding the vow of poverty. The discrepancy between the austerity required of the members of the Order, the great wealth administered by the Society, and the bond that many Jesuits had with the main European courts contributed to criticism from the public. Paradoxically, the field in which the Society had achieved its greatest success, education, also attracted the strongest criticism of the Order. The great diffusion of Jesuit colleges throughout the world and the fact that students studied for free were the most evident

signs of the Society's wealth, which was perceived from the outside as in conflict with the vow of poverty professed by its members.

The tension that arose from the mid-seventeenth century between the Society and public opinion in Europe reached its highest level in France. Here, by the end of the sixteenth century, the Jesuits had served as advisors to the king, and the colleges of the Society were the place where most of the national élites were formed, in the fields of both culture and politics. For example, Molière, Voltaire, Diderot, and Robespierre attended the Louis-le-Grand College, and Descartes studied in the college of La Flèche. Jesuits were involved in the dispute between the Louis XIV and the Church of Rome concerning the powers of the pope and the rights and freedoms of the French Church. The confrontation between the king of France and the Roman Church, which had arisen in the fourteenth century at the time of the schism of Avignon (1378–1417) and had worsened with the publication of the Pragmatic Sanction of Burges of 1438, was only partially resolved by the Concordat of Bologna between Francis I and Leo X in 1516. In 1682, Jacques-Benigne Bossuet, tutor of the Dauphin of France, published the *Four Gallican Articles*. According to this document, which is the basis of Gallican ecclesiology, secular power was independent in temporal affairs and had the full right to exercise its control over ecclesiastical matters concerning the national church. Moreover, it was affirmed that the authority of the ecumenical council was superior to that of the pope. Faced with the strong conflict between the king of France and the pope, the French Jesuits tried to maintain a position of impartiality. Precisely this attitude, oscillating between fidelity to the French crown and obedience to the pope, provoked attacks on the Society, primarily from Enlightenment thinkers. Intellectual problems were added to these political issues. The Society in France was criticized because of its inability to change with the times and to renew its system of philosophical and theological thought. In the first place, the effectiveness of the *Ratio studiorum* was questioned more than two centuries after its composition. Criticisms of the document on

which the Society's educational system was founded focused on two main issues: the centrality of the Greek and Latin classics and, consequently, the use of the Latin language; and Aristotelianism, a philosophical system that was considered obsolete after the scientific discoveries of Galileo and Newton.

In order to respond to these criticisms, during the 17th General Congregation of 1751, the Society reaffirmed the centrality of Aristotle's authority in the teaching of metaphysics, logic, and physics. The problems in the relations between the Society, public opinion, and the main European monarchies reached their peak during the generalship of Lorenzo Ricci (1758–1773), the seventeenth superior general of the Society. In 1759, the Society was expelled from Portugal, in 1762 from France, in 1767 from Spain, in 1768 from Malta and from the Kingdom of the Two Sicilies, and in 1769 from Parma. These measures taken by European courts were followed by the suppression of the Society, decreed on July 21, 1773 by Clement XIV with the publication of the brief *Dominus ac Redemptor*. At that time, the Society had 49 provinces, divided into 6 assistances, 61 novitiates, 669 colleges, 24 professed houses, 340 residences, 171 seminaries, 1542 churches, 271 missions, and about 24,000 members. In Prussia and Russia, Clement XIV's brief of suppression was not implemented, so the Society was able to survive. Only in 1814, with the bull *Sollicitudo omnium ecclesiarum* issued by Pius VII, was the Society reestablished.

Jewish Averroism in the Renaissance

Shalom Sadik

Ben Gurion University of the Negev, Be'er
Scheva, Israel

Abstract

Jewish Averroism (see Renan 1925; Hayoun 1991) was a trend that played an important role in Jewish philosophy from the end of the thirteenth to the end of the fifteenth century. This school of thought flourished primarily in Spain, Provence, and Italy and counted among its adherents many important rabbis, such as Isaac Albalag, Isaac Pulgar, Joseph Ibn Kaspi, Levi ben Avraham, Nissim of Marseille, Moses of Narbonne, and Elia del Medigo. These rabbi-philosophers wrote essentially philosophical (or theological – the distinction does not exist in Jewish philosophy) books and supercommentaries on Averroes' commentaries on Aristotle. They also wrote Bible commentaries as well as books that explain the art of biblical exegesis, though none wrote books on Jewish Law (*Halacha*).

Perhaps the most striking feature of Jewish Averroism is its radicalism. This trend in Jewish thought advanced an extreme philosophical and naturalist interpretation of Judaism and its canonical texts. The radicalism of Jewish Averroism can be seen, for example, in its being the only medieval movement in Jewish thought to completely deny the existence of any kind of life after death. One of the movement's qualities that evinces its radicalism is the willingness of its proponents to expose their radical opinions in a much more explicit and hence comprehensible way than, say, a Maimonides. Interestingly, it was this very openness that allowed the Jewish Averroists to have some influence on the Latin Averroists, who initially found Averroes' writings (including those of dubious attribution) to be

mostly inaccessible until Hebrew translations of the original Arabic were made available for secondary translation into Latin.

Definition

We can define Jewish Averroism using two distinct methods. The first method is to describe the main shared opinions of its adherents. The second method is to describe the main texts and sources that the Jewish Averroists read, cited, and commented on, including their own written interactions. Using the first method, Jewish Averroists will be defined as those Jewish philosophers who held certain radical, naturalistic positions (which we will examine in more depth in the next part of the article), such as belief in the eternity of the world, rejection of supernatural miracles, the reduction of prophecy to being a kind of intellectual perception (albeit it with the help of the imagination), and seeing Jewish Law as essentially a political and social tool for the welfare of society.

By contrast, according to the second method, it turns out that Jewish Averroists are those Jewish philosophers who were mainly influenced by two principal authoritative philosophical sources: Maimonides and Averroes. This is not at all to say that Jewish Averroists accepted every statement of the two philosophers. There were criticisms of Maimonides, such as that of R. Albalag on the question of the eternity of the world in the 30th chapter of his *Tikun HaDeot*, and even criticism of Averroes, whose determinism was unacceptable to his Jewish readers. Nonetheless, all of the Jewish Averroists took these two philosophers (and through them, Aristotle) very seriously, quoting frequently from their works and in many cases interpreting the one according to the opinion of the other. More precisely, Jewish Averroists tended to interpret critical questions like the eternity of the world according to the esoteric position of Maimonides's *Guide of the Perplexed*, which they saw as identical with the philosophy of Averroes.

These two definitions include essentially the same philosophers. However, there are some

instances of philosophers who fit one definition better than the other. For example, Shem-Tov ibn Falaquera made extensive use of the writings of Maimonides and Averroes, but did not share their more radical opinions.

Some interpreters of Maimonides (and firstly the Averroists themselves) saw him as embracing the same radical positions as the Averroist philosophers. Nevertheless, there are a number of very clear differences that make the Averroists more radical than Maimonides. First, Maimonides expressed his more radical opinions in an esoteric manner, such that anyone reading *The Guide for the Perplexed* without a proper philosophical background might think that the book is not so radical. By contrast, the Averroist philosophers generally shared their radical opinions in an explicit manner. And even when some did use the esoteric stratagem in an attempt to conceal their radical opinions, they tended to either contradict themselves or else claim to believe in the religious conservative position alongside their less-than-conservative philosophical opinion. However, their esoteric subterfuge is much easier to see through in comparison with Maimonides' writing. One giveaway is that in general they do not provide any philosophical explanations for their traditional opinions, basing them solely on the authority of tradition. So when we see a given philosopher reveals a radical opinion based on philosophical argumentation and generally also interprets the Bible according to this radical opinion, but elsewhere claims to be a good traditional Jew who believes traditional tenets of the faith, then we can very easily see that this philosopher does not truly believe in the traditional tenets but only says so pro forma probably only out of political considerations. Philosophers understand the need for arguments to establish belief, and that religious belief cannot go against philosophical truth. Conversely, no philosopher who thinks that certain religious beliefs are opposed or differ from philosophical truth will be influenced by this stratagem. They will see the Averroist writer as a good believer who controls his (evil) inclination to indulge in philosophical argumentation by making the right choice to continue to

believe in the religion's tenets despite his philosophical inquiry. Good examples of this kind of writing are Note 30 of R. Albalag's *Tikune Hade'ot* (on the eternity of the world) and Chapters 5 and 6 of the first part of R. Pulgar's *Ezer Hadat* (on the possibility of the rebirth of Jewish independence).

Philosophical Opinions

Common positions: All the Jewish Averroists held a very radical naturalistic opinion. According to these philosophers, the will of God cannot change, because the supreme perfection of God necessitates total constancy inasmuch as change implies either improvement or degradation, both of which contradict an existing perfection. Nature is the consequence of God's will, which creates nature according to His eternal essence. The conclusion of these propositions is that nature cannot change. This position has some crucial implications for the religious philosophy of the Jewish Averroists, especially regarding prophecy, creation, miracles, and law (Halacha). For example, according to the Averroist opinion, God cannot initiate the granting of prophecy to prophets, for this would imply that God had undergone a change from silence to transmitting of prophetic words. For the Averroists, prophecy is the discovery of eternal truth by the intellect and that truth's practical interpretation by the imagination. In other words, proper use of the intellect and imagination renders one a prophet.

The Averroists also posit that God cannot have created the world after a theoretical state of non-existence as this would have constituted a forbidden change in His will. This is one of the reasons that the Averroists universally adopted belief in the eternity of the world. Similarly, miracles cannot be the result of a new creation, i.e., change in God's will, so they are viewed as the utilization of natural law by the (true) prophets for the purpose of impressing the ignorant masses and making them believe in some true or good opinions. This interpretation obviously negates the traditional religious and philosophical import of miracles,

which are reduced to a mere pedagogical or practical utilization of natural law by the prophets.

As noted above, even the purpose of Jewish Law (Halacha) is strongly affected by the Averroist assumptions regarding the perfection and immutability of God. For the Averroists, Halacha concerns only the perfection of human ethics and society. The practices of the law do not earn any metaphysical or supernatural reward or punishment but only natural benefits, including the establishing of a healthy society, the building of strong family ties, affording humans the wherewithal to dominate their corporeal inclinations, and in general engendering good habits among the Halacha's adherents.

Their negation of life after death comes from Averroes's interpretation of the third chapter of *De anima*. According to this chapter, the only part of human beings that can survive after the death of the body is the knowledge of eternal entity (like a natural law). According to Averroes (and the Averroists), each human knows the same eternal entity – the knowledge of this entity is like a reflection in a mirror. Human knowledge doesn't change the eternal entity or multiply it; after the death of the body the reflection of this knowledge in human brain disappears as the brain that is a part of the body. Against this radical interpretation, there is another explanation of Aristotle that can be adapted with religion easier. The easiest opinion is that of Tomas Aquinas that concludes that the intellectual potential only is enough to get individual immortality.

The Jewish Averroists share also a common manner of interpretation of the Bible (that comes from Maimonides). If some passages (and there are a lot of them) contradict their philosophical opinions, they interpret these passages as speaking to the masses of the people for some political and pedagogical aim. By the extreme utilization of this method, the Averroists succeeded in completely changing the meaning of the Bible, which, they argued, conforms – albeit esoterically – to their philosophical opinions.

Divergent opinions: While sharing the common, defining views described above, the Jewish Averroists were also original philosophers who

consequently had some major points of divergence. This fact is very important because the common image of Jewish Averroism even among some scholars is the image of a very monolithic trend of non-original thinkers who essentially used and developed in the same way the positions of Maimonides and Averroes.

An excellent example of this divergence is their opinion on the subject of natural law, which varies greatly from one Jewish Averroist to the next. According to R. Albalag, for instance, natural law is very basic, and all religions (including most pagan religions) adhere to these very basic criteria. As opposed to the basic natural law, all other laws are not natural and can change according to the historical and social context of the different religions. On the other hand, R. Pulgar held a diametrically opposed position: The Law of Moses is the natural Law, and any law that deviates from the Law of Moses is inherently not part of the only true natural law. According to R. Pulgar, social and historical contexts have no influence whatsoever on the natural law, which is immutable and constant in all political and social contexts. R. Levi and R. Kaspi take a middle position but arrive at it in two distinct ways. Both try to make a bridge between the perfection of the Mosaic Law and the Maimonidean opinion that the Law of Moses comes to fulfill the historical needs of the Jews at a very specific time of their history (*Guide of the Perplexed* III 29–30). But here they diverge. According to R. Levi, due to having exemplary forefathers, the Jews have a better nature than the other nations. For this reason, the best law for the Jews is the best law for all humankind. By contrast, R. Kaspi held that natural law is too perfect to accord with any one specific historical context. The superiority of the Law of Moses derives from its very capacity to adapt according to historical context.

This philosophical divergence on the question of natural law has several philosophical and political implications. For example, given R. Albalag's understanding that all basic religious ideas fall within the rubric of natural law, it follows that we cannot make a moral comparison between different religions or even between different

religious trends within one religion because a very basic upshot of the ubiquitous aspect of natural law is that all religious positions are legitimate. By contrast, according to all the other Averroists, for every religious question, we can analyze what is the best option using an objective moral point of view.

On the question of the possibility of a Jewish return to the Land of Israel and the restoration of Jewish independence, we find significant divergence of opinions here as well. R. Kaspi, near the end of his book *Tam Hakesef*, speaks very positively of the possibility of the return of Jewish independence in the Land of Israel. However, R. Pulgar, in the first part of *Ezer Hadat* (especially chapter five), explains that the existence of an independent state can only be attained through immoral actions and therefore preferred life in exile over returning the Jewish people to the sphere of political independence.

Another example of their divergence is their relation to astrology. R. Pulgar was one of the most outspoken opponents of astrology and devoted the third part of his book *Ezer Hadat* to a critique of astrology. In the view of Pulgar, the stars have no significant influence on the human will or even on human nature. By contrast, most of the On Jewish Averroism in Provence (see Kreisel 2015), including R. Levi ben Abraham and R. Nissim of Marseille, believed that stars have some kind of influence on human nature, and this influence also has some impact on human volition. None of these Averroists supported a completely determinist opinion. However, they maintained a very different opinion from Pulgar on the question of the influence of the stars.

Double truth theory: One of the opinions commonly attributed to the Averroists (Jewish Averroists included) is the theory of double truth. According to this theory, the religious philosopher lives in a sort of quantum state of superimposition, wherein as a philosopher he holds certain specific opinions, while as a religious believer he holds completely opposite opinions. For example, as a philosopher, he can assume that the proofs of Averroes and Aristotle are true and

the world is eternal. Nevertheless, as a believer he need not put any importance on the philosophical arguments and can continue to believe in the creation of the world.

Two Jewish Averroists who used the double-truth theory and conceded that their beliefs contradict their philosophical opinions were R. Isaac Albalag (in the introduction and note 30 of *Tikun Hadeot*) and R. Elia del Medigo (in *Bechinat Hadat*). The question of whether some Christian Averroists also believed in some kind of double truth is beyond the scope of this article. Nonetheless, in the case of these two Jewish Averroists, in the view of this writer, it is very clear that they did not actually believe in this theory but only used it as a kind of esoteric position to help them to conceal their truly philosophical opinions. In the case of R. Albalag, this contention is palpable, for it is quite easy to read note 30 of *Tikun Hadeot* in a fluid manner without the passages that speak about the author's conservative belief (here, in the creation of the world). Therefore, it is probable that R. Albalag added these passages only after composing the first draft of this note in order to make his philosophical opinion (here, in the eternity of the world) more difficult to understand.

Jewish Philosophy, Renaissance

Abstract

The turning point of Western thought and philosophy is, as is well known, the early modern period. Firstly, during this era, philosophy changes its focus from the (meta)physically centered study of establishing the existence and essence of sub- and superlunary worlds and of matter and form to an epistemological preoccupation with questioning the consistency, truth, and falsity of our knowledge through, beyond, and even without the senses. Also, a new consciousness was introduced in the perception of Jewish philosophy, namely, to reduce the vision of the mystery of creation in Jewish narrative philosophy (*arcana mundi*) to a simple account of rites and symbols called religion, a demythization of the Jewish tradition. It was precisely this period which gave birth to the denomination of Jewish philosophy (*Philosophia Hebraeorum*) and Jewish religion (*Religio Hebraeorum* or *Iudaeorum*), which some time later, in the nineteenth century, were summarized in German countries as *Jüdische Philosophie*, defining the history of the Jewish pursuit of philosophy and the history of mysticism, called Jewish wisdom.

Heritage and Rupture with the Tradition

Despite the enthusiasm animating the scholarship of the past 50 years, early modern Judaism can still be considered a field of study that has remained largely untitled. Let me recall two general obstacles that also affect the study of the history of Jewish science and philosophy. A large number of literary works from the period spanning the two centuries from 1450 to 1650 are still available only in

manuscript form, incunabula, or in rare printed editions scattered throughout the world. This situation is due, among other things, to the numerous burnings of Jewish books and documents, the censorship of the Inquisition, and the practice of unscrupulous librarians who used folios of Jewish manuscripts to construct the covers of Christian volumes. To this day, there is no catalogue of European Hebrew manuscripts comparable to Kristeller's *Iter Italicum* (1963, 1967). As other scholars have already noted, we cannot seriously discuss Jewish attitudes to the sciences without an analysis of the material at our disposal, which implies, in the main, the charting of a map of all extant manuscripts and prints, including such secondary sources as Christian notices, Inquisitorial acts, the *Index librorum prohibitorum*.

The focal question, however, is whether we can even speak of Jewish Humanism, or a Jewish Renaissance, at all. If we define Renaissance culture in Romantic terms – that is, if we allow ourselves to be guided by the idealistic conclusions of Jacob Burckhardt (1860) and, similarly, of Cecil Roth (1959) concerning the Humanist spirit of freedom, the origins of individualism, and the birth of the sciences – we run smack up against the obvious reality: the Jews of the Renaissance were neither freer nor more individualistic than in earlier centuries; then, as before, they constituted an alien minority. If, on the contrary, we define the spirit of the Renaissance as a more or less autonomous reflection on the sources of knowledge (the Bible, science, classical sources), embodied in a cult of letters and scholarship, we find in Judaism a timid but nevertheless demonstrable affinity, shrouded though it may sometimes be in the traditional “orthodoxy” of the fathers. Perhaps one of the most evident expressions of the new spirit was, as Ruderman (1995) has remarked, the rise of a new group of intellectuals that grew out of the large number of Jewish students who studied medicine together at university during this period. Cross-pollination between the scattered Jewish communities and Christian environment was greatly furthered with the help of Jewish physicians (and their itinerant lifestyles) and Jewish intellectuals who served as advisers to publishing houses and scholars.

Although initially very hesitant and infrequent visitors to the *respublica litteraria et philosophica*, Jewish intellectuals contributed to, or at least mirrored, some of the ideas, concepts, and movements that came to serve as the coordinates of European philosophical maps in this “new” era. Among these concepts, ideas, and intellectual discourses are the inclusion of rhetoric (and poetry) in the philosophical discourse, conceptions of history and historical truth, the challenges of modern geography, the new sciences and scientific discovery, political philosophy, the debates on the immortality of the soul, and the legal definition of religion and religious ceremonies. All of these find their reflection in Jewish intellectual discourse on the eve of so-called modernity.

Neoplatonism is the first movement to be traced in Jewish philosophical literature. Leone Ebreo (1460[?]-1535) deserves to be mentioned here, taking part in the first stage of the reception of Plato in the context of the Jewish Renaissance.

Tendencies toward Aristotelianism and Averroism show considerable continuity with the medieval Jewish tradition; nevertheless, some philosophers explored particular topics, such as the immortality of the soul, revealing the roots of the modern sciences.

Skepticism is a concept and practice with numerous facets; in this sense, Jewish skepticism is mainly concerned with historical developments in skeptical concepts, modes of learning, and social manifestations of refusal or acceptance, as well as their integration into philosophical, literary, and social aspects of Jewish culture.

Jewish attitudes toward the place of the “sciences” in the curriculum are guided by a pragmatic mentality and approach; in the Renaissance, the study of foreign sciences was considered a challenge and a fulfillment of pragmatic purposes for the Jewish community.

Innovative and Original Aspects

Neoplatonism (Leone Ebreo)

Leone Ebreo is considered the preeminent Jewish thinker of the sixteenth century, well acquainted, indeed imbued with the Neoplatonic conceptions,

ideas, and expressions then current in the Italian Renaissance. His *Dialoghi d'amore* (*Dialogues of Love*), a composition whose form was quite common in the Humanist period, is a celebration of cosmic love as the relationship between God, the universe, and man as the *intellectus agens* in and of this world. Julius Guttman maintained that Leone should be regarded as the “only truly Jewish Renaissance philosopher” (Guttman 1933).

In this view, the *Dialoghi* is to be classified as a work of general philosophy, in the same category as such philosophical disquisitions as Ibn Gabirol's *Fons Vitae* (ca. 1049), which was renowned in the medieval Christian world as a work of both a Christian and a Muslim character.

This, however, was not the case with Leone, a thinker who never concealed his Jewishness in his writings (*Dialoghi*, III, 125b). This was a fact acknowledged both by his contemporaries and by later readers; it is arguable, in fact, that this Jewish consciousness was the very premise and essence of the philosophy that permeates his work. Here, Guttman was correct in stressing the Jewish aspect of a philosophy outwardly clothed in the garment of Renaissance ideology, a product of the Humanist premise inherent in all philosophy of the time. In the Christian world, however, Leone was regarded not as a Jewish philosopher but rather as a skilled physician and author of courtly literature (a kind of a *letterato cortese*). It was only in the Jewish community that he was considered a profound expert on Aristotelian philosophy.

The discussion as to where Leone should be located within the spectrum of Renaissance philosophy surfaces as early as the sixteenth century in mentions of his work. Amatus Lusitanus (1511–1568), a Portuguese physician, refers to him as a “Platonic philosopher” (*philosophus Platonicus*) “who left for us, in writing, divine dialogues on love” (*qui nobis divinos de amore dialogos scriptos reliquit*). Lusitanus had met Leone's grandson, who also bore the name Judah Abravanel, in Saloniki in 1560. According to his account, a manuscript of a lost work by Leone, *De Harmonia mundi* (*On the Harmony of the World*), was in his grandson's possession, and it was this work that had been the subject of

their philosophical discussions. Lusitanus (1620) maintained that the work had been expressly composed for Pico della Mirandola (*divini Mirandulensis Pici precibus composuerat*). The historical evidence is unclear as to whether Leone actually had contact with Pico and whether he wrote a composition on the harmony of the universe, conceivably as the third part of the *Dialoghi*. Carl Gebhardt was of the opinion that Leone mentions the work in his *Dialoghi*. The main difficulty lies in the content of the text. The quotation in Leone's *Dialoghi* that allegedly stems from this lost work deals with astrological matters. If we suppose that the *Harmonia* really was written as a separate composition, then it would have to have been a tractate on the harmony of the world that was in *opposition* to Pico's theses, for Pico did not endorse astrological speculation. On the other hand, Lusitanus' note about it being "but written in a scholastic style" would tend to support the view that we are dealing with a separate composition, since the *Dialoghi* is not a scholastic treatise. At the same time, if Leone really was a *philosophus Platonicus*, it would seem quite strange that he should compose a work in a scholastic Aristotelian style.

Perhaps Lusitanus' expression needs to be interpreted differently. It is of course possible to postulate an intellectual kinship between Pico and Leone and to deduce from that a personal acquaintanceship. Both were concerned with harmonizing of Aristotelian and Platonic philosophies, although tending, admittedly, in divergent anthropological directions. Harmonizing Plato with Aristotle was a project that had already been dreamt of in antiquity and been pursued throughout the Middle Ages down to the Renaissance (*philosophia perennis*). Nevertheless, Jewish philosophers, Leone among them, saw in Aristotle Plato's "bad disciple" who had contributed to the corruption of that wisdom which the ancient sages of Greece had learned from the Jews in Egypt. The harmonization of Aristotle and Plato is thus nothing more than a correction of Aristotle, a *reductio ad Platonem*. To sum up Lusitanus' testimony, indirectly, he provides a pointed description of the nature of Leone's philosophy, which consisted in a

hesitation between Plato and Aristotle. To put it in Leone's own terms, for these philosophers, it was a hesitation between "the physician who was the healer of (ancient philosophical) illness by means of excess" (i.e., Plato) and "the physician who preserves the state of health already produced by Plato, by means of temperance" (*Dialoghi*, III, 117a). It is, of course, not by chance that both Plato and Aristotle are referred to as "physicians," since Leone was himself a distinguished member of the profession, celebrated as such in Naples, Rome, and Venice.

The problem in determining Leone's position among Renaissance intellectuals is not the "Jewishness" of his speculations but the literary and philosophical value of his writings. The reception of his work, which went through 25 editions between 1535 and 1607 and saw various translations into French, Latin, Spanish, and Hebrew between 1551 and 1660, is due precisely to its popular appeal, namely, as an entertaining, nonacademic disquisition on Platonic-Aristotelian doctrines, clothed in mystical, astrological raiment. The quotations from the *Dialoghi* found in Cervantes' *Galatea* and *Don Quijote* and the inclusion of the Latin version in Pistorius' *Ars cabalistica* would tend to support this interpretation. The fact that Leone stressed the Jewish origins of philosophy in general was no obstacle to the reception of his work in Christian circles. Such accents were typical of Christian pansophic philosophies.

Although the first and second Aldine editions (1541 and 1545) of the *Dialoghi* disseminated the story of his alleged conversion to Christianity (*Leone Medico, di Natione hebreo, et dipoi fatto Cristiano*), Leone himself made no secret of his Jewishness and even traced the origins of wisdom (*sophia*) to the religion of Moses. He viewed Jewish scholarship, and himself, as links in the chain of the tradition of ancient wisdom, the origins of which he saw as being Jewish.

It is significant in this context that in citing Jewish authors or personalities, Leone qualifies them with the possessive "our." Among Aristotelian commentators, he mentions "our Rabbi Moses of Egypt" (*Dialoghi*, II, 69b), i.e., Maimonides; he refers to Ibn Gabirol's *Fons Vitae*

as a Jewish work, mentioning specifically “our Albenzubron,” a name known in Christian circles (*Dialoghi*, III, 51a); Moses and Aaron are termed “our saints” (*Dialoghi*, III, 5b). Finally, Leone follows the traditional dating of the Jewish calendar, based on a counting of years beginning with the Creation (*Dialoghi*, III, 50b). There was, however, nothing in these avowals of Jewishness that touched on points of controversy between Christian and Jews. The statements were not considered contentious, since they were historically evident. Rabbi Moses of Egypt and the *Fons Vitae* had, to a certain extent, been canonized at Christian universities and in Christian philosophical treatises, not least because they had been quoted by Thomas Aquinas. The existence of a *computum hebraicum*, with a computation of years different from that of the Christian calendar and originating in the Masoretic tradition of the Bible, had been known at least as far back as Augustine. Leone mentions nothing that could provoke the criticism of his Christian contemporaries (Nelson 1963; Guidi 2011).

This includes his discussion of the creation of the world, which, in spite of its obvious divergence from Aristotelian philosophy, was not a *terra incognita*. Leone states that the idea of time being infinite is in accordance with the teachings of the ancient philosophers but in contradiction with Jewish tradition (*Dialoghi*, III, 65b). As interpreted by most Jewish scholars, the Torah proclaims the absolute beginning of the world (Gen.1:1): “In the beginning God created the heavens and the earth.” In discussing the theories of the world’s creation, Leone makes explicit reference to the historical superiority of Mosaic theology over Greek philosophy. At the ancient school of Jewish philosophers in Egypt, he states, Plato studied the “hidden wisdom” (*sapientia ascosa*) (Idel 1985); this is the “second principle,” which is dependent on the first, that is, God. Although he was a disciple of Plato, Aristotle denied what he could not see and made the second principle (wisdom) the first principle of the universe, God.

It is in this context that Leone mentions Plato’s dependence on the Jewish elders of his time (Veltri 1992). In order to acquire the highest

wisdom, however, more was needed than Plato’s affinity with Jewish literature and tradition. In Leone’s words, “But Plato, who had learned from the elders in Egypt, could ‘hear’ [a Hebraism for ‘learn’] further than others, although this was not enough to enable him to see the hidden principle of the highest wisdom” (*Dialoghi*, III, 125b). The source of this statement is purely Christian, since it is only Christian tradition that speaks of an obstacle that, “providentially,” Plato could not have avoided in his contact with the Egyptian Jews: he could not admit the unity of God, for fear of “ending up being executed like Socrates,” according to the testimony of Pseudo-Justin. This tradition was known in the Renaissance. A later contemporary of Leone and a member of the Florentine Academy, Francesco de’ Vieri (1524–1591), wrote a *Compendio della dottrina di Platone in quello, che è conforme con la Fede nostra* (A compendium of Platonic doctrine in accordance with our Belief, 1577) defending Plato’s ignorance of the unity of God. In the face of the evidence that “Plato did not sufficiently recognize that God is one in nature and essence,” he affirms: “In defence of Plato, I say that although he was wise in terms of human wisdom and although he may have read the Old Testament, where these mysteries are unfolded and adumbrated, he deserves to be pardoned [for his inaccuracies] – because the mysteries were not explained to him by any member of God’s elect. The same can be said of Aristotle, who held God to be one in essence and person” (Monfasani 1997).

It is, therefore, not surprising that Leone introduces his discussion of the difference between Plato and Aristotle within the context of his treatment of the creation of the world and the origins of wisdom and (prime) matter. He considers the divinity to be one in essence, but triune in the prism of human perception, in the process of knowledge. A very similar expression can be found in the Preface to Marsilio Ficino’s *Theologia Platonica*.

As is evident from this text and from an analysis of the third dialogue, Leone’s conception of knowledge owes a great deal to Marsilio Ficino. In explaining the process of knowledge in the

context of the unity of God, he draws on the example of light, the sun, and the mirror. Ficino did the same in his tractate entitled *Orphica comparatio Solis ad Deum*, written in 1449, and later in a book, *De Sole* (Kristeller 1953). The symbolic images of the sun, the mirror, and light also play a significant role in the process of knowledge and in Ficino's theodicy: the *Oratio ad Deum* begins with the verse "*Lumen immensum sine fine lucens | Te videns in te speculansque cuncta.*" Leone dedicated several pages of the third dialogue to a comparison between the sun and God. Leone, like Ficino, refers to the theory of the unity of knowledge, starting from God and reaching plurality in man. In this context, he makes use of the triune form of knowledge, again precisely like Ficino. Finally, he speaks of the triune nature of God as lover, beloved, and love, here too in the footsteps of Ficino.

It is not new to find Jewish authors accepting, even if only epistemologically, the triune nature of God. The first to note Jewish readiness to speak about this topic was Nicholas of Cusa, in dealing with the theory of divine names. The postulate that the sensible signs of the name of God change can be seen in passages such as those of the *Excitationes I* (Guttmann 1902), where Nicholas of Cusa speaks of an *interpretatio judaica* of the Trinity. In his view, the Jews had interpreted the dogma of the Trinity in terms of a triad of divine attributes. The novelty of Leone's statement is his claim that the doctrine of divine wisdom as a unique divinity known in triune form is of Jewish origin, like the process of knowledge, which his contemporaries considered a Christian doctrine. The fact that Leone does not explicitly mention his Christian counterparts anywhere – while making unacknowledged use of Christian doctrines and writings – underlines his subtly polemical attitude toward the academies of his time: in his view, the philosophy of love was plagiarized from genuine Jewish traditions.

On the other hand, this could also be a tacit comment on the impossibility of having an open and conclusive confrontation with his "adversaries." If we consult Jewish and Christian testimonies on Leone, it comes as a surprise to find that there are no Christian writers specifically

interested in his philosophy (Leone 1929). The reception of his work among Italian, Spanish, and French authors in the sixteenth and seventeenth centuries is limited to its treatment of the subject of love rather than philosophical themes. Only Jewish authors pointed out that Leone was indeed a Jewish philosopher. The exceptional reception of his work was due not to the fact that it was a specifically Jewish work on love but simply to the fact that it presented Platonic philosophy in a pleasant poetic style, functioning as a handbook of ideas then current throughout the Renaissance Humanist world. Its handbook-like character is stressed by Alessandro Piccolomini (1508–1579) in the dedication to his *Dell'Istitutione di tutta la vita dell'huomo nato nobile* (On the Institution of the whole life of the Nobleman) in 1540. Piccolomini states that he is planning to write the fourth part of the *Dialoghi* on the effects of love. The *Dialoghi* was recommended as the best book on love composed in the genre of courtly literature. Giuseppe Betussi, Tullia d'Aragona, Benedetto Varchi, and Anton Francesco Doni were among the members of the Italian intellectual circles who evinced interest in Leone's work. His profession of Judaism posed no problem for the reception of the *Dialoghi* in Italy, Spain, Portugal, or France. Even as late as the turn of the eighteenth century, after two centuries of oblivion, the entertaining and educational character of the *Dialoghi* received only praise from the German poet Friedrich Schiller.

In conclusion, the *Dialoghi* is not a philosophical treatise but a vulgarization of philosophical ideas departing from a distinctively Jewish point of view. This was not an approach that was open to debate in Humanistic and Renaissance circles, for it was the alchemical *pietra filosofale*, the philosopher's stone that made it possible to convert all philosophies into the *philosophia perennis*. Seen in this way, Leone's writing was not a major departure and could thus even be welcomed for its poetic style. Leone made philosophical ideas understandable, a task at which Ficino had failed completely. Cosmic love, as emanated in the world of creation, is nothing but the kiss of the lover and the beloved,

a kiss which leads back to the Godhead with the death of a human being – something like Moses and Aaron, who died kissing God. It was for this reason that the *Dialoghi* was destined to become a bestseller in the cultural world of the Renaissance, in spite of its Jewish origin, as Tullia d'Aragona affirms (1547).

Aristotelianism/Averroism

The Renaissance period was also characterized by another particular historical phenomenon, which can be identified as a “Hebrew Scholasticism” (Zonta 2006). On a broader level, if Aristotelianism in the Renaissance survived only in particular intellectual and scholarly circles (such as the University of Padua), it is therefore right to speak of a “Renaissance” of Aristotle (Schmitt 1973; Bianchi 2007). In the fifteenth and sixteenth centuries, Jewish authors compiled philosophical treatises in which they discussed the same questions and used the same methods as contemporary Christian philosophers (Zonta 2006). This tendency seems to be in continuity with Averroes’s interpretation of Aristotle, which had characterized the medieval period. Jewish philosophers, Averroists among them, represent a bridge between the old philosophy and the new learning (Ivry 1983).

The Jewish intellectual élite were exposed to an educational program very similar to Christian instruction. This was the case for Judah ben Jehiel Messer Leon’s academy, in which the classical Jewish religious teachings (*Halakhah* and *Aggadah*) were combined with the study of the liberal arts, consisting of the *trivium* (grammar, rhetoric, and logic) and the *quadrivium* (arithmetic, geometric, music, and astronomy).

Judah Messer Leon (ca. 1422–ca. 1498), one of the most important representatives of Hebrew Scholasticism, is well known as the author of a treatise on the art of rhetoric, the *Sefer Nofet Sufim* (*Book of the Honeycomb’s Flow*, ed. Rabinowitz 1983), but he also wrote commentaries on logic and natural science, namely, a supercommentary on Averroes’s *Middle Commentaries* on the *Isagoge*, the *Categories*, and the *De Interpretatione*; a supercommentary on Averroes’s *Middle Commentaries* on the *Prior*

Analytics and the *Posterior Analytics*; and a commentary on Averroes’s *Middle* and *Long Commentaries* on the first three books of the *Physics* (Zonta 2002).

The particular activity of a Jewish intellectual scholar during the Renaissance does not only include original productions. A further important aspect of his work is characterized by the practice of translation. An attitude of envisaging a new interpretation of ancient philosophers, with special reference to Aristotle and the Peripatetic tradition, may therefore be ascribed to this general translation movement. The *Corpus Aristotelicum* recovers much of the material unknown in the Middle Ages, with the gradual introduction of Greek, Latin, and Arabic commentators. As Ivry (1983) has remarked, Averroism was a major vehicle of expression in Renaissance philosophy, and Jewish scholars and translators worked in the shadow of Averroes. Between the fifteenth and sixteenth centuries, it is possible to identify a first wave of translation (Hasse 2006); notable among these great scholars engaged in the translation of Averroian/Averroist works and other Peripatetic commentators were Elijah Del Medigo (d. 1493); Calonymos ben David, called Calo Calonimo (ca. 1476–1518); Abraham ben Meir de Balmes (ca. 1460–1523); Jacob Mantino (d. 1549); Moses Alatino (1529–ca. 1605); and Moses Finzi (active in 1558). A particular case that deserves to be mentioned here is ‘Ovadyah Sforno (ca. 1475–1550).

A new element emerges compared to previous medieval translations. The interest of these “new” scholars turned toward a particular aspect of the Renaissance tradition. During the Middle Ages, translations of Aristotle were overwhelmingly in the realm of logic and natural science, while in the sixteenth century, philosophers’ speculations revolved around questions about the nature of the intellect and the soul. Despite the topic of the immortality of the soul, suggested by Averroes, being inherited from medieval Scholasticism, no other Arabic philosophical theory received a similar amount of attention in the Renaissance (Hasse 2006). Concerning the commentary on the *De Anima*, we are aware of a translation from Arabic into Latin of Averroes’s *Long Commentary*,

usually ascribed to Michael Scot (ca. 1220), an Arabic-into-Hebrew version of this treatise translated in Rome (1284) by Zerahyah ben Isaac ben She'alti'el Hen (Zonta 2011), a Latin-into-Hebrew translation made by Abraham di Benevento in the late fifteenth century (Zonta 2004), and the Giunta edition of an alternative version of Book Three by Jacob Mantino published in 1562.

In addition to these translations of the book of the *De Anima*, many other philosophical works about the unity of the intellect and the immortality of the soul were translated and noted by the aforementioned Jewish scholars. Calo Calonimo translated the *Libellus seu epistola de connexione intellectus abstracti cum homine* (1527) and Abraham de Balmes translated Al-Farabi's treatise *De intellectu et intellegibili* (1522–ca.1523) and Averroes's *Epitome De Anima* (1552). The most interesting interpretation of Aristotelianism and Averroist theories is offered by Elijah Del Medigo, who should be considered the most important Jewish Averroist in Italy. Del Medigo was commissioned to translate works about logic, physics, psychology, and metaphysics for his Christian patrons (Engel 2017), and he translated Averroes' *Epitome De Anima* for Giovanni Pico della Mirandola. However, Del Medigo also wrote two Averroist treatises (1482), originally in Latin, which were subsequently translated into Hebrew (Bland 1995). The first treatise concerns the unicity of the material intellect and the possibility of conjunction with the active intellect, and the second concerns the immortality of the soul, explaining in detail the incongruence of Averroes's positions between his *Epitome* and his *Long Commentary on the De Anima* part III, 36.

'Ovadyah Sforno is considered the last Jewish scholastic authority (Zonta 2006). He published only one philosophical work, entitled *Or 'Ammim* (1537), which he made available to the Christian Humanist readership through his own translation into Latin under the title *Lumen Gentium* (1548). The most important chapter of this pamphlet (XII) is devoted to the immortality of the soul; in this case, Sforno's position is in marked contrast to that of his predecessors.

The topic of the immortality of the soul was a highly explosive subject at the time, not only for Judaism but also, and in particular, within Christianity. Sara Copia Sullam, an Italian poetess from the Venetian Ghetto, deserves to be mentioned here as a representative of the great Renaissance of Jewish culture in the early modern period concerning the debates on the immortality of the soul. Born about 1590, Sullam was educated in the court culture of her time. She is known to have been able to read Latin, Ancient Greek, Spanish, and Hebrew at a young age, also displaying a remarkable talent for music and poetry (Roth 1930). She cultivated her passion for poetry under the guidance of the poet and man of letters Numidio Paluzzi. Thanks to Sullam's erudition and social graces, her father's house became a literary salon, a regular meeting place for both Jewish and non-Jewish intellectuals in Venice – among them Leone Modena – which was also attended by members of the nobility of Treviso, Padua, and Vicenza (Boccatto 1974). The archdeacon of Treviso, Baldassarre Bonifacio, was a participant in Sara's learned salon. Until recently, it was only known that Sara had written him a letter in which she expressed her doubts about the immortality of the soul. In response, Bonifacio published a small tractate pillorying her heretical views. Sara answered this attack with a *Manifesto*, in which she sought to remove any doubt about her "orthodoxy."

After Sara's debate with the priests, the topics of the immortality of the soul and eternal damnation were discussed with greater vehemence among the Jews, not only in Venice but also in Amsterdam. In 1622–1623, the Jewish physician Samuel da Silva published his *Tratado da imortalidade da alma*, a polemic against the now-lost tractate of Uriel da Costa (1585–1640), a Portuguese Jew who had converted to Christianity and then returned to Judaism, entitled *Sobre a mortalidade de alma do homem* (*On the immortality of the human soul*). In 1623, da Costa replied with the tractate *Exame das tradições farisaicas conferidas com a lei escripta, contra a immortalidade da alma* (Amsterdam, 1623–1624), in which he denied the immortality of the soul. The question was further discussed

by Manasseh ben Israel (*Nismat Hayyim*), Saul Levi Morteira, Isaac Aboab da Fonseca, and Moses Raphael d'Aguilar. This was not just a theological-philosophical discussion; it was also relevant for the question of the rehabilitation of the crypto-Jews, who had been forced to convert to Christianity (Veltri 2009).

Skepticism

In the last century, the study of skepticism enjoyed a spirited academic interest and enthusiastic popularity. Ancient Eastern and Western schools of skeptical thought and philosophy were the subjects of numerous tractates, books, articles, and *prises de position*; furthermore, historical Pyrrhonian philosophy and the classical academies were analyzed and described, and trends in the use of the skeptical method/skeptical methodologies in the Middle Ages and the early modern period were also the objects of substantial investigation.

Moreover, much secondary interest has been devoted to the study of ancient, medieval, and early modern Jewish skepticism. Alvin J. Reines's entry in the old and new editions of the *Encyclopaedia Judaica* refers only to the fideist question of the unreliability of reason, and he quotes Judah Halevy and Ḥasdai Crescas on the inadequacy of Neoplatonic and Aristotelian physics and metaphysics as naturally acquired knowledge. However – he comments – “in their refutations of Neoplatonic Aristotelianism, Judah Halevy and Crescas relied on reason and assumed the validity of empirical knowledge” (Reines 2007). Consequently, skepticism is seen here only as an argument for reinforcing divine revelation.

With some rare exceptions concerned mainly with Uriel da Costa, Aaron d'Antan, and Salomon Maimon or with the everlasting question of whether and how the biblical book of Qohelet should be included in the history of skepticism (Crenshaw 1980), there is little on Jewish skeptical thought on academic shelves. In the learned book on skepticism and irreligion edited by Richard Popkin (1996), the famous specialist in the history of skepticism, there is no contribution on Jewish thought at all (Popkin and Vanderjagt

1993), as though the question had never been dealt with by Jewish academies or scholarship. Only Aryeh Botwinik (1997) has dealt with the topic by emphasizing the role of negative theology on the development of skeptical thought. In his book, Botwinik presents an ideal line which links the negative theology of Maimonides with the negative vision of the Godhead in Nietzsche. He interprets monotheism as criticism and as a skeptical attitude to knowledge based on the negative process of understanding. This is nothing but an apophatic theology aimed at sharpening the philosopher's skeptical sense in approaching the incomprehensibility of God. Negative theology and monotheism above all else are indeed components of Jewish skeptical thought. However, the main question of skepticism is neither negative theology nor the validity and consistency of reason and/or revelation but the controversy in and about authority. According to the philological meaning of *auctoritas*, the term faces and puts into epistemologically questions sources of knowledge (reason, revelation) or people who embody authority – people such as prophets, wise men, philosophers, and messiahs.

The first station for the skeptical train is therefore not primarily Maimonides but Judah Halevy, together with Ḥasdai Crescas and Joseph Albo. They opposed the authority of reason, the intellect's capacity to reach a state of perfect knowledge, and the attainment of perfection via the human sciences. However, we are entangled in a dangerous vicious circle, for only by using reason and empirical methods can we test their validity. We have no other method of criticism apart from criticisms of the source of knowledge. As is well known, the critics do not reach a perfect agreement *per se*, as they deal only with opinion. This is the problem with ancient and modern philosophy in relation to other sources of knowledge such as revelation, which *per definitionem* does not seek to present an opinion but advances the claim of absolute truth. Claims of absolute truth and consciousness of the weakness of human reason are the main points of the “crisis” of the sixteenth and seventeenth centuries.

Judah Moscato (1530–1593) is known as the author of a collection of sermons called *Nefusot*

Yehudah (*The Dispersed of Judah*) and of a commentary on Judah Halevi's *Sefer ha-Kuzari*, entitled *Qol Yehudah*. *Nefusot Yehudah* belongs to the very core of his important oeuvre. Composed in Mantua and published in Venice in 1589, the collection of 52 sermons addresses the subject of Jewish festivals as a kind of liturgical platform for addressing issues in philosophy, theology, mysticism, culture, history, and other arguments important for the speaker and his audience. Moscato's philosophical positions stem from the rabbinical tradition, classical and contemporary authors, and Neoplatonic thought. He does not disdain to quote non-Jewish authorities, predominantly when they seem to confirm his position. This is the case for Heraclitus' sermon (*Sermon XIV: 86*) on the validity of the sciences, a topic of Renaissance philosophy and skepticism.

Moscato follows a perfectly constructed stylistic and rhetorical scheme which consists of constantly repeating a thesis as a refrain by adding more elements which should confirm it. He quotes the Babylonian Talmud to underscore the view that if man relies only on himself, he cannot attain true knowledge. The latter is, of course, to be achieved by means of one's study of the Torah (*Sermon XIV: 34*).

The *philosophia prima* or *divina* as a denomination of metaphysics goes back to the division of the sciences proposed, for example, among the Arabic and Latin schools (Avicenna and Thomas). As a representative member of Western philosophy, it is useful here to recall Roger Bacon, who speaks of the *metaphysica* as *divina scientia*, *sapientia*, and *philosophia prima*. Moscato is of the opinion that the human sciences, because they were produced by human thought, cannot grasp the divine without conjunction with the divine intellect, an axiomatic position, whose truth is notoriously taken for granted. The almost deductive conclusion is that they cannot *per definitionem* attain the truth. The sciences historically collect their knowledge from generation to generation (*Sermon XIV: 78*), as a mirror of the natural order of nature, created in 7 days by God. Two elements of their nature speak against the seven arts as "(divine) science," for they are contingent (the factor of time) and related to the

natura creata (the factor of space/matter in creation). Speaking of the created nature (*natura creata*), it is obvious that he is here discussing the trustfulness of the organs of perception, the senses, a chief argument of skepticism, dealt with some decades later by Simone Luzzatto (1580–1663).

Luzzatto's book is a deconstruction *ante litteram* of the whole construction of empirical knowledge. He assumed that all knowledge, tested by the intellect, is a product of the senses; these are of course not devoid of error. Luzzatto's book is a skeptical approach to ancient and modern epistemology, not a treatise on theology. His intention, as Ruderman rightly stresses following Luzzatto's own words, is to subvert "human knowledge," adopting a mode of reflection that is "tentative, skeptical, and doubting" rather than "dogmatic and assertive" (Ruderman 1995). Some time later, Spinoza used the same method for analyzing "divine" knowledge, the theology of the Hebrew and Latin traditions. In the introduction to the *benigno lettore*, Luzzatto is unmistakably clear: "Socrates confutes human, not inspired knowledge, infused by a superior mind" (*Socrate*, 1). It is difficult to know whether he was aware that the same skeptical method could be used when examining "divine" knowledge. Although the distance from rational to theological skepticism is small, the existing difference between them should be maintained (Veltri 1995). The problem he is trying to resolve is very different from Moscato's division of profane and holy sciences. While Moscato belittled the importance of the sciences, he did not completely reject them. The sciences' main sin is not to search for agreement with the Torah, although their claim is very similar to that of religion, namely, to attain the perfection of God. They are clearly on the false path to obtain it.

In Venice in 1638, Rabbi Simcha (Simone) Luzzatto published a short, apologetic, but highly valuable book on the status of the Jews, the *Discorso circa il stato de gl'Hebrei et in particolar dimoranti nell'inclita città di Venetia* (Discourse on the Jews of Venice). It was an absolute novelty in the history of Jewish political thought: the Rabbi defines the forces which

shaped the function of the Jewish minority in the economy of the *Serenissima* and mapped its scattered geography, its number and traditions, and the stratification of the Jewish population in the diaspora. In this treatise, the Rabbi of the “Scuola Grande Tedesca,” the Great German Synagogue, introduces a non-Jewish audience to the intellectual subdivisions of the Jewish academics, enumerating among the élite the Rabbis, the philosopher-theologians, and the cabbalists.

In a small passage of his *Discorso*, Luzzatto refers to two different controversies: the question of the authority of ancient traditions and a question regarding authority in general. The first question focuses on the problem of the authority of the ancient sages whose sayings and pronouncements are dependent upon the doctrines of their time (i.e., conformity with “the generally held doctrines”). Here, Luzzatto cryptically refers to the opinion of some Rabbis and philosophers that the opinion of the sages and the (scientific) evidence *cannot* be opposed (“they firmly hold that the truths do not contradict each other and that the simple opinion of the ancient sages should not oppose the evidence”). The reader cannot overlook Luzzatto’s commitment to the *obligation* of the theological and dogmatic view according to which revelation cannot be imperfect although it may be opposed to (the scientific or historical) evidence.

The second and consequent question is the priority of the authority of the sages, or revelation, over human reason if “deficient and defective of power, it does not attain it with its argument.” With this expression, he introduces his later treatise on the failure of human reason, his aforementioned book *Socrate overo dell’humano sapere esercizio seriogiocoso di Simone Luzzatto Hebreo Venetiano opera nella quale si dimostra quanto sia imbecile l’humano intendimento, mentre non è diretto dalla divina rivelatione* (*Socrates or on Human Knowledge. The Serious-Playful Exercise of Simone Luzzatto, Venetian Jew. A Work that Shows how Feeble Human Intelligence can be When it is not Led by Divine Revelation*) (1651), where he denies the authority of the sciences, the knowledge of the senses, and logical inference, appealing for systematic doubt.

This can be considered his major work, a very important milestone in modern skepticism (Popkin 1979; Schmitt 1983), and his detailed introduction to the question of human knowledge is a major document of the Venetian reception of European scholarship (Veltri 2011). Luzzatto’s treatise *Socrate* is a little-known book. There are few copies of the original and no translation exists in any modern European language (Luzzatto 2013). There are some allusions to Luzzatto’s *Socrate* in the world of scholarship, but no scholars have addressed the work in its entirety or at length. With few exceptions regarding the acknowledgment of the value of Luzzatto’s works (Bergmann 1936), the first to note the importance of the book was David Ruderman (1995), who summarized its contents and focused on the difficult problem of Luzzatto’s sources and his place in the world of early modern and Jewish scholarship. Mention should also be made of the dissertation by Ariel Viterbo at the Hebrew University of Jerusalem (1997). Viterbo discusses with the book, describing its contents, and promises to present it within a broader context in the future. In his dissertation, he proposes to view and thus interpret the *Socrate* as an intellectual biography of Luzzatto.

The aim of Luzzatto’s book remains to date a strange puzzle because of its entirely “non-Jewish” content, while his earlier contribution, the *Discorso*, is a typical apologia for Judaism. According to Ruderman (1995), even the book’s title is misleading, since Luzzatto does not deal with God and providence. Ruderman’s conclusion on Luzzatto’s position departs from the path traced by Bernard Septimus, who, taking only the *Discorso* into account, sees Luzzatto as a “Maimonides” of the seventeenth century. In this way, he tries to locate Luzzatto’s attempt to weaken and even subvert human knowledge by applying a radical skepticism lying within the process of skeptical philosophy and theology which sees Spinoza as the culmination of this attempt (Veltri 2008).

The Venetian Rabbi gives a very short summary at the beginning of the book (*Socrate*, 3–4). In its assembly in the Apolline temple, the academy of Delphi is deciding whether to proceed

against Socrates, indicted for trying to deny the validity of the human sciences (*Socrate*, 3). In his defense, Socrates enumerates the cause which led him to suspect that the human disciplines lacked certainty. His doubts about their reliability originated in the controversial opinions of wise men on the principles of objects in nature. First, he states that he believed that his uncertainty originated from the different prevailing *opinions* about the senses, objects, intellects, and knowledge, but he later comes to the conclusion that the unreliability of knowledge lies in the *objects* of discussion themselves. The analysis of the external and internal senses (common sense, imagination, and memory) induced him to suspect their validity as sources of knowledge because they were partly erroneous.

Examining knowledge itself, he questions whether there is a doctrine about human affairs. In questioning prudence, he reaches the conclusion that it is better to suspend judgment (*Socrate*, 13), although he admits that it can be harmful to civil life. Hippias advises him not to let his conclusions be known and shows him some civil and political teachings drawn from the observation of the natural world. Timon urges him to adduce proof of the weakness of human knowledge. He attacks captious philosophy: in its curiosity, it affirms an agenda of examining the primordial virtues, concluding with the vices. Socrates tends toward Timon's opinion, praising the person who follows probability.

After Socrates' defense (or explanation of his convictions), the assembly, called to proceed against him, cannot make up its mind whether to pass judgment for trying to deny the validity of the human sciences or to pronounce him innocent. Plato convinces the members of the academy to postpone judgment until a far more opportune time.

The suspension of judgment, the avoidance of agreement, and a sincere following of the probable are Luzzatto's "dogmata" originating in his skeptical thought. The accusation against Socrates, in Luzzatto's view, shows that the opinion of human beings is of such certitude (*Socrate*, 14) that it does not surrender to the torments of "importune discourse." The accused can be

questioned on the basis of the same principle that the prosecutor used against Socrates: use of the "importune discourse," namely, logic. Only with the aid of logic can he convince others that a judgment is not possible: because we do not have certain truths, there is no evidence beyond doubt. The method of proving the uncertainty of human knowledge is of course motivated by the discoveries of his time; it was, obviously, attacked by some churchmen and intellectuals. Luzzatto's argumentation is likewise awkward, encumbered by *loca communia* and vicious circle argumentation.

The Venetian Rabbi deals with visual art in the debate about the validity of sense perception. After the examination of taste and its defects, Socrates takes a close look at sight (*Socrate*, 94). He does not deny its excellent qualities (*egregie qualità*), not only in its function as a mediator between human achievements and events but also in bringing human beings closer to the celestial bodies, even though they remain distant. Allusion is made here to the technical discovery of the telescope, which "proved the mistakes and defects which antiquity, following human discourse, retained as true and sincere doctrines" (*Socrate*, 94).

Some centuries later, a descendant of the Luzzattos, Shmuel David Luzzatto, commonly called Shadal, wrote some notes on their genealogical tree, with reference to Simone's *Socrate*. There, he tries to justify his ancestor's skeptical tendency, referring to the era of Descartes, to the crisis of Aristotelianism and therefore of the Scholastics, and to the genesis of ancient Greek philosophy. Against the background of a skeptical approach to salutary beliefs (*salutari credenze*), Luzzatto, erudite "philosopher and at the same time a religious man" – as Shadal put it – considered it to be profitable to belief and useful to society to lighten the uncertainty of human speculation. Shadal considered the *Socrate* to be an apologetic work designed to humiliate false philosophers for their temerity, supplying the believers with an apologetic arsenal against their attacks.

There is much truth to this. However, if on the one hand Luzzatto argues against the defects of

knowledge gained through the senses and therefore of all knowledge based on this, on the other, he did not “absolve” his *Socrate* of the accusation of having attacked authority. Perhaps he was aware that every method used against the human sciences can also be used against religion.

Luzzatto seems to reject a priori the authority of sciences, the knowledge of the senses, and logical inference, instead advocating systematic doubt. Only doubt can preserve humans from being condemned by the agora, for the agora seeks to preserve truth and accepted moral customs. The deviation is not completely desirable, but it is socially and philosophically necessary.

Science

Jewish attitudes toward the role and place of the “sciences” in the curriculum are guided, in the main, by a pragmatic mentality and approach. In Rabbinic times, the academies officially allowed only a certain élite to engage in the study of the *hokhma yewwanit* (Greek wisdom), which included the so-called sciences, with the primary intent of understanding, or even influencing, imperial decisions regarding the Jews. In his *Moreh Nevukhim*, Maimonides explains interest in the foreign sciences as a reappropriation of wisdom that other peoples and scholars had stolen from Jewish sources (*Moreh Nevukhim*, I:71). In the Renaissance, the study of foreign sciences was considered both a challenge for the present, in completing the curriculum of a *vir doctus* (*hakham kolel*), and a fulfillment of pragmatic purposes for the Jewish community.

One of the initial steps of pedagogical importance was a project put forward by Abraham Provenzali in his proposal to create a new academy (*waad*) in Mantua in 1564. In his view, the Jewish people were running the risk of losing their scholars, while the number of Christian experts in the sciences and technology was constantly increasing. Among the disciplines to be taught in such a college, he listed the study of the Torah, philosophy, Hebrew grammar, Latin, arithmetic, geometry, geography, and astrology (Miletto 2004a).

A pragmatic but purely skeptical attitude is also to be found in R. Yehiel Nissim (Vitale) da

Pisa’s *Minḥat Kena’ot* (Guetta 1999). For him, the natural sciences, such as geometry and medicine, constitute wisdom, whereas knowledge beyond nature (namely, metaphysics), which seeks to explain all phenomena through logical argumentation, is subject to doubt and arrives at false conclusions. Intense scholarly debates took place about the world of the Torah and its connection to the theoretical and practical sciences, as the development of antiquarian and encyclopedic works proves.

The encyclopedic and antiquarian tendency of Humanistic scholarship has also been studied from the perspective of *ars memoriae*, the art of memorizing the world of wisdom and sciences, as a technique that aimed at acquiring knowledge by constructing a harmonic and self-referential world of signs and symbols. Judaism adopts the genre of the encyclopedic organization of the universe of wisdom and sciences as an apologetic need, a fence around the Torah. Jewish scholars wrote to provide their fellow Jews who had been attracted by the non-Jewish environment with a modern, i.e., Humanist, garment in which to clothe accepted Jewish religious ideas and traditions – and, above all, to reappropriate traditions now believed to be of Christian or general origin. That is the case in antiquarian works like Azaria de’ Rossi’s *Meor Enayim* and of encyclopedias like the physician Abraham Portaleone’s *Shilṭe ha-gibborim* (Miletto 2004b). Azaria’s collection of articles on different questions of Jewish antiquities tries to incorporate foreign sources into the evaluation of Rabbinic *realia*. His work is interesting for the history of the Jewish sciences as a first attempt to establish the truth by comparing Jewish and non-Jewish sources, seeking to deconstruct Rabbinic traditions on scientific observations as irrelevant for the modern sciences.

In the case of Portaleone’s encyclopedic work, the scholar’s primary aim is to comprehend the universe of knowledge, already encrypted in the word of the written Torah. Abraham tried to resolve the conflict between science and religion by deriving all aspects of knowledge, even recent technical advances and discoveries such as gunpowder (Miletto 2003), “philologically” from the

Bible – an extreme consequence of the principle that all wisdom belongs to Israel, a notion also expressed by Maimonides (Veltri 1995). That is also the opinion of Simone Luzzatto, developed in his *Socrate*, in which he expressly raises the question of the validity of knowledge in general. Luzzatto presents here the most common achievements of the new sciences, negating their absolute validity.

Impact and Legacy

The Renaissance and the early modern period marked a decisive historical turning point in the history of Jewish thought. Although the works of these scholars cannot really be considered as original intellectual productions, the intellectual history of Humanistic Jewry in Italy was the driving force in modern philosophy. Jewish Renaissance thought reveals the roots of the *Haskalah*, the “German Jewish Enlightenment,” and lays the foundation for a critical and methodological study of Judaism, the *Wissenschaft des Judentums*.

The *Wissenschaft des Judentums* showed a particular interest in the cultural history of Humanism, a tendency probably best interpreted as an attempt by its adherents to discover a foundational act for the emergence of the new “critical” sciences in the arsenal of their own history. In this sense, Azaria de’ Rossi can be considered as the father of the *Wissenschaft des Judentums*. An authentic thinker of the “Jewish Enlightenment” *ante litteram*, he is mentioned in the introduction to Moses Mendelssohn’s translation of the Bible (1783), and he was the subject of the Leopold Zunz’s monograph work *Toledot le-R’ Azarya min ha-Adummin* (1843).

Azaria de’ Rossi does not represent an isolated case: two other biographies, those of Elijah del Medigo and Moses Zacuto, are published in *Ha-Me’assef* (1784 and 1785). The list of Jewish philosophers and thinkers can be extended – as is the case of Isaac Abravanel (Carmoly 1857; Buxtorf 1652; Majus and Bischoff 1708), Leone Ebreo (Zimmels 1886), Elia Levita (Buber 1856; Kahana 1883–1884; Levy 1888; Bacher 1892,

1893), and Salamone Rossi (Birnbaum 1893) – but it is certainly not complete, and we should focus on every single aspect of the *Haskalah* and the *Wissenschaft des Judentums* to comprehend the deeper meaning of those sciences.

Juan de Segovia

Born: ca. 1393, probably Segovia

Died: 1458, Aiton

Dennis Pulina
Department of Greek and Latin Philology,
Albert-Ludwigs-Universität Freiburg,
Freiburg (Breisgau), Germany

Abstract

Juan de Segovia was a Spanish theologian, best known for his role at the Council of Basel, as

well as for his thoughts on a peaceful, rational resolution to the conflict between Christianity and Islam.

Synonyms

[Johannes de Segovia](#); [Juan Alfonso González de Segovia](#); [Segovianus](#)

Biography

Little is known about Juan de Segovia's early life. He began his studies at the University of Salamanca in 1407 and graduated with a *baccalaureus* from the Faculty of Arts in 1418. He was then appointed to a chair, most likely to interpret the scriptures. The title of *magister in sacra pagina* was bestowed upon him in 1422, and in 1432 he became *magister in artibus*. To confirm new statutes, he represented the University in 1421 before the Pope, and in 1427/1428 he became a papal *referendarius* in Rome. As part of the entourage of Juan II of Castile and León, he arrived in Medina del Campo in 1431, where he had a formative conversation with the Muslim ambassador of the Emir of Granada about Christians and Muslims. His time at the Council of Basel, where he was appointed in his own right in 1433, then in 1434 as a representative of the University of Salamanca, was a significant period in his life. He died in 1458 in Aiton as Titular Archbishop of Caesarea.

Heritage and Rupture with the Tradition

At the Council, he mainly represented the doctrine of the Immaculate Conception of Mary and devoted himself to theological issues associated with the Hussites and the Orthodox Church.

Later on, he began work on a monumental history of the Council and wrote ecclesiological works, including the *Liber de magna auctoritate episcoporum in concilio generali*, in which he considers the episcopal college as a mediating authority between the papacy and the Council.

Due to the question of superiority between the Council and the Pope in Basel, de Segovia endorsed the election of Felix V as antipope. He argued for the Church as a *corpus mysticum*, whose head is Christ.

Motivated in particular by the fall of Constantinople, de Segovia dealt intensively with Islam from 1453 onwards. Opposing to the idea of Crusades, his important work *De gladio divini spiritus in corda mittendo Saracenorum* is an expression of his policy of a *via pacis et doctrinae* for mediating with non-Christians. Although he accuses the Saracens of having a false image of Christianity, particularly because they charged Christians with idol worship and polytheism, de Segovia recognizes some true teachings in the Quran, noting that there are commonalities between the religions. On this basis, as well as due to his experiences in Spain, de Segovia pleads for intellectual discussions among scholars.

Innovative and Original Aspects

In his portrayal of Islam, de Segovia draws on many medieval elements, reproaching Islam in particular with an affinity for violence, a lax sexual morality, and the promise of a sensual paradise. In addition to further developing these arguments, he bases his reflections solely on the Quran, using no other sources, and clearly separates his argumentation into description, analysis, and refutation (*De gladio*, ed. Roth 2012). For this purpose, he studied Islam with great care and even had a trilingual edition of the Quran made in Arabic, Castilian, and Latin (which is now lost).

Justice in Renaissance Philosophy

Thomas J. Kuehn
Clemson University, Clemson, SC, USA

Abstract

The classical ideal of justice remained vibrant in the Middle Ages because it was embodied in the surviving texts of Roman law, the *Corpus Iuris Civilis*. From there, it entered canon law, where it gained strength from its association with the divine giver of justice. Justice in the classical tradition was an ideal of distributive justice, a socially fair allocation of things, rendering to each his due. It was an ideal ostensibly linked to outcomes, independent of process. Ideal and practice were never necessarily coincident, however, and it was along that fissure that humanist critiques of law and its practitioners, beginning with Petrarch (20 July 1304–19 July 1374), launched largely ethical arguments. Justice, itself an ethical construct, was being lost, said humanists, in

procedural delays and cascades of citations and references, and in bad Latin, that seemingly served only to line the pockets of lawyers, judges, and notaries. By the sixteenth century, the ethical arguments had spilled over into epistemological attacks as well. The quasi-sacred quality of the classical legal texts was confronted by a more thoroughly historical construction of those texts, most frequently associated with the Italian jurist Andrea Alciato (8 May 1492–12 January 1550). This gave birth to such a different method of reading the texts of the Corpus that it came to be called the *mos gallicus*, in contrast to the older *mos italicus*, associated in many minds with the fourteenth-century jurist Bartolus of Sassoferrato (1313–1357). Against the assertion that no professional jurist could operate in any other fashion (*nemo iurista nisi bartolista*), lay the argument that justice lays in appropriate laws that served a people in their peculiar historical context. The legislator (most prominently a king, such as that of France), rather than the academically educated interpreter, was looked to as the font of justice. Justice could thus be reconceived, as it was by figures, such as Jean Bodin (1530–June 1596) and John Locke (29 August 1632–28 October 1704), in terms of a particular state and its ruler and its people, and natural law became unhinged from the realm of objective patterns of behavior and bound to subjective rights instead.

Heritage and Rupture with the Tradition

The medieval ideal of justice derived from Aristotle (*Nicomachean Ethics*, Book 5) and Cicero (*De Officiis*, Book 1). It was encapsulated in the great compendium of Roman jurisprudence, the *Digest*, assembled on the orders of the emperor Justinian I (c. 482–565) in the sixth century, and in the law school text, the *Institutes*, composed at the same time. The latter begins with the statement that “justice is an unswerving and perpetual determination to acknowledge all men’s rights” (“Iustitia est constans et perpetua voluntas ius suum cuique tribuens”: Justinian 1987). The

corresponding passage in the *Digest* added, from the jurist Ulpian, “the precepts of the law are these: live honorably, do not harm another, render to each what is his” (“iuris praecepta sunt haec: honeste vivere, alterum non laedere, suum cuique tribuere”: Mommsen et al., D. 1.1.10). The ideal was a form of distributive justice appropriate to civil law, as opposed to retributive justice typical of criminal law.

Aristotle had treated justice under two headings, general and particular. By the first, a just man deals fairly with all others; by the second, he renders what is due (proportional) to their merit and worth. Both are distributive. Both leave ample room for justice to vary by social status, gender, age, or any other form of discrimination of persons enshrined in law. Cicero added an emphasis on the natural law basis to justice, which could then be determined by the rational human being. He formulated it as *suum cuique tribuere*, which was then picked up by the later jurist Ulpian (d. 228) and thence found its way into the *Corpus*. It did so because the law (*ius* in Latin) was such because it was just (*iustum*); its source was justice. Justice belonged in the realm of the sacred as a moral science, and its interpreters were to consider justice as something more than the simple certainty of application of particular rules or customs. In that regard, in the welter of laws and customs across medieval Europe, it was the *ius civile* that was considered to have claim to being in fact *iustum*, to being justice, rendered in writing (*ratio scripta*). As a whole and in its many institutions and provisions, Roman civil law became the standard by which all others were supposed to be measured.

From its privileged position in the texts of civil law, the Ulpianic ideal of justice entered into canon law. Gratian’s pivotal twelfth-century *Decretum* (Dist. 1 c. 2) agreed that law (*ius*) was such because it was just (*iustum*: Gratian 1993). The power of this vision in the medieval world rested on the fact that, in the words of one eminent historian of law, “medieval society was legal, because it was described and preserved by law, its most profound constitution was legal, and there stood its essential aspect, there stood its ultimate worth” (Grossi 1995, 14).

The medieval ideal was a thoroughly ethical vision of justice, as a movement of the will (*voluntas*). Justice was generally classified as one of the four cardinal virtues, along with prudence, temperance, and fortitude. The location of justice in the will (Quagliioni 2004), with a subjective habit of the soul (*habitus animi*) (Cortese 2000), inserted ethical concerns into any discussion of law. It was also a vision that posited a tension between the effects of laws and their ability to mirror transcendent justice. Gratian's treatment of *ius* as *iustum* immediately raised the distinction between the legal and the equitable.

A recurrent object of discussions of justice was the parable of the workers in the vineyard (Matt. 20:1–16), as their equal pay over a workday of different lengths raised the issue. Justice in that case emerged only on an allegorical reading of divine law. But were justice to be considered purely in the realm of human law, then the “constant” and “perpetual” nature of justice, as emphasized by Gratian, became problematic. Against the unchanging ideal of justice lay the malleable and elastic nature of human laws, and so discussions of justice easily turned to equity and the problem of making just resolutions of cases.

Law, of course, came in different types. The central distinction was between divine and human law. St. Augustine (13 November 354–28 August 430) drew up the model by which divine law, most certainly just, sat on top; natural law, as divine law manifest in nature, came next; and beneath those laws was human positive law, legitimate if not in conflict with the other two (Janin 2004). Justice was the source of law, not vice versa. Law's function was to bring justice to bear in human society (Cortese 2000). Natural law had, by this account, an objective quality as a creation of God. It could be known through observation of behavioral patterns, and norms could be known as grounded in the acquired nature of longstanding habit and custom. Written laws could give precision to such norms, but they also carried the danger of removing them from their origin in the natural.

The chief structural complication to the realization of earthly justice lays in the confusing and overlapping array of positive laws: canon law, Roman civil law, statutes, and other written

enactments of political entities ranging from kingdoms to small principalities and cities, rules of corporate bodies such as guilds or universities, and local customs taken as normative. These were an amalgam of resources to hand whenever there was conflict or doubt as to what was *suum* and to whom as *cuique*. Canon and civil law pretended to universality, and in conjunction with some other elements, chiefly as taught in the law schools, beginning with Bologna in the twelfth century, came to be seen as a “common law” (*ius commune*: Bellomo 1995). These then most closely approximated a standard of justice, and their texts were read as such, as *ratio scripta*. But canon law had its system of courts within the church, culminating (in appellate but also in precedential terms) in papal Rome. Civil law had no system of courts but was variously allowed as a basis to norms and/or a standard of reasoning and justice in local courts (Venice, e.g., notoriously excluded academic jurisprudence from its civic courts, though she had to accept the traditions of its use in its terra firma empire). In such a legal situation, the need for interpretation of norms in relation to case facts and social practices was continuous and often pressing.

The Aristotelian notion of justice treated it as a corrective, commutative process to remove imbalances and disproportions, which derived from inevitable defects in law from its universality or rigor (Berman 1983). To make any given law just (*ius dicere*) applied equally to drawing up written rules as to pronouncing sentence (Bellabarba 2008). Thomas Aquinas (1225–7 March 1274), in elaborating on Aristotle and the *suum cuique tribuere*, saw justice in relation to practices such as the voluntary exchanges of the marketplace (Shaffern 2009). Justice was a virtue that ordered the interpersonal and social, even if it at times resulted in inequity. Aquinas took cognizance of the linguistic and conceptual distinction between law as a system, the objective of justice (*ius*), and law as a way to rationalize (*ratio*) that justice (*lex*). He found as well that one-dimensional senses of law always ran into problems: a concern to write down and fix law would come to difficulties when there was need for change, whereas every sense of a norm would come to a need to fix it in writing

(Quagliani 2004). The two virtues, *ratio* and *aequitas*, mitigated the rigor of written law and underwrote the medieval image of justice (Bellabarba 2008).

The two greatest civilian jurists of the fourteenth century thus took different approaches to the texts about justice. Bartolus of Sassoferrato (1313–1357) focused his discussion of the definition of *iustitia* on the term *constans*. He noted that another text dealing with a mother's remarriage entertained differing senses of what was just. The parable of the workers in the vineyard being paid the same whether they began work in the morning or evening was something to be taken "mystically" and "figuratively," but it led to the conclusion that humans were not by definition "constant" but had a limited possibility of being so (Bartolus 1560, to D. 1.1.10). The law made up for this limitation by being a systematic form of wisdom, arming the best of all the professions (*artes*) whose practitioners could ferret out false sentences and arguments. Bartolus' illustrious successor, a man noted for his philosophical approach to law, Baldo degli Ubaldi (1325–1400), gave *iustitia* a different twist. Justice could be taken as "perpetual and eternal wisdom" ("perpetua et immortalis sapientia"). Justice by this account was a type of perfection of the immortal soul that inhered in the conscience. It was not mere opinion, which necessarily contained an element of doubt, and which was not in accord with *aequitas rationum*. But in reality, a judge was best advised to follow the law of the court, not his own conscience. What was needed was the judgment of a *bonus vir* who did for another what he would do for himself in the circumstances. "He is a good man who is furnished with innocence of counsel" ("Est autem bonus vir ille qui innocentia consilii pollet": Baldo 1585, to D. 1.1.10). Thus both jurists, Bartolus and Baldo, by different routes, drew attention to the variance between absolute justice and what humans at their best might be able to do.

Judges were the ones in the position of interpreting the laws, but unless their roles were long term and at least quasi-professional (as the justices of the royal courts in England), they were

not in fact usually well versed in the laws. Academically trained jurists were, to the contrary, well equipped to serve as the "priests" of the law, upholders of the principle of justice (Quagliani 2004). To them jurisprudence was a *vera philosophia* for a proper civil society (Quagliani 2004; Kelley 1976). Doctors of law had great authority and an easy involvement in civil political affairs (Ascheri 1999; Kirshner 1999). The outstanding exception to that rule was Venice, which began from a basis of Byzantine law but without a scholastic apparatus to train judges. In Venice, judges were laymen who were expected to use discretion in reaching judgments and settling conflicts (Shaw 2006).

Innovative and Original Aspects

The elevation of law, of justice, as civil science, put it in the crosshairs of anyone discontent with that order and justice. None, it seems, were more discontent in the Trecento than Petrarch, himself a refugee (traitor was his term for it) from the formal study of law in Montpellier and Bologna. His criticisms were of law, not of justice. His sense of justice remained profoundly moral and conservative, as one might expect from an admirer of Cicero. Petrarch decried the failures of law's practitioners, those pretentious jurists, to be eloquent in their writings and just in their judgments. He accused them of prolonging cases with arcane arguments to wrest more fees and burnish their authority. Deflating the standing of jurists and questioning the functioning of law was not to question the notion of justice, but it was to make it central to discussion.

Subsequent to Petrarch, notably so with the Florentine chancellor Coluccio Salutati (16 February 1331–4 May 1406), law and medicine came to figure in what has been called the *disputa delle arti*. The *disputa* was about justice, as it ostensibly gravitated around arguments concerning the relative superiority of law or medicine. Salutati, himself a notary whose productions in that earlier phase of his life conformed with the very unclassical vocabulary and forms of legal Latin, penned a doctoral oration that invoked

Ciceronian themes of law as the fount of *amor bene vivendi*, an “expression of the participation of the human race in divine reason and as the basis of the *forma et ratio vivendi*, that is of the political constitution” (Quaglioni 2004). Salutati was no different on the divine origins of justice than the jurists he rubbed shoulders with in the streets and civic buildings of Florence. He expected the active assistance of trained jurists in framing laws. But he stressed the equitable function of law, its application to changing circumstances (Krantz 1971; Manzin 1994). He would be the first major figure in what became a Florentine humanistic tradition of criticism of existing laws and courts against an the ideal of civic (and ancient) justice.

Subsequent Florentine chancellors, Leonardo Bruni (1369–4 March 1444) and Poggio Bracciolini (11 February 1380–30 October 1459) brought to law a historicizing vision, less concerned with changes in law but with context and equity. They criticized well-known jurists, such as Cino da Pistoia (d. 1336–1337) and Dino del Mugello (d. 1303) for knowing only law (not a fair assessment of Cino, a poet among other things). The necessity for dealing with change seemed to reduce the claims of academic legal sciences to any sort of superior eternal truth. Humanists read away the professional apparatus of textual glosses, arguing in contrast for reading the texts of law themselves. Bracciolini complained about the mercenary nature of legal practice and the plethora of conflicting interpretations, in contrast to the serene detachment of the classical scholar. The role of the legislator in meeting that need of shifting cases was at least as important as that of the academic interpreter, perhaps more, as the legislator arguably knew the immediate local context, in contrast to the aloof standards of the texts of civil law. It is also worth noting that university-trained lawyers were the chief rivals of humanists for intellectual and cultural prestige in civic contexts. The lawyers enjoyed the institutionalized advantages of the law schools and guilds of jurists. The humanists had whatever prestige their pens and social connections could earn them, and targeting lawyers was aiming at low-hanging fruit.

The critiques of Lorenzo Valla (1405–1 August 1457) were different, more grammatical and epistemological. Valla took on Bartolus directly, denouncing him for ignorance of historical meanings and for barbarous Latin style. Valla, however, was not in a position to anticipate real legal change. He could mount an acerbic attack on the iconic figure of Bartolus without having to look to the implications for practice and legislation.

One element that made the critiques by humanists so telling was the fact that many had studied law, at least for a while, and worked in close association with notaries, attorneys, judges, and legislators. Perhaps a most telling critique, but one less well known for lack (until recently) of a modern critical edition, was that of Leon Battista Alberti (14 February 1404–20 April 1472) in his *De iure* of 1437. Written supposedly at the request of a friend who was a judge in nearby Prato, *De iure* proceeds to examine a judge’s role through the verbal exchanges of the figures in this typical humanist dialogue. The verbal exchanges studded with classical references poke sarcastically at the number of books jurists used. They also are denounced for reducing the law to its dimension as a lucrative profession, marked by ignorance of the function of law in disputes. As opposed to aiming at a science of knowledge and at the application of first principles, jurists put forth needlessly complex opinions. Alberti, himself the holder of a law degree, suggested to reduce the influence of lawyers in proceedings and to increase that of judges. Judicial discretion was needed to quell doubt where controversy had arisen or to bridge the apparent gap between positive and natural law.

The later Florentine chancellor, Bartolomeo Scala (1430–1497), described in contemporary records as *doctor* and *iurisconsulens*, in his *De legibus et iudiciis* (1483), employed dialogic figures, including Bernardo Machiavelli, father to the political theoretician Niccolò, to explore the problems of resolving disputes in the face of lawyers’ interminable arguments and piles of books. The law as practiced lacked certainty, and that meant it lacked justice. But the fault was not with the law, Scala concluded, it was with the misguided interpreters of it. “With

nature leading and pointing the way, everyone could arrive at truth using his own wits; but when arguments are piled up to demonstrate or refute conflicting claims, no one can distinguish the truth” (Scala 2008, 179). A natural and rational ethical standard could be lost behind written laws.

Such concerns may have been raised more consistently, not to say eloquently, in Florence due to the visibility of the city’s humanists and their ability to find an influential audience, as well as to the parallel issues thrown up by the Arno city’s turbulent politics and increasing (and largely extralegal) dominance of the Medici. But other cities faced similar issues, and people there generated their own debates and keyed in on those of Florence. *Novelle*, as humorous stories, reaching back to Giovanni Boccaccio (1313–1375) in the mid-Trecento, crafted narratives around the particular justice due to their characters, which invariably contrasted to the rigors of law. These tales were correctives of sorts to the law and to philosophical and theological notions of an absolute and unchanging justice (Langer 1999). One historian has drawn a similar contrast between a textually fixed (though revisable) state law and a justice negotiated on a local scale (Sbriccoli 2001). The reality of court cases was that litigants had to be wary of the processes and of the rules. As one scholar of litigation has remarked, “they feared the beginning of a penal case, an expensive affair, laden with risks and uncertain in results, beyond a possible motive for retaliation: it was required then to be prudent and proceed to a denunciation [to a court] only in cases in which there was no other remedy to pressure an adversary save abandoning the legal action undertaken, as was indicated by the small share of proceedings that were concluded with a formal sentence in the old regime” (Bellabarba 2008, 83). The types of procedures employed, accusatory or inquisitorial, and the availability of less formal, more abbreviated processes, had something to do with the confidence to take a case to court and to see it through (Vallerani 2012; Cerutti 1995). Even then, the judicial conclusion might only become a condition for the opening of the next phase of conflict resolution intent on a

negotiated settlement, in which each party might more likely see something like his due.

Yet, alongside all these criticisms, there endured also a positive image of law and the legal professional. “The jurist was the very model of the secular intellectual” (Kelley 1988), and the ideal of the perfect jurist would animate thinkers up to and including Leibniz (1 July 1646–14 November 1716). It was an ideal that suited a Platonist approach to justice, merely replacing the philosopher-king with the philosopher-jurist, whose wisdom resided in his knowledge of canonical texts on a wide variety of subjects. By the sixteenth century, this image would be set in the outpouring of treatises, which appeared in a number of languages, prescribing the education of the perfect jurist who was equipped to seek and dispense justice.

Impact and Legacy

By the end of the fifteenth century, the epistemological status of the texts of Roman civil law was under question, among others by Angelo Poliziano (14 July 1454–24 September 1494) in Florence (Krantz 1971). The capture by Florentines of the *litera pisana*, an older copy of Justinian’s *corpus* that had some significant variations from the vulgate version disseminated from Bologna since the twelfth century, had a powerful impact in historicizing the law. Poliziano was able to study it firsthand (part of the irony of that text’s removal, at the behest of Lorenzo de’ Medici, from Pisa, where the Florentine law school was relocated, to Florence, where the humanistic arts curriculum and its teachers remained). Poliziano’s account of the law as historical artifact, along with his questioning of certain passages and their meaning, had an effect on those rulers or ruling bodies looking for a way and a justification around certain limitations of the law as practiced. But the historical account of law had limited effect on practices, especially in politically fragmented Italy, where the traditions of academic jurisprudence and the social prestige of its experts were entrenched.

The Milanese jurist Andrea Alciato was one who brought a historical perspective into

teaching. He could and did raise distinctions between Roman legal institutions and what those areas of law had become in the light of scholastic legal reasoning and prevailing practices. Alciato's advisory *consilia*, however, as professional interpretations for actual cases, continued to conform to prevailing methods and styles of argument, which were largely unhistorical and unclassical. Still, his academic perspective, rolled out at a time of rapid political change for the states of war-torn Italy, including in spectacular fashion in Milan, gave credence to broad shifts in laws worked out by conquering princes.

That the events of the Italian Wars (1494–1559) presented all sorts of problems for formulating a consistent view of justice is perhaps best seen in the works of the foremost analyst of the political turmoil, the Florentine Niccolò Machiavelli (1469–1527), himself the son of a modest doctor of laws. Justice or its lack was linked with force in his thought. The language of jurisprudence was the language of power. Machiavelli's contemporary, Francesco Guicciardini (1483–1540), holder of a law degree who practiced in Florence in his younger days, easily transposed the professional language he had learned into his later political and historical writings. But it was a different world than that of his youth. He himself acknowledged that the princes were not as they should be but simply what they were. The language of jurisprudence (such as the public discourse of *pro-et-contra* disputations) gave new reflection to manifestations of absolutism, to a power that no longer pretended to stand beneath the law. Guicciardini remained the jurist and looked to jurists for justice, but no longer as a certain science of the right. As one historian has said, "discretion for Guicciardini is practical reason, the correct judgment of the jurist, which takes his unique knowledge as *sapientia* [wisdom] and *prudencia* and not as *scientia*, because he knows that the legal rule, unable to discipline every particular aspect of reality, always has need of interpretation and of the interpreter" (Quaglianone 2004, 118). The way to put that interpreter into the position where discretion mattered was to make the doctor of law also the judge. The Florentine Ruota of 1502, itself an

imitation of the Roman court of the same name, was just one example of this new trend, as was the German imperial Reichskammergericht in 1495. But now what made the interpreter effective was less his systematic education as a doctor of law than his experience as interpreter of situations, motives, and possibilities in relation to the law (Prodi 2000).

Jean Bodin, in a context of lively discussion of the sources of law and the power of the royal legislator, and in the context of a France riven by sectarian conflict, employed the tools of the humanistic jurists and arrived at the point of contesting the definition of justice and natural law of Ulpian that graced the Roman texts. He arrived instead at the idea of founding positive law in natural reason and the justice of royal legislation for a particular realm that was not necessarily applicable everywhere. Now natural law began to figure as a set of rights each Frenchman held (varying by legal status). These rights were subjective and deduced a priori. Justice itself was a matter of tempering rules to cases, especially in terms of the status of the persons involved – a combination of law and equity. Any sense of precedent remained weak. Where natural law had once been a matter of custom, precedent, and the reason written into Roman law, it was now in transcendent principles that demonstrated the deficiencies of the older views. Positive law was to conform to those principles. But that would also leave justice enmeshed in positive law, not to be questioned, unless it were possible for someone to claim superior understanding of those transcendent principles. The royal claims could easily become transcendent themselves, as they seemed to be in Bodin's elevated sense of the sovereign. It would not be until well into the eighteenth century that some plausible critiques of royal laws and justice could emerge.

It was the Dutchman Hugo Grotius (10 April 1583–20 August 1645) who postulated a basis for positive law in a natural law that was not the same as divine law and yet was not reduced to positive law as the will of a legislator. Grotius's natural law, however, was not based on reason per se but on the observable contracts among peoples that

formed the basis of an international law beyond the whims of any one sovereign in any one place. His *De iure belli ac pacis* (1625) rested on a secularized sense of natural law, as he wrote from the midst of the last great spasm of religious warfare in Europe. He examined the issue of justice in going to war (*ad bellum*) and in its conduct (*in bello*) without an eye to matters of sin and divine law.

With John Locke, who based government on the consent of the governed – the same consent (will) that made justice a virtue – justice became a matter of rendering to each his rights. Subjective rights, inhering in individuals by natural law, had more than ethical status. They gained a full social and political dimension, as people tied their rights to life and their labor to a social contract with others. And a figure like Leibniz, who was drawn to conventional images of jurisprudence, also contributed powerfully to the new method of natural philosophy, which left no room for the conventional jurist. The new ideal of a naturalistic social and political theory looked to legislation and codification, rather than interpretation, to locate justice.

Interconnections

When the US Declaration of Independence asserted that king and parliament had been unjust, had transgressed natural law, and had deprived colonists of natural, God-given rights, the notion of justice had come a long way from *suum cuique tribuere*. There was no weighing of what the colonists, in turn, might have owed the mother country. There was an absolute balance to be taken into account. It is the same absolute justice that is supposedly achieved by a trial verdict, a justice weighed in terms of the political unit, and not in terms of compensation for victims of criminal or wrongful acts, for example. From the social, ethical, ideal of justice in classical and medieval terms, through a historicizing examination initiated by humanists, justice came back to an ideal that now ignores, or at best assumes, the social.

time. Martin Luther’s doctrine of justification by faith alone individualized salvation thereby depriving the papacy of all authority, and eventually abolishing purgatory. For Protestants, eternity, heaven or hell, was determined at a specific point in the Christian’s life when he or she accepted God’s grace and his promises in the Gospels. Thus, the true Church was a priesthood of believers justified by faith alone. For Catholics, justification was a process during and after life, but in the debates of the early sixteenth century the Catholic conception of a fearful, physical purgatory was transformed into a happy spiritual state of love. For Catholics, Luther’s doctrine broke the intertwined theological virtues of faith, hope, and charity. Given the health-care crisis of the early sixteenth century, Catholic scholars worked to achieve a compromise with Luther by making charity, a subset of “works,” essential for justification. This “double justification” was rejected during the Council of Trent contributing significantly to the permanent religious schism. Philosophically, the justification debates of the early sixteenth century altered conceptions of time in both Catholic and Protestant theologies.

Justification, Renaissance Conception of

Daniel A. Crews
University of Central Missouri, Warrensburg,
MD, USA

Abstract

Traditionally, justification, i.e., eternal Christian salvation, was a lifelong and afterlife process. Most Christians expected to spend time in purgatory, a painful, physical space for sins not “satisfied” on earth. Prayers of the living, masses for the dead, and after 1476, indulgences for the dead could reduce purgatorial

Heritage and Rupture with Tradition

The Renaissance debate about “Justification” began before Martin Luther’s *Ninety-Five Thesis* appeared in 1517. The *Ninety-Five Thesis* questioned papal authority to release souls from purgatory, with subsequent debates leading to Luther’s appearance before Emperor Charles V at the 1521 Diet of Worms. However, humanists in Charles’ court also questioned papal authority to grant indulgences and the physical reality of purgatory. In 1522, Luther translated Erasmus’ 1516 Greek *New Testament* into German and inserted “alone” to Romans 3:28, thus, establishing Luther’s doctrine of Justification by Faith Alone which nullified all papal authority. Logically such a doctrine precluded the existence

of purgatory, but Luther went back and forth on the topic and did not clearly and completely reject purgatory until 1530 in his *Revocation of Purgatory*. The debate about justification could be surmised as a Protestant view of a onetime experience of receiving God's grace based on believing in Christ's death and resurrection to wash away all sin, versus the Catholic view of justification as a life and afterlife process of purification of sin in which the living could aid the dead. The Renaissance debate about justification was rooted in the doctrine of purgatory.

Originally vague and abstract, the doctrine of purgatory became concrete in the High Middle Ages. By the thirteenth century, most theologians and lay Christians believed in three overlapping chronologies: temporal, purgatorial, and eternal. Temporal, earth time began with creation some five to six thousand years earlier and would end with Christ's second coming. During that span each Christian entered into and departed from the physical world whereupon most expected their souls to enter purgatorial time in a defined space near hell, a truly demonic and frightful residence where each sin not sufficiently satisfied on earth merited a sentence measured in thousands of years. Sooner or later all souls entered the third chronology, eternity: hell for souls stained with unsatisfied mortal sin at death, and heaven mostly populated by souls who had endured thousands of purgatorial years (Eire, 2010; Le Goff, 1986).

Humanists had joked about purgatory years before Luther. In his 1508 *In Praise of Folly*, Erasmus ridiculed those who attempted with mathematical precision to count their centuries, years, months, and minutes in purgatory for their worldly shortcomings. While Erasmus joked about the doctrine, civic-minded humanists in Italy began to view the doctrine as a danger due to the syphilis epidemic that began in Italy in 1493. Combined with the recurrence of plague locally every 20 or so years, a health crisis gripped Europe in the early sixteenth century leading many Christians to question the relation between charity and purgatory, specifically indiscriminate giving of alms to beggars because of the risk of

contagion. When the syphilis epidemic hit Genoa in the 1490s, Caterina Fieschi Adorno checked the Grim Reaper's scythe with all her physical and spiritual might. Catherine, a laywoman, served as rector of the city's General Hospital (L'Ospedale di Pammonte) and was later canonized for her work. St. Catherine's experience and devotional practice led her to claim to have seen purgatory, and her conception of it was close to the eventual Tridentine doctrine. Catherine saw that souls in purgatory were happy and their pain spiritual. Implicitly Christians could, like Catherine, purge themselves in life with the cleansing act of charity engendered by a burning love of God. She had been "illuminated," purified by the fiery furnace of rational and institutional charity.

Her admirer and spiritual disciple, Ettore Vernazza founded the confraternity of the Oratory of Divine Love and established the first Hospital for Incurables, i.e., specifically for syphilitics, adjacent to Catherine's hospital. He went on to help establish Hospitals for Incurables in Rome and Naples, and confraternities to serve them. The Oratory represented a new type of confraternity dedicated to the urban common good rather than the corporate self-interest of the members. The Oratory's membership and activities were kept secret following Christ's injunction not to give alms for praise. The Genoese Oratory limited membership to 36 laypersons and 4 priests who were specifically charged with maintaining the Hospital for Incurables. Other confraternities imitated the Oratory emphasizing support of hospitals rather than alms given individually and indiscriminately to beggars who were blamed for spreading disease, especially syphilis (Carpaneto da Langosco, 2007).

The Spanish humanist Juan Luis Vives's 1526 *On Assistance to the Poor* built on these initiatives to compose the blueprint for health-care reform throughout Europe.

Expansion of hospitals and their role in disease control was central to Vives's rational plan for confining the contagious and providing work training for poor children to prevent their begging. Throughout the work, Vives blamed vagrant beggars for spreading disease.

Impact and Legacy

The first complete Protestant attack on purgatory came from the English reformer Simon Fish's 1528 *Supplication of Beggars*. According to Fish, purgatory was a fictional scare tactic designed by the Catholic Church to enrich its clergy. With lots of money, free time, and unable to marry, clerics purchased innumerable concubines and prostitutes thereby making them the primary cause of the syphilis epidemic. Fish's accusations should not be ignored as entirely polemical as clerical sexual promiscuity was widely recognized in literature and historical records. Since the medical community tied syphilis to poverty, prostitution, and vagrant beggars, Fish implied that confiscating Church property to aid the poor, and ending the prohibition of marriage for clergy, would halt the syphilis epidemic. A year after Fish's work, Luther finally shut the door between the living and the dead denying any interaction between the two (Fish [n.d](#)).

Meanwhile Catholic reformers who served hospitals adopted doctrines similar to St. Catherine and Vernazza. The three processors brought against Ignatius of Loyola by the Spanish Inquisition while he attended the University of Alcalá reveal connections with lust, disease, and purgatory. In 1526, Loyola arrived in the university town and often taught in hospitals where his audience included former prostitutes who may have been receiving treatment for syphilis. In fact, a former prostitute provided the most damaging testimony against him stating that Loyola claimed to have taken a vow of chastity and could lie in bed with a young woman without committing a sin. For Loyola, focusing on the love of God could strengthen the will to avoid sin, especially lust. Loyola's *Spiritual Exercises* includes considerable meditation on hell, but not purgatory. In fact, the "purgative way" is a positive choice in the first week of exercises, as is the "illuminative way" in the second week (Fita, [1898](#); Loyola, [2000](#)).

In the 1530s, Catholic leaders in Italy like Cardinal Gasparo Contarini tried to find a compromise position on justification. At the 1541 Diet of Regensburg, Contarini succeeded in getting unanimous agreement of Catholic and Protestant representatives to a doctrine of "double justification." The

core of the doctrine was the inextricable nature of love and faith. Christ's crucifixion imputes righteousness to those who have faith in God's promises. This leads to Christian love and charity, i.e., inherent righteousness, through which Christians partake in the divine nature. John Calvin attended the diet and accepted the doctrine, but Luther and Pope Paul III did not. The doctrine was condemned at the first convocation of the Council of Trent, though until final ratifications of all decrees in 1563 the doctrine could have been reopened (Gleason, [1993](#)).

Ultimately, the Council of Trent defined purgatory as a spiritual state in which detained souls could be helped by prayers, and it was to be preached carefully to eliminate any connection to venality and superstitious beliefs. Purgatory shifted from a fearful physical place with a set chronology, to a spiritual state of divine love. In regards to health care, both Catholic and Protestant cities adopted measures similar to Vives's blueprint by building specialized hospitals and using quarantines with secular and religious authorities jointly involved (O'Malley, [2013](#)).

Kabasilas Chamaetos, Nicholas

► [Kavasilas, Nikolaos](#)

Kabasilas, Neilos

Born: 1300

Died: 1363

Michail Mantzanas
Ecclesiastical Academy of Athens, Athens,
Greece

Abstract

Neilos Kabasilas was born in Thessaloniki. He was a supporter of hesychasm, and he was the first to attempt to disprove the Thomistic scholastic theology. He was established as the greatest “polemic” writer, while his treatises on Holy Ghost illustrate his profound knowledge of the clerical tradition and his skills in articulating philosophical syllogisms.

Alternate Names

[Cabasilas, Neilos](#); [Kabasilas, Nicholas](#) (not to be confused with his nephew, also an author and theologian)

Biography

Kabasilas was an ecclesiastical author who was born in Thessaloniki at the end of the thirteenth century (1285) and died around 1363. He was a bishop, and he succeeded Gregory Palamas as archbishop of Thessalonica (1361–1363) and leader of the hesychast movement. Kabasilas was one of Demetrios Cydones’ teachers and one of the great theologians who opposed the alienation of the Orthodox dogma and Greek culture.

He has often been conflated with his nephew, Nicholas Kabasilas, who was also a theologian. Neilos descended from a noble family in Constantinople, studied classical Greek, and became a prominent professor of Greek studies.

During the religious and political crisis which took place in 1341, on a theological level, Kabasilas advocated the hesychast movement, after a period of skepticism toward hesychasm, and supported Ioannis VI Kantakouzenos on a political level. Kabasilas was mentioned in Ioannis VI’s memoirs entitled *Historiai*, as an interlocutor of the emperor in the fictive correspondence presented in the first book. Kabasilas’ theological and philosophical learning was highly respected even by his intellectual opponents, as he was extremely eloquent in the presentation of his philosophical thinking and he had a profound knowledge of patriarchal tradition. Demetrios Cydones commented on Neilos Kabasilas’

erudition stating that *he is inferior to none of those who are perfect in wisdom*.

A staunch advocate of Palamas' ideas, he wrote a famous work related to the session of the council in 1351, which took place at the Monastery of Vlachernai. During this specific session, the council took issue with the views expressed by the theologians Barlaam of Calabria and Gregory Akindynos, who endorsed Western theology, as well as Nikiforos Gregoras against whom Kabasilas wrote the so-called *Antigramma*.

Innovative and Original Aspects

Most of Kabasilas' writings that discuss ecclesiastical matters pertain to the great issues that separated the two Churches. Various sources mention that Kabasilas befriended Barlaam of Calabria. His relation with Barlaam enabled him to become acquainted with Western theological and philosophical thinking. Of particular interest are those of his writings which criticize the Latin tradition, especially those that discuss the reasons behind the disputes within the Church, as well as the supremacy of the Pope, which was considered by Neilos Kabasilas as the reason for both the schism between the two Churches, and the so-called purgatory fire. Kabasilas rejected the Latins' claims that Rome was the only apostolic home and dismissed the Pope's right to summon ecumenical councils: the Pope should not be designated as Peter's successor, and it is the king or the emperor who is allowed to convene an ecumenical council. Furthermore, he examines 49 Latin phrases which he directly contradicts one by one. He also wrote other works which were translated into Latin and Slavic languages. Kabasilas refuted the primacy of Rome by emphasizing the chronological priority of the mother of all Churches – that of Jerusalem – without specifying *de facto* or *de jure* the practical value of this fact. He also stated that Jesus Christ was the first and absolute head of the Church and that ecclesiastical conflicts

should be resolved only by general ecumenical councils.

Neilos Kabasilas' originality lies in the fact that he was the first who opposed to the Byzantine Thomists. More specifically, he sought to refute the following excerpts from the writing of Thomas Aquinas: three articles from the first chapter of the first part of *Summa Theologiae*, eleven chapters of the first and the fourth book of *Summa contra Gentiles*, and the entire second chapter from *De rationibus fidei contra Saracenos, Graecos et Armenos ad Cantorem Antiochenum*. Neilos raised objections to the Latin claim that the essence of God is identified with His energies and supported the view that God's essence is beyond knowledge, while divine energies are the sole way to God. Kabasilas attempted to defend traditional orthodox theology and monastic spirituality, which was founded on the belief that divine essence is inaccessible and cannot be experienced, while divine energies are reachable and thus potentially communicable. He sought to elucidate the distinction between revealed knowledge and human knowledge, as this problem had not been discussed extensively in patristic literature. According to Thomas Aquinas, human intellect and divine revelation are the same, in the sense that they both emanate from the same source – God. This was a bond that was not ruptured in spite of the original sin, as the "image" (*kat' eikona*), which is intellect and free will, remained intact. On the other hand, Kabasilas contends that the original sin obliterated man's natural resemblance to the Creator and deformed the essence of the meaning of "image." This is the reason why intellect is a human feature and it is not related to God who expelled man from paradise. Kabasilas utilized the teachings of Basil the Great and Ioannis Chrysostomus in order to point out that faith and syllogisms are not compatible. With regard to the origin of the Holy Spirit, he notes that Aquinas did take into consideration neither the definitions of ecumenical councils nor the texts of the Scriptures; instead, he developed arbitrary and unfounded

reasoning, stating that the Holy Spirit appears as love and the Son as intellect. Therefore, the Holy Spirit emanates from the Son (*filioque*), in the same way that love emanates from intellect, as what is loved is first conceived by intelligence. Kabasilas' aim was to disprove Thomas Aquinas' scholastic line of thinking, which extrapolated dogmatic truths through reflection. Kabasilas opposed Latins' position that reason and love were considered as emerging from Son's birth rather than as a projection of the Spirit, as these distorted views were dissenting from the content of Scriptures. Kabasilas' contribution to hesychasm lies in the analysis of the concept of divine light and, more specifically, in the analysis of the terms "divine nature", common substance of the three hypostases, and "natural idioms". He sought to prove that the teachings of Akindynos, as well as those of his followers, were misunderstood and were incompatible with the Orthodox dogma. Furthermore, he tried to shed light on the issue of the source of the Holy Spirit. Kabasilas' teachings related to the Holy Spirit are based on Holy Scripture, the imparting religious knowledge of the clergy, the definitions of ecumenical councils, as well as Palamas' teachings about the distinction between God's essence and energies. In his work *Peri ekporeuseos tou Agiou pneumatos kata Latinon*, which could be described as a holistic system of theological teaching, he remarkably enlightened and emphasized the fact that the mystery of God cannot be conceived through logical argument, but through experience. Kabasilas' works can be classified into three categories: a) against the Latins, *Apantisis pros Latinous* or *Egcheiridion to isagonizomenis pros Latinous*, *Peri tis Agias Oikoumenikis Synodou*, *Peri tis arhistou Papa*, *Peri kathartiriou Pyros*, and *Logos apodeiknisto tis diastaseos ton Latinon Ekklesias kai imon*; b) in favor of the followers of Palamas, *Logos sintomos pros tin kakos eklamvanomenin fonin para ton airetikon Akindynianon* and *Synodikos tomos kata Barlaam kai Akindynoutou 1351*; and c) speeches, letters, and correspondence with his

nephew Nicholas Kabasilas and Demetrios and Prochoros Cydones.

Impact and Legacy

Neilos Kabasilas exerted influence not only on major intellectuals and theologians of his time, namely, Demetrios Chrysoloras, the orator Nikiforos Houmnos, and lay theologian and nephew of his Nicholas Kabasilas, but also later generations Callistos Angelicoudis, Patriarch George Gennadios-Scholarios, as well as the writer of the proceedings of the Council of Ferrara-Florence Silvestros Syropoulos.

El Camino College, Humanities, Torrance, CA, USA

Abstract

The term Kabbalah commonly refers to a complex of mystical and esoteric doctrines in the Jewish tradition. However, Kabbalah is a multifaceted phenomenon and differs according to the tradition it refers to. Modern scholarship asserts the complexity of Kabbalah because it embraces many multiplicities of history and literature. Furthermore in the Renaissance, a Christian Kabbalah started to be shaped offering different ideological systems, among them also a magical-talismanic model.

Kabbalah and Rupture to the Tradition

Kabbalah, or Cabala from the Hebrew קַבָּלָה, means “that which has been received” (Idel and Ostow 2011, p. 22) or “reception.” Despite its reconnection to a very ancient time in relation to Moses’ teaching, Kabbalah emerged at the end of the twelfth century in Provence, South of France. Kabbalistic production in the Languedoc region was narrow and “theosophies related to details of Jewish liturgy” (Idel and Ostow 2011, p. 27). Indeed it was in Spain where the most significant phase of medieval Kabbalah flourished. A theosophical-theurgical approach developed in Catalonia, in particular in the cities of Gerona and Barcelona. Idel (Idel and Ostow 1998) underlines that these Kabbalists were probably followers of the Provençal Isaac the Blind (1160–1235), who is thought to be in relation to the production of the *Sefer ah-Bahir* and the *Sefer Yezirah* (Book of Creation). In these books, the system of the *sefirot* is theorized. The essence of the *sefirot* (*Keter*, crown, *Binah*, understanding, *Hokham*, wisdom, *Gevurah*, judgment, *Gedulah*, mercy, *Tiferet*, splendor, *Hod*, majesty, *Netzah*, eternity) vary

according to the different Kabbalistic schools. Some Kabbalists consider them divine powers; others God emanations; others channels through which it is possible salvation-redemption-return to the original; others the presence of God into the world. R. Azriel of Gerona (1160–1238) integrated in his theoretical system the Neoplatonic theory of the emanation and mythical elements, and R. Moshe ben Nahman, known as Nahmanides (1197–1270) established his own particular Kabbalistic school. Furthermore, in Castile, many other Kabbalistic writings flourished, among them the important *Sefer ha-Zohar* (Book of splendour). The *Zohar* offers a fourfold exegetical model to approach the Torah. This is what is called PARDES, from the initial of the four layers of interpretation. The first is *peshat*, which in Hebrew means “simple”; it means the literal meaning. The second is *remez*, which in Hebrew means “hint/s”; it refers to an allegorical or allusive meaning. The third is *derash*, which in Hebrew means “inquire” or “seek”; it connects to the *midrashic*, the rabbinic meaning, the inner references to the holy scriptures or verses. The fourth is *Sod*, which in Hebrew means “secret” or “mystery”; it links to an inner and esoteric meaning. This is the theurgical component that characterizes this branch of Kabbalah.

Another approach, named ecstatic or prophetic, evolved in Sicily with the speculations of Abraham Abulafia (ca. 1240–ca. 1291) whose main writings were composed while he was in the Italian peninsula and Sicily. Abulafia elaborated a system of meditation whose focus was the invocation of “divine names” obtained with the endless permutations and combinations of Hebrew letters. He wrote many commentaries, particularly important was those on *The Sefer Yetzirah*, a book that was fundamental for both theosophical and ecstatic Kabbalah.

Idel and Ostow (2011) distinguished three main currents in the Kabbalah. An earlier theosophical-theurgical one, whose focus was the divinity understood as a complex and dynamic system and the impact of human rituals on that. One of his representatives outside Spain was R. Menahem Recanati (1250–1310). An ecstatic-prophetic one, whose attention was directed to individual’s spiritual experiences toward

redemption and prophecy through the power given by the letters of the divine names. Its principal exponent was the above mentioned Abraham Abulafia who had many followers. A later Kabbalah developed in Italy during the Renaissance with strong philosophical components, and it was sometimes associated to Platonism. Renaissance thinkers found in Kabbalistic literature a concurrence with certain aspects of ancient philosophy, and making it a new intellectual trend, and from these some thinkers developed a magical-talismanic movement.

Ecstatic and Theosophical-Theurgical Kabbalah and Astromagical and Talismanic Kabbalah in the Renaissance

In Italy, the dominant model of Kabbalah was the ecstatic, extremely connected to the teachings of Abulafia, and Gikantilla (1248–after 1305) and his followers. The theosophical tradition was mainly developed in Spain, and only few examples can be found in Italy (i.e., R. Menahem Recanati). After the expulsion of the Jews from the Iberian Peninsula (1492), many Kabbalists moved to Italy and to the Ottoman Empire, among them are R. Yitzhaq Mor Hayyim, R. Yehudah Hayyat, R. Joseph ibn Shraga, R. Joseph Alqastiel, R. Abraham ben Eliczer ha-Levi, and R. Yitzahaq ben Hayyim ha-Kehen. R. Yehudah Hayyat’s *Sefer Ma’arekhet ha-’Elohut Minhat Yehudah* is particularly important because it shows the deep differences between Safedian and Italian approaches to Kabbalah (Idel and Ostow 2011). The book is important also because it introduces the *Zohar* to a new readership. “Several types of kabbalah existed in Italy in the generation of the expulsion [from Spain in 1492] operating on different levels and different ways. Whereas Spanish Kabbalah was particularist, antiphilosophical, and conservative, Italian Kabbalah, both Jewish and Christian was much more universalist, more inclined to magic, and subject to interpretation through the use of a variety of philosophical trends” (Idel and Ostow 2011, p. 218). Therefore, it occurred that the Safedian Kabbalah interested a great number of

intellectuals, who were mostly Christians, because the affinity with Platonism, and ancient hermetic philosophy. Christian readers were eager to read more, and they were looking for Latin translations, and recruited Jewish scholars to teach them Hebrew and to help them to understand the hidden meaning of the holy writings. Many Jewish intellectuals acted as intermediaries. A separation between different models of Kabbalah never occurred. Indeed many forms of Judaism contain magical motifs. “Jewish magic in the first stages of Jewish mysticism, the Heikhalot literature and its reverberations, including its repercussions in southern Italy from the tenth to twelfth century, and in Ashkenazi esoteric literatures emphasized mainly the linguistic aspects of magic, namely letters, names, seals, prayers, and incantations” (Idel and Ostow 2011, p. 269). Furthermore, there was a great influence of the Greek thought and culture into Jewish thinkers, especially regarding Hermetic texts. This was the case of R. Abraham ibn Ezra (1089–1167) and R. Yehudah ha-Levi (1075–1141), and some Spanish Jewish authors, who followed them, were interested in astral magic. A book that was influential for astromagical aspect was Ibn Zarza’s *Meqor Hayyim*, written by a fourteenth century Jewish author from Castile. This book was then published in Mantua in 1559. This book was read by Alemanno and by many thinkers of Ficino’s group. As remarked by Idel and Ostow (2011) “magical literature of both Arabic and Jewish extraction, linguistic, alchemical, and astromagical, entered into strong interactions that produced the Florentine Jewish and Christian synthetic systems in the late fifteenth century, with the eclectic mode becoming more and more pronounced in the sixteenth-century occultist writing in Europe” (p. 286).

Philosophical and Christian Kabbalah in the Renaissance

Yohanan Alemanno (1435–1504) was an important intellectual figure and had a strong influence

on Giovanni Pico della Mirandola’s thought. He was born in Mantua, but lived best part of his life in Florence. Many of his works arrived to us in manuscript form, among them a commentary of the “Song of Songs” *Hesheq Shelomoh* (Solomon’s Desire), a treatise *Hay ha-‘Olamim* (*The Immortal*), a commentary on the Genesis *‘Ene ha-‘Edah*, and an autograph notebook (*Liqqutim*) containing his Kabbalistic sources.

R. Elijah Hayyim ben Benjamin of Genazzano was another later fifteenth century Italian Kabbalist who wanted to connect Kabbalah to other traditions, and aligned it to Zorostranism and Pythagoreanism.

Leone Ebreo, Yehudah Abravanel (1463–before 1530) was considered a Kabbalist by Joannes Pistorius. Indeed, the *Dialoghi D’Amore* Latin translation made by Joannes Carolus Saracenus (1564) is located into Pistorius’ collections of treatises on Kabbalah.

In the Renaissance, Kabbalah attracted the attention of many Christian intellectuals, which started collecting and studying Kabbalistic texts. Pioneers of Christian Kabbalah were Arnould of Villanova (1240–1311) and Ramon Llull (1232–1315).

Ludovico Lazzarelli (1447–1500) deals with some Kabbalistic material in his *Crater Hermetis* written in the early 1490 but published in 1505 in *Pimander Mercurii Trismegisti liber de sapientia et potestate Dei. Asclepius eiusdem Mercurii liber de voluntate divina. Item Crater Hermetis a Lazarelo Septempedano*. Lazzarelli searched in some commentaries of the *Sefer Yetzirah* the secret magic formulas of the Hebrew combination of letters of the Tetragrammaton in relation to the Golem.

Johann Reuchlin (1455–1522), whose sources were mainly Recanati and Gikantilla, wrote *De verbo mirifico* (1494) and *De arte cabalistica* (1516).

Giovanni Pico della Mirandola (1463–1464) studied Kabbalistic texts assisted by different Jewish teachers, among them Samuel ben Nissim Abulfaraj, Yohanan Alemanno, and Raymond Moncada, known as Flavius Mithridates, a Jew converted to Christianity. Pico’s Kabbalistic

speculations can be found in his *Nine Hundreds Theses* (published in 1486), in its *Oration On Man's Dignity* (1486) and *Heptaplus* (1489) that was a commentary on the first 26 verses of the Genesis. Ogren (2015) observed that also Nahmanides' works are important as a background for Pico's studies on Kabbalah.

Petrus Galatinus (or Pietro Colonna Galatino) (ca.1460–ca.1540) wrote his *De Arcanis catholicae veritatis: contra obstinatissimum Judaeorum nostrae tempestatis perfidiam* (1518) in twelve volumes, where it is possible to find passages from the *Zohar*.

Francesco Zorzi or Giorgi (1466–1540) was a Venetian Franciscan friar, and author of the work *De harmonia mundi totius* (published 1525). He was born to a noble Venetian family, and although he became a Franciscan, he continued for the rest of his life to be in contact with the political elites of Venice, from whom he was always respected and admired despite of his not orthodox position. Giorgi was truly interested in the Kabbalah. He believed, as well as Pico, that Kabbalah encapsulate deeper truths that proved the veracity of Christianity. He believed that the knowledge of the Holy language, Hebrew, was supreme, and he became proficient in that language, together with Latin, and Greek. Giorgi also published the (pseudo-)Aristotelian work *Problemata* in 1536 where many references are from the book of the *Zohar*.

Giles of Viterbo (1469–1535) collected many Hebrew texts in his library in Rome. He wrote two Kabbalistic works, *Libellus de litteris hebraicis* (Book on the Hebrew Letters) and *Scechina*. His *Libellus de litteris hebraicis* was influenced by the *Sefer ha-Temurah* (book of figures of the Hebrew letters), which comes from Gerona's school. In the *Scechina*, Giles reads the Kabbalah in a total revealing mode, where the "Schekinah" is understood as the ground where the Divine Law is brought into actuality.

Agostino Giustiniani (1470–1536) was a noble from Genua, a scholar in Greek and Hebrew, he wrote *Psalterium hebraeum, graecum, arabicum, et chaldeum, cum thribus Latinis interpretationibus et glossis* (*The Psalter of*

Hebrew, Greek, Arabic, and Chaldean, with three Latin interpretations and glosses) where there are some original Hebrew texts and their translation into Latin from the works of R. Isaac ibn Avi Salulah and Abulafia.

Heinrich Cornelius Agrippa (1486 ca–1535) wrote in three books the *De Occulta Philosophia* (*Three books of Occult Philosophy*), where Kabbalah is exposed in book 3. Agrippa's focus is placed in Kabbalah's esoteric powers.

Phillipus Theophrastus Aureolus Bombastus von Hohenheim, known as Paracelsus (1493–1541) with his *Alchemical Writings*, relates Kabbalah to astrological and magical practices.

Paul Riccius (1506–1541) wrote *De Coelesti Agricultura* and *Pauli Ricii in cabalistorum eurditionem isagoge*, Augsburg 1515.

Jean Thénau (ca 1480–1542) wrote *La sainte et tres cretienne cabala* (*The Holy and Very Christian Kabbalah*) and the *Traité de la cabale* (*Treatise on the Kabbalah*, 1521) that are surveys of the main studies about Kabbalah by Pico, Reichlin, Agrippa, Ricci, and Giorgi.

Giulio Camillo (1480–1544) discloses his hermetic-Kabbalistic tradition in *L'idea del teatro* (1550), famous as *Memory Theatre*.

Guillame Postel (1510–181) translated into Latin the *Sefer Yetzirah*, the *Bahir* and part of the *Bereshit Rabbah* (a commentary of the Book of Genesis).

Jean Bodin (1530–1596) wrote the *Colloquium heptaplomeres de rerum sublimium arcanis abditis* (1588) where many Jewish authorities and the *Zohar* are considered.

Johannes Pistorious (1546–1608) wrote his *Artes Cabalisticæ* (1587).

Many Christian thinkers, like Zorzi and Giles of Viterbo, searched also from the New Easter Jewish material, which lead them to elaborate their thought. Indeed, Safed (today in Israel) offered the majority of contribution in Kabbalist production after 1530. "Between approximately 1530 and 1590 the kabbalists of Safed developed a theological world view and a religious way of life that were highly distinctive, even while they appropriated much of earlier Kabbalah. At the

center of this a new religious outlook was a synthesis between mysticism and messianic aspirations” (Holtz 1984, p. 342). Important representatives of the kabbalists of Safed were Moses ben Jacob Cordovero (1522–1570) with his writings *Pardes Rimmonim*, *Elimah Rabbati*, and many commentaries on the *Zohar*. R. Isaac Luria (1534–1572), considered by scholars as the father of contemporary Kabbalah, elaborated a system named “Lurianic Kabbalah” from a huge portion of the book of the *Zohar*. Another Kabbalist who belonged to that group was Elijah de Vida (1518–1592). The book of the *Zohar* was published in Mantua in 1558.

Studies and Scholars on Renaissance Kabbalah

In addition to the classic studies of Gershom Scholem (1897–1982), François Secret (1911–2003), Joseph Dan (1935), and Moshe Idel (1947), here is a list of important scholars who studied Renaissance Kabbalah: Joseph Leon Blau (1909–1986) who wrote *Christian Interpretation of the Cabala in the Renaissance* (1944); Frances Amelia Yates (1899–1981) with her *Occult Philosophy in the Elizabethan Age* (1979), *Giordano Bruno and the Hermetic Tradition* (1964), *The Art of Memory* (1966), *Theatre of the World* (1969), *The Rosicrucian Enlightenment* (1972); Daniel Pickering Walker (1914–1985) with his *Spiritual and Demonic Magic: From Ficino to Campanella* (1958), *The Ancient Theology: Studies in Christian Platonism from Fifteen to Eighteenth Century* (1972); Philip Beithman *Alchemy of the World: Cabala of the Renaissance* (1998); Brian Ogren, *Renaissance and Rebirth*.

Kadıẓâde

Born: 1582, Balıkesir

Died: 1635, Istanbul

Marinos Sariyannis

Institute for Mediterranean Studies/FORTH
 (Foundation for Research and Technology – Hellas), Rethymno, Greece

Abstract

Kadıẓâde Mehmed Efendi, son of Mustafa (Balıkesir 1582–Istanbul 1635), was a highly influential Ottoman preacher whose revivalist ideas initiated a strong movement named after him, the Kadıẓadeli; he advocated the abolishment of innovations, especially those favored by dervish orders, and the return to the precepts of the Islamic Holy Law.

Biography

Son of a provincial judge, Kadıẓade Mehmed Efendi took his first training in his native town, Balıkesir, before moving to the Ottoman capital, Istanbul, where he became a mosque preacher. Initially, he was under the influence of a sheikh of the Halveti order of dervishes; however, he then reverted to an austere fundamentalist attitude. He served as a preacher in various mosques, beginning from the early 1620s, and his career culminated in 1631, after his appointment as the preacher of the imperial mosque of Ayasofya (St. Sophia). In his highly popular and eloquent sermons, he attacked vehemently the dervish practices and confronted in particular with the

Halveti sheikh Abdülmecid Sivasî Efendi (1563–1639). Apart from oral sermons, he was the author of several treatises in Ottoman Turkish and Arabic. His teachings drew a lot of supporters and influenced Sultan Murad IV's harsh policies. Kadızade even joined Murad's campaign against Iran in 1635; however, he fell ill and had to return to the capital, where he died a little later.

Heritage and Rupture with the Tradition

Kadızade's ideas influenced deeply Ottoman politics throughout the seventeenth century. They have often been characterized as “fundamentalist” or “revivalist,” as they emphasized the need for a moral and social redressing of the Ottoman Empire through a return to what he considered strictly Islamic values and the abolition of as many innovating aspects of everyday life as possible. Indeed, the main characteristics of Kadızade's ideology were the opposition to any innovation (*bid'at*), as opposed to the way of life in the time of Prophet Muhammad, and especially the violent struggle against the dervish brotherhoods and more specifically, the Halvetis. His forerunner was Birgivî Mehmed b. Pir Ali (1523–1573), an eminent theologian who had reacted against Ebussuud's interpretation of the *Sharia* and whose books were widely read by both the people and the ulema. Birgivî had written two highly influential treatises in the form of catechism brochures, stressing among others the dangers of innovation (*bid'at*) from pious foundations based on cash to the dancing ceremonies of the Sufis and the payment of religious functionaries. In a wider context, both Birgivî and Kadızade may be viewed as influenced by medieval Salafist philosophy (itself the precursor of nineteenth-century Wahhabism), notably Ibn Hanbal (d. 855) and Ibn Taymiyyah (d. 1328), who stressed the need for unity of belief among the faithful and attacked what they considered pantheistic and extremist doctrines of most Sufis. Like the Salafists, moreover, Kadızade tended to understand the Koranic verses literally, denying any altering of their content by logical interpretation.

Innovative and Original Aspects

Kadızade turned Birgivî's teachings into an activist movement, the Kadızadeli (meaning Kadızade's followers), a movement which dominated the political and ideological scene of the Ottoman Empire throughout the seventeenth century. Activism was justified due to the old Islamic obligation for “commanding right and forbidding wrong” (*emr-i ma'rûf ve nehy-i münker*), i.e., the obligation of a believer to impose righteous behavior and to act against impious practices. While the application of this duty is generally considered as incumbent upon the ruler, Birgivî had extended it to every Muslim, and his followers tended to consider themselves entitled to practice this obligation even by force. Kadızade himself was more of a preacher and advisor than an activist leader, but his successors in the following decades did launch anti-dervish pogroms and took an active part to the political turmoil of the era.

Moreover, Kadızade and his disciples adopted a much more uncompromising stance against innovations, taking them literally to be every practice that did not exist in the time of the prophets. A negative attitude against innovation (*bid'at*) is inherent in Islamic thought, but then the concept of “good innovation” (such as the building of minarets or the compilation of books, for instance) had been developed, and the traditional view rejected only innovations in matters of belief and worship. What constituted such an innovation, however, could still be a matter of dispute, and Kadızade tended to expand the field of “bad innovation” as much as he could. Not all the issues he brought under dispute were unprecedented in Islamic history, and some were already discussed by Birgivî; however, their grouping as a set of “evil innovations” which had to be fought against seems to have been a policy initiated by Kadızade in his struggle against the Halveti dervishes and especially against Sivasî Efendi. A first group of these issues, indeed, was related to dervishes, condemning their religious practices and especially their use of music and dance. A second group had to do with social life, from the use of coffee and tobacco to the practice of shaking hands or bowing, while quite a few of issues were related to various religious beliefs and

issues, such as visiting tombs of dervishes or saints (a practice Kadıẓade and his followers condemned), or whether the Pharaoh or the Prophet's parents died in Allah's faith and so forth.

Kadıẓade was also known to despise philosophy and logicians in favor of canonical jurisprudence and Koranic commentary. He stressed the importance of catechism and religious sciences, arguing that "all other sciences are like medicine which should be taken only when necessary" (Çavuşoğlu, 272). One of the issues in dispute between the Kadıẓadelis and their opponents concerned Shaikh Mühıyiddin Ibn Arabi (1165–1240) and his theory on the "unity of being" (*vahdetü'l-vücûd*), i.e., the belief that all things existent share the same essence, being all part of a varied yet congruent totality that reflects God's existence, the latter being the only true reality. Although he does not name Ibn Arabi, Kadıẓade explicitly attacks his theory: he argues that it would mean that canonical lawfulness or divine punishment is just an imagination and that it blurs the borders between worshipped and worshipper, creator and creature. On the contrary, he states, the existence of the creation is real and from it God's existence may be inferred.

Impact and Legacy

Murad IV did not adopt the Kadıẓadeli program against the Sufis and had close relations with Sivasî as well; however, it seems that he used Kadıẓade's ideas and popularity in order to promote his own measures for public order and enhancement of the state power. The ban on tobacco and the closing down of coffeehouses by Murad were, at least in theory, based on these ideas. A second Kadıẓadeli wave, which seems to have been the most popular and massive one, appeared under the leadership of Üstüvanî Mehmed (d. 1661). In the turmoil of the years after the deposition of İbrahim and during the first years of Mehmed IV's reign, the Kadıẓadelis attracted large masses of the Istanbul populace, targeting what they perceived as the corruption of society and the state due to irreligious innovations and especially the dervish orders, mainly the

Halvetis, until the suppression of the movement by the grand vizier Mehmed Köprülü in 1656.

Finally, during the grand vizierates of Mehmed Köprülü's son Fazıl Ahmed (1661–1676) and his successors, the Kadıẓadeli movement had its third major wave of influence under the preacher Mehmed b. Bistam Vanî Mehmed (d. 1685). Here again, as in Murad IV's time, the influence of the movement was a result of its leader's personal relations rather than mass participation. Vanî Efendi was very close to Fazıl Ahmed and his successors and succeeded in implementing part of the Kadıẓadeli program. He managed to ban taverns and dervish congregations, while in 1666 the ban came to include the ritual dances (*sema*) of the dervishes and especially the Mevlevîs. It seems that this time, fundamentalist ideas influenced more deeply the state apparatus; the "classical" Ottoman legal synthesis, which balanced holy and secular law, tilted toward the former, while regulations based on customary law were abolished. However, after the failure of the Vienna campaign (1683), which had been incited by him, Vanî Efendi was exiled and the "fundamentalist" movement waned away. Nonetheless, various reforms instituted later on continued to be legitimized in terms of a return to the foundations of the holy law, while individual Kadıẓadelis were still mentioned in the Ottoman provinces well into the eighteenth century.

The Kadıẓadeli movement played a predominant role in the shaping of Ottoman ideas and policies throughout the seventeenth and well into the eighteenth century. Traditionally seen as a "fundamentalist" versus Sufism conflict, it has recently been the object of several studies, focusing on the fluidity of this distinction, the social and political context of the conflict, or the role that career opportunities for preachers and dervishes played in its development. At any rate, its influence was evident to various measures and reforms effectuated from the late seventeenth century onward in what has been viewed as a gradual abandonment of the Ottoman state law statutes (*kanun*) in favor of a more rigid compliance to the Islamic legal precepts (*seriat*), especially in landholding and tax law, but also in penal issues or the regulation of prices; the incentives for these reforms have been the object of scholarly debate,

but it is sure that their justification leaned heavily on the Kadızadeli ideas.

Kara, Avigdor

Born: Unknown

Died: 1439, Prague

Tamás Visi
Kurt and Ursula Schubert Centre for Jewish Studies, Univerzita Palackého v Olomouci (Palacky University), Olomouc, Czech Republic

Abstract

Avigdor ben Yitzhak Kara (?–1439, Prague) was an important rabbi, mystic, poet, and philosopher in Prague during the last decades of

the fourteenth and the first decades of the fifteenth centuries. Since philosophy and Kabbalah arose almost no interest among Ashkenazi Jews during the Middle Ages, the interest Kara took in these subjects was exceptional though not unparalleled: Kara belonged to a small circle of philosophers in late fourteenth- and early fifteenth-century Prague. Avigdor Kara together with other members of that circle (Yom-Tov Lipmann-Mühlhausen, Menahem Shalem) can be considered a forerunner of the sixteenth- and seventeenth-century Jewish renaissance of Prague.

Biography

Avigdor Kara passed away in Prague on 25 April 1439 according to the inscription on his tomb in the old cemetery of Prague (Muneles 1988). His birthplace and date is not known; he was probably born in the 1360s. His family may have migrated to Prague from the region of Erfurt; in one of his works, he relates an oral tradition about the persecutions following upon the Black Death of 1348/1349 that took place in Erfurt and its vicinity. In 1389 he witnessed a massacre of Jews in Prague and wrote a famous elegy about it in Hebrew, which is recited in liturgical commemoration of that event in Prague until today. In 1409 he spent some time in Regensburg and wrote a mystical commentary on Psalm 150 there. In 1413 he was a member of the rabbinic court of justice of Prague together with Menahem Shalem and Yom-Tov Lipmann Mühlhausen (Seibt and Tischler 1995). Some Latin documents from Prague dated to the 1420s and 1430s refer to Avigdor Kara as *magister Victor* (Muneles 1988).

He sometimes refers to Menahem Shalem as "my brother." However, this phrase is not to be taken literally, the two had different fathers and there is no reason to believe that they were related in any way. A fifteenth-century chronicle claims that Avigdor Kara secretly taught the Czech king Wenceslaus IV the principles of Judaism, and John Hus' teachings were also influenced by Kara (Yuval 1989). These claims are entirely baseless. There is no palpable connection between

Avigdor Kara on the one hand and John Hus and his followers on the other hand. A German literary text entitled *Der Ackermann aus Böhmen* composed in Bohemia around 1400 contains an enigmatic dedication to a certain “Victor the Jew” (*victori judeo*). It is possible that Avigdor Kara was meant, although it is far from being certain (Hausmann 2003).

Works

Avigdor Kara's extant works include Hebrew poems, such as the aforementioned elegy on the massacre in Prague, 1389, a poetic resume of Jewish faith on the basis of Moses Maimonides's (1138–1204) 13 articles of faith (this poem circulated in Yiddish translation as well), and few more liturgical compositions. He wrote a long mystical explanation of Psalm 150, a collection of responses to theological and philosophical questions, and a treatise on Hebrew grammar entitled *Midbar sin*. Some fragments about interpreting several biblical verses also survive in manuscripts. A writing in which he reconciled philosophy and Kabbalah is no longer extant. Contrary to the assumption of some scholars from the previous century, the kabbalistic work *Sefer hapliah* was not authored by Kara but by a Byzantine Jew (Ta-Shma 2005). Most of Kara's exegetical, mystical, and philosophical works have not been edited yet (but cf. Hershkovitz 2007).

Legacy

Kara was one of the first known Jewish intellectual in Central Europe who experimented with philosophical and kabbalistic ideas (Kupfer 1972). In his days Prague became the first veritable center of philosophical studies among Ashkenazi Jewish communities (Visi 2009). A disputed question among scholars belonging to the Prague circle was the relationship between philosophy and Kabbalah: Avigdor Kara, just as Yom-Tov Lipmann Mühlhausen, believed that Kabbalah and philosophy harmonized in all essential points,

whereas for Menahem Shalem, they were diametrically opposed intellectual traditions. By disseminating philosophical and kabbalistic ideas, Kara prepared the way for early modern Jewish intellectuals who were to write more extensively on philosophical, theological, mystical, and scientific topics in late sixteenth- and early seventeenth-century Prague.

Kâtib Çelebi

Born: February 1609

Died: 6 October 1657

Marinos Sariyannis

Institute for Mediterranean Studies/FORTH
(Foundation for Research and Technology –
Hellas), Rethymno, Greece

Abstract

Mustafa son of Abdullah, known as Kâtib Çelebi or Hacı Halife (Hajji Kalfa) (Istanbul, 1609–Istanbul, 6 October 1657), was an Ottoman encyclopaedist, historian, and geographer who is generally credited with the introduction of European-style scientific geography and more generally with a major attempt to rationalize Ottoman science and world view.

Alternate Names

[Hacı Halife](#); [Hajji Kalfa](#)

Biography

Son of a high-rank financial scribe and soldier, Kâtib Çelebi became his father's apprentice and accompanied him in a series of imperial campaigns to the East from 1624 onwards. After his father's death, he returned to Istanbul and took courses under Kadızade Mehmed Efendi (q.v.), whose legalist and literal reading of the Koran impressed Kâtib Çelebi without making him adhere to his revivalist ideas. While studying, he took part to three more campaigns, all against Iran; from 1635 he settled permanently in

Istanbul and continued with his studies with various teachers, making himself a well-trained scholar in most topics of the *medrese* (i.e., the jurisprudence school) curriculum, including astronomy, mathematics, and languages (his own books are written in both Ottoman Turkish and Arabic, and he used sources in Persian as well). Meanwhile he continued working in the imperial chancery, hence his proonym (Kâtib Çelebi, the “Master Scribe,” or Hacı Halife [the Hajji Kalfa of Western sources], “the Pilgrim Clerk”), while at the same time spending his mother's considerable inheritance in buying books. By 1642 he had started giving lessons himself, and he was acquainted with both the intellectual elite of Istanbul and Western scholars residing in the Istanbul embassies. He died peacefully in 1657.

A prolific writer, Kâtib Çelebi was one of the first Ottoman scholars to have used Western sources: he had European renegades translate for him various chronicles and geographies, which he then annotated and published, or else used for his own works. Among his works, one should note: *Keşfü'z-zünûn 'an esâmî'l-kütûb ve'l-fünûn* (“Discovery of the opinions by the names of books and sciences”), an alphabetical bibliographical dictionary in Arabic which is still appreciated as a reference, especially in regard with works that are not extant; *Takvîmü't-tevârih* (“Chronicle of histories”), a series of chronological tables of world history; *Fezleke-i tevârih* (“Summary of histories”), an Ottoman history covering the years 1592–1654; *Cihânnümâ* (“Mirror of the world”), an ambitious effort of universal geography, begun twice, the second time with extensive use of European geographical works translated for him by a French renegade; *Düstûrü'l-'amel li-islâhi'l-halel* (“Course of measures to redress the situation”), a reworking of a memorandum Kâtib Çelebi wrote for a meeting studying the fiscal crisis in 1653, where he summarizes his views on society and political reform; and *Mîzânü'l-hakk fi ihtiyâri'l-ahakk* (“The balance of truth for selecting the right path”), a treatise on the various points of dispute between Kadızade (q.v.) and Sivasî Efendi as for the abolishment of

various “innovations,” containing also an autobiographical note. Moreover, with the help of his convert friends, Kâtib Çelebi prepared a series of translations of European works, mainly from Latin, among them *Atlas Minor* (a redaction of Gerard Mercator’s *Atlas Major*) and chronicles of Byzantine and European history.

Heritage and Rupture with the Tradition

One of the major aspects of Kâtib Çelebi’s work is his impressively extensive knowledge of a vast array of the previous Islamic scientific literature. A bibliophile and polymath, he had assembled what in his lifetime may have been the largest private library in Istanbul, and his bibliographical compendium contains summaries of more than 14,000 books in Arabic, Persian, and Ottoman Turkish, while its introduction is a classification of sciences based on Taşköprüzade’s (q.v.) and Ibn Khaldun’s works.

Moreover, in an age where “rational sciences” (e.g., logic or mathematics) had already started to decline in favor of “transmitted” ones (i.e., theology, grammar, and law) in the *medrese* curriculum, Kâtib Çelebi emphasized the need and utility of natural sciences, with an emphasis to geography and astronomy. In the introduction of his polemical work against the Kadızadeli revivalists, *Mizânü’l-hakk*, Kâtib Çelebi advocates the value of the rational sciences, which pertain to matter, either only from the external reality, like mathematics, or both from external reality and from the intellect, like natural science. However, one must not overestimate Kâtib Çelebi’s rationalism: he surely was a product of his tradition, entrenched in the transmitted way of thinking inasmuch he was prone to relate unquestionably traditions or practices that would nowadays sound quite irrational. The innovation brought about by Kâtib Çelebi was a quest for unambiguity and a widening of the sources used, upon which the traditional textual critique tools are applied. The translations of the *Atlas Minor* and of similar Western European texts

served as an enlargement of the tradition, an enrichment with a new source and, all the more so, a more authoritative one.

Innovative and Original Aspects

Kâtib Çelebi was not the first Ottoman scholar to use Western sources; almost simultaneously with him, the historian İbrahim Peçuyulu (Peçevi, d. 1650) had made use of historical sources in Western languages, while a history of France or an account of the discovery of America had been translated in the late sixteenth century. However, Kâtib Çelebi was the first to have sought in so systematic a way a deep acquaintance with European science, especially history and geography. Apart from his translations and adaptations, he stressed in various works the need for an unprejudiced approach to European science and for the application of scientific and rational methods, e.g., in navigation.

In the field of political philosophy, Kâtib Çelebi may be credited with the first solid introduction of Ibn Khaldun’s philosophy of history in Ottoman letters; this is done in both *Düstûrü’l-‘amel li-islâhi’l-halel* and the introduction to his chronological tables, *Takvîmü’l-tevârîh*. First of all, he uses a definition of his own for the term *devlet* (Ar. *dawla*), which for Ibn Khaldun meant “dynasty” but which Kâtib Çelebi takes for the human society as a whole. Then he argues that the social condition of man resembles the individual. An individual’s life is naturally divided into three stages, namely, growth, standstill, and physical decline; the coming of each age, in its turn, depends on the disposition of the individual, so that a strong man comes to his old age later than a weak one. Similarly, now, runs the social state of man, i.e., society. Thus, Kâtib Çelebi reduces Ibn Khaldun’s five stages to three while maintaining the usual time span of a society (or dynasty in Ibn Khaldun’s original) as three generations or 120 years. He stresses that those officials who try to mend such problems of the decline in the same way they would do it in the

standstill or middle period are bound to fail, since each period requires its own measures. However, God is all-powerful and may allow its surpassing. For one thing, a dynasty that forgets its just laws and turns to tyranny will fall to decline earlier than the usual time span (just like a sick man that takes poison instead of medicine), and a dynasty that takes wise measures and uses insightful statesmen as doctors can extend its days, the same as an old man can live till the end of his days in good health.

Kâtib Çelebi takes further the simile of society with the human body, drawing on the Galenic medicine and earlier Persian tradition. According to his analysis, society is constituted by four “pillars,” namely, the ulema (jurists), the military, the merchants, and the peasants, which correspond to the four humors of the human body (blood, phlegm, yellow, and black bile – note that his Persian and Ottoman predecessors would rather speak of the four elements, namely, fire, air, water, and earth). Just as the four humors must be kept in equilibrium, with none exceeding its defined limits in the expense of the others, so must these four social classes profit from each other and coexist in moderation and temperance.

His solid political propositions differ from previous Ottoman efforts in that he does not argue for a total return to the institutions of an idealized “Golden Age” (usually localized in the first half of the sixteenth century), but rather advocates a gradual decrease in the number of soldiers under the leadership of a strong vizier, a “man of the sword.” In other parts of his work, Kâtib Çelebi adopts a balanced stance against political and ideological fractions, arguing that what a wise man should do is to get to know the beliefs and tenets of every class of people in every country, rather to try to impose his own. He declares straightforwardly that there is no point in trying to abolish innovations, even bad ones, once established in a community. What is necessary for the rulers is only to protect the order of the Muslim people and the principles of Islam among the community, but not to force people to comply.

Impact and Legacy

Kâtib Çelebi seems to have enjoyed a reputation of a polymath during his lifetime, and he was acquainted personally with Hüseyin Hezârfen (1600–1678/1679), who may be said to have succeeded him in both his wide array of interests and the friendly relations with European scholars of Istanbul. His works continued to be read long after his death: the historian Mustafa Nâ'imâ (ca. 1665–1716) copied large sections of Kâtib Çelebi's chronicle in his own history of the Ottoman Empire (including its pathbreaking introduction, where he used and expanded Kâtib Çelebi's Ibn Khaldunist theories), while his geographical material passed on (through the geographer Ebû Bekr Behrâm al-Dimişkî, d. 1691) to İbrahim Müteferrika (ca. 1674–1745), the founder of the first Ottoman printing house, who supplied the second version of Kâtib Çelebi's *Cihânnümâ* with maps and published it in 1732.

Kavasilas, Nikolaos

Born: 1319–1323, Thessalonica

Died: 1397–1399, Constantinople

Athanasia Theodoropoulou

Department of Philosophy, School of Philosophy,
National and Kapodistrian University of Athens,
Athens, Greece

Abstract

Nikolaos Kavasilas was a notable lay theologian of the Greek Orthodox Church. He is regarded as one of the most profound Byzantine theologians of the fourteenth century and one of the foremost Marian theologians in the Greek patristic tradition. He was an original exponent of anthropocentric Mariology and Christocentric theology. A prolific author renowned for his liturgical and sacramental writings, but also concerned with social and political issues. He lived in a period of political strife and theological controversy. He was a younger contemporary of Gregorios Palamas, a close friend of Demetrius Cydones and an advisor to the Emperor John VI Cantacuzenus.

Alternate Names

Kabasilas, Nikolaos; Cabasilas, Nikolaus;
Cabasilas, Nicolas; Cabasilas, Nicholas;
Kabasilas Chamaetos, Nicholas

Biography

Nikolaos Kavasilas was born in Thessalonica into a noble Byzantine family. His full name was Nikolaos Kavasilas Chamaetos and occurs in many manuscripts, albeit he adopted his mother's noble family name of Kavasilas, well-known in the intellectual and ecclesiastical life of Thessalonica, in preference to his father's family name of Chamaetos. Kavasilas' exact date of birth is unknown. Older sources place his birth

in 1300 or even earlier. Nowadays, it is commonly accepted that he was born between 1319 and 1323. In addition, 1322 has often been suggested as the most probable year of his birth, based on the fact that in a letter addressed to the Empress Anna Palaiologina, also known under the name Anna of Savoy, around 1351/1352 Kavasilas admitted that he had not yet reached the age of 30.

Kavasilas received his early education in Thessalonica. His teacher was his uncle from his mother's side, Neilos Kavasilas, a distinguished scholar, one of the most active Palamites, and the future Archbishop of Thessalonica (1361). Nikolaos Kavasilas was also given spiritual guidance by the future ecumenical Patriarch Isidore Boucheiras (1347–1350) who was directing the hesychastic circles of Thessalonica. In these circles Kavasilas first met Saint Gregorios Palamas (1296–1359), the leader of the fourteenth century movement of Hesychasm (a form of monastic asceticism popular on Mount Athos that introduced a particular psychosomatic method of prayer through which the deification is achieved). Kavasilas continued his training in Constantinople, probably from 1335 to 1340, where he studied classical Greek literature, rhetoric, philosophy, theology, mathematics, astronomy, and law.

When Kavasilas returned to Thessalonica in 1341/1342, he found himself in the midst of the Byzantine civil war between the Cantacuzenes and the Paleologans (1341–1347). As evidenced by his personal correspondence, Kavasilas was a devoted adherent and a close friend of the Emperor John VI Cantacuzenus; hence in the rivalry between the emperors John V Palaeologus and John VI Cantacuzenus, Kavasilas sided with the last one, and he engaged in several diplomatic missions. Indeed, in the period 1345–1354, Kavasilas served as advisor to the Emperor John VI Cantacuzenus. Several writings of Kavasilas, mainly eulogies and his correspondence, as well as his treatises on various issues related to Byzantine society, date from that period (see below for details). In 1345 Kavasilas was one of the two ambassadors sent by the city of Thessalonica to negotiate with

Manuel Cantacuzenus, the governor of Veroia and the future Despot of Morea (1349–1380). In 1347 he accompanied the newly ordained Bishop of Thessalonica Gregorios Palamas to Thessalonica. When the Zealots (a group of anti-aristocratic revolutionaries who established a regime in Thessalonica during 1342–1349) did not allow Palamas to enter the city, both Palamas and Kavasilas went to Mount Athos where they stayed for 1 year. In 1349 Kavasilas and his close friend Demetrius Cydones were planning to accompany the Emperor John VI Cantacuzenus to a monastery, where the last one wanted to become a monk. For unknown reasons, that plan did not materialize. In spite of being a layman, Kavasilas was among the candidates for the new Patriarch of Constantinople in 1353, but he was not elected. In February 1354 he delivered the ceremonial oration at the coronation of Matthew Cantacuzenus, and probably at the same year, he wrote a eulogy for the Empress Anna Palaiologina. Later that year, in December 1354, John VI Cantacuzenus was forced to abdicate, and then he retired to the monastery of Saint George in Mangana, where he finally embraced the monastic life under the name Joasaph. Because of Cantacuzenus' abdication, Kavasilas' political life, which had lasted almost a decade, came to an end, and presumably at the age of 32, he withdrew from public life. Kavasilas spent the rest of his life working on his most influential theological treatises: *The Life in Christ*, *Commentary on the Divine Liturgy*, and three homilies in honor of the Mother of God (see below for details). After 1354, almost nothing is known about Kavasilas' life, apart from the fact that in 1363 he returned to Thessalonica for the funeral both of his beloved father and uncle Neilos Kavasilas. Nevertheless, it is without doubt that Nikolaos Kavasilas did not attain high ecclesiastical office but he remained a lay theologian until his death, as evidenced by the letters of Manuel II Palaeologus in 1387 and 1391 and Joseph Vryennios (ca. 1350–1431/32–38) around 1390–1396 addressed to him as a layman. Therefore, the common view held by many scholars in the past that Nikolaos Kavasilas, toward the end of his life, succeeded

his uncle Neilos Kavasilas as Archbishop of Thessalonica is rejected by modern scholarship.

Kavasilas' precise date of death is dubious. Older sources place his death in 1371, but this is a view no longer accepted by modern scholars who place his death after 1391 in Constantinople based on the chronology of Kavasilas' correspondence, according to which Kavasilas had been receiving letters from Demetrius Cydones after 1379, from the Emperor Manuel II Palaeologus (1387, 1391) and from Joseph Vryennios (1390–1396). It has also been suggested by Congourdeau (see Cabasilas 1989, p. 16, 2010, p. XVIII) that Kavasilas died either in the same period in which Cydones died (1397/1398) or shortly after Cydones' death, in 1399. Congourdeau points out that even though Kavasilas and Cydones were close friends, none of them seemed to be informed about the death of the other.

On June 1983, Nikolaos Kavasilas was canonized by the Ecumenical Patriarchate at the request of the Holy Synod of the Church of Greece on June 3, 1982. Nikolaos Kavasilas' feast day is celebrated on June 20.

Writings

Kavasilas was a prolific author who composed more than 30 works of which many of them are available in modern editions. Kavasilas' corpus is highly diversified and includes theological and philosophical treatises, legal and social writings, encomiastic works, homilies, poems, epistles, two eulogies (one for Matthew Kantakouzenos and the other for the Empress Anna Palaiologina), and one commentary on the third book of Ptolemy's astronomical *Almagest* (*Μαθηματικὴ Σύνταξις*). The following list provides a part of his wide-ranging writings, and thus it is far from being complete.

In addition to theological works mentioned above (*The Life in Christ*, *Commentary on the Divine Liturgy*, and the three Marian homilies), Kavasilas' theological writings feature homilies on the passion and ascension of Christ, encomia and homilies on saints (Saint Nicholas, Saint

Demetrius, Saint Andrew the Young of Jerusalem, and Saint Theodora), three exegetical treatises on the vision of Ezekiel, and an encomium to the Three Hierarchs of Eastern Christianity (Basil the Great, Gregory the Theologian, and John Chrysostom). A brief treatise entitled *Κατὰ τῶν τοῦ Γρηγοῤῥᾶ ληρημάτων λόγος* should be also included in Kavasilas' theological works. It is a polemic treatise against the anti-Palamite Nikephoros Gregoras, in which Kavasilas defends the teaching of Saint Gregorios Palamas. Its value lies in the fact that it is considered as the only work where Kavasilas clearly took sides as a supporter of Palamas in the second phase of the Hesychast controversy (1341–1347). It is worth mentioning, however, that Kavasilas did not deal with the theory of the divine light, also known as the theory of the uncreated light (whether the Tabor light, experienced by Hesychasts through ascetical practices, is created or not) which was one of the central questions in the Hesychast controversy. In general, Kavasilas' involvement in the Hesychast controversy still remains a debatable point among scholars.

Kavasilas' philosophical works include three treatises. In his treatise on the value of reason entitled *Λόγοι τῶν βουλομένων ἀποδεικνύειν, ὅτι ἡ περὶ τὸν λόγον σοφία μάταιον* (1970, Angelopoulos' edition), Kavasilas deals with the problem of secular education. His argumentation can be divided into two parts: in the first part he provides five arguments against the value of right reason (*ὀρθός λόγος*) drawing on Palamas' *Triads*, where, among others, the uselessness of secular education is underlined; and in the second part, Kavasilas rejects all these arguments, supporting the usefulness of secular education for a Christian. The same structure is found in his treatise *Κατὰ τῶν λεγομένων περὶ τοῦ κριτηρίου τῆς ἀληθείας, εἴ ἔστι, παρὰ Πύρρωνα τοῦ καταράτου* (1999, Demetracopoulos' edition, according to which the title runs as follows: *Against those things which are said on the criterion of truth, whether it exists, by the accursed Pyrrho*). As the title indicates, Kavasilas composed a series of refutations of skeptical arguments against the existence of a criterion of

truth. In the first part, he presents one proof in favor of the position held, and in the second part, he offers and refutes four skeptical proofs against the existence of a criterion of truth. His line of argumentation, however, is mainly based on Sextus Empiricus' exposition of dogmatic arguments found in his works *Πυρρώνειοι ὑποτυπώσεις* (*Outlines of Pyrrhonism*) and *Πρὸς λογικοὺς* (*Against the Logicians*). It has been argued that the aforementioned treatise is a piece of polemic against Nikephoros Gregoras' epistemology, but the identity of Kavasilas' opponent is still under discussion in modern scholarship. The unedited and unpublished *Περὶ συλλογισμοῦ* (*On Syllogisms*) is spurious and possibly should be ascribed to his uncle Neilos Kavasilas, whereas the other two short treatises (89 lines each in Angelopoulos' and Demetracopoulos' edition, respectively, see Kavasilas 1970, 1999) are available in modern editions.

Moreover, Nikolaos Kavasilas wrote four discourses that reveal the social, political, financial, and legal problems of Byzantine society. In his *Τῇ εὐσεβεστάτῃ Αὐγούστῃ περὶ τόκου* (*Address to Anne of Savoy on Usury*), distinguished for its rhetorical style, and in his *Λόγος κατὰ τοκιζόντων* (*Against Usurers*), both dating from the late 1340s or early 1350s, Kavasilas condemns the practice of usury and suggests an equitable system of taxation. In his *Λόγος περὶ τῶν παρανόμως τοῖς ἄρχουσι ἐπὶ τοῖς ἱεροῖς τολμωμένων* (*Discourse concerning illegal acts of officials committed against things sacred*), a lengthy treatise of legal argumentation, Kavasilas criticizes the confiscation of monastic property in order to finance the military needs of state, such as restoration of fortifications, recruitment of soldiers, and so on. And lastly, in his *Ἀθηναίοις περὶ τοῦ ἐν αὐτοῖς ἐλέου βωμοῦ*, he condemns the abuse of asylum in churches.

Innovative and Original Aspects

The originality of Kavasilas' thought lies in his Christocentric sacramental doctrines presented in

his two main spiritual theological works, *The Life in Christ* (Περὶ τῆς ἐν Χριστῷ ζωῆς) and *Commentary on the Divine Liturgy* (Ἑρμηνεία τῆς θείας λειτουργίας), which were written during the last years of his life. Both works constitute a profound exposition of the sacramental and liturgical life of the Orthodox Church. In his *The Life in Christ* (divided into seven books), Kavasilas criticizes the anchorite life and defines a spiritual life for the ordinary Christian that is grounded in the participation to the sacraments of Baptism, Chrismation, and Eucharist (Cabasilas 1974, 1989–1990). Providing an in-depth interpretation of the sacraments, Kavasilas establishes the sacraments as the means by which Christians participate in Christ's life. For Kavasilas, the life in Christ begins in the present life, namely, the union with Christ is real and mediated by the grace of the sacraments. In the same sense, Kavasilas in his *Commentary on the Divine Liturgy* (divided into 53 chapters) provides a detailed analysis of the symbolism of the liturgical prayers and particularly of the Eucharist which he regards as the completion of all sacraments (Cabasilas 2002).

Furthermore, Kavasilas (1974) wrote three homilies in honor of the Mother of God: *On the Nativity* (Εἰς τὴν γέννησιν), *On the Annunciation* (Εἰς τὸν εὐαγγελισμόν), and *On the Dormition* (Εἰς τὴν κοίμησιν) of Virgin Mary. His homilies are profoundly theological, albeit they do not constitute a systematic treatise, given that they are sermons, and as such they were written in order to be delivered in a congregation. Kavasilas' three Marian homilies are considered not only as the major source of his own Mariology but also as one of the most fundamental works on anthropocentric Mariology. In the first homily, Kavasilas deals with Virgin Mary's holiness; in the second homily, Kavasilas focuses on Virgin Mary's role in the divine plan of salvation; and in the third homily, Kavasilas elaborates the theory that Virgin Mary is at the summit of creation. The Christocentric and anthropocentric significance of Virgin Mary are fundamental to Kavasilas' Marian theology. His views can be summarized as follows: (1) Virgin Mary is glorified in terms of her relationship to Christ, because

she is Theotokos, Birthgiver of God; (2) being the Daughter of Israel and the Mother of Christ, Virgin Mary is the bond of union between the Old and the New Testament; (3) Virgin Mary was sinless but nevertheless inherited fallen human nature (Kavasilas refutes the Roman Catholic doctrine of the Immaculate Conception); (4) although Virgin Mary was chosen by God to be the Mother of Christ, she exercised her free will at the Annunciation, and thus her sanctity is the fruit of divine grace and free will; (5) Virgin Mary experienced physical death, and then she was assumed, body and soul together, into heaven (Kavasilas supports the Bodily Assumption of Virgin Mary); and (6) Virgin Mary is the supreme exemplar of the ultimate potentialities of humankind.

Impact and Legacy

Kavasilas' spiritual and theological writings are a significant contribution to Orthodox religious thought. His *Commentary on the Divine Liturgy* is one of the greatest explanations of the Orthodox Liturgy, and his *The Life in Christ* is one of the foremost treatises on sacramental Christology. By virtue of his three Marian homilies, Kavasilas is regarded as one of the Orthodox theologians who established the anthropocentric Mariology. Kavasilas' correspondence is a substantial biographical and historical source for the latter half of the fourteenth century, given that he engaged in extensive correspondence (18 extant letters listed in Cabasilas 2010) with many of his contemporaries, eminent ecclesiastical and political figures, including Demetrius Cydones, Gregorios Akindynos, the Empress Anna Palaiologina, the Patriarch of Constantinople Philotheos Kokkinos, and the Byzantine emperors, John VI Cantacuzenus and Manuel II Palaeologus.

Keckermann, Bartholomaeus

Born: Danzig (Gdańsk) in 1571, 1572, or 1573

Died: Danzig, 25 July 1609

Joseph S. Freedman

Department of History and Political Science,
Alabama State University, Montgomery,
AL, USA

Abstract

Bartholomaeus Keckermann (d. 1609) was a Reformed Protestant who taught at the University of Heidelberg and thereafter at the Gymnasium Athenaeum in Danzig (Gdańsk). Innovative was the publication of his writings on logic in multiple formats and his use of the concept of the systematic textbook (*systema*). Although he did not publish an encyclopedia, his publications cover a very wide range of subject matters; most of his monograph-length publications are included within two separate two-volume collections (1613 and 1614) of his publications as well as a separate collection (1617) of his publications falling within the parameters of mathematics. Keckermann's writings were widely read for many decades after his death.

Biography and Publications

Bartholomaeus Keckermann was born in Danzig (Gdańsk) in 1571, 1572, or 1573 to German Reformed Protestant parents. He attended the Gymnasium Athenaeum in Danzig (enrolling there in August of 1587). He then studied briefly at the Universities of Wittenberg (enrolling in May 1590) and Leipzig (enrolling in the spring of 1592) prior to moving to the University of Heidelberg, where he enrolled as a student on October 22, 1592.

Keckermann received his Master of Arts degree at Heidelberg on February 27, 1595. He then became assistant supervisor (*regens secundus*) at

the *contubernium* (student) dormitory there on April 23, 1595, and its principal supervisor (*regens primus*) on October 9, 1595. He resigned that position on August 10, 1596, in order to take a teaching position (third grade) at the *paedagogium*, at a university preparatory school in Heidelberg. In 1597 he then moved to become a teacher at the Collegium Sapientiae, a theological academy in Heidelberg under the auspices of the Palatine Electoral Prince; Keckermann continued to teach there after he became the Professor of Hebrew in the University of Heidelberg Philosophy Faculty on February 4, 1600.

He was considered but rejected for a professorship in theology at the University of Heidelberg in the year 1599. He received Licentiate of Theology degree there on March 23, 1602. In 1602 Keckermann left Heidelberg to become Professor of Philosophy at the Gymnasium Athenaeum in Danzig, where he remained until his death on July 25, 1609.

Heritage and Rupture with the Tradition

Bartholomaeus Keckermann utilized a wide range of authorities in his writings on logic, rhetoric, ecclesiastical rhetoric, Hebrew grammar, practical philosophy, ethics, family life (*oeconomica*), metaphysics, physics, mathematics (geometry, astronomy, optical, “naval mathematics” (*nautica*), geography, arithmetic), history, theology, and an introduction to the study of Cicero’s writings. Keckermann was among those authors at the beginning of the seventeenth century that published encyclopedic philosophical writings or published a wide range of works which – when taken together – constituted the same. While Keckermann profusely praises Aristotle, he also notes that Aristotle’s writings must be read and studied within the context of recent authors.

Innovative and Original Aspects

Exceptional were the multiple formats of his textbooks on logic. These include a prolegomena to logic (*Praecognitorum logicorum tractatus III*,

1599 ff. containing a history of logic and an outline of his full-length textbook on logic (*Systema logicae, tribus libris adornatum*, 1600 ff). He also published an abbreviated version of that full-length textbook (*Systema logicae, compendiosae methodo adornatum*, 1601 ff. and a treatise on applied logic (*Gymnasium logicum*, 1605 ff). Rudolph Goclenius published a tabular summary (84 tables on 46 pages) of Keckermann’s full-length textbook on logic (*Resolutio systematis logici maioris in tabellas pleniores, quam quae antehac fuerunt*). His writings on logic were able to be utilized for logic instruction at many academic levels.

Unusual was Keckermann’s treatise on practical philosophy, his *Apparatus Practicus* (1609). While according to its title it discusses ethics, family life (*oeconomica*), and politics, it also discusses history and logic, and it focuses primarily on politics and history. This treatise was intended to serve as a practical handbook for those students who were preparing for careers in public life.

Very worthy is Keckermann’s treatise on history. Although he claims that history is not an academic discipline, his work raises a number of important points pertaining to this subject matter. Very interesting is his systematic presentation of the subcategories of history, including the history of disciplines (individual academic disciplines as well as the history of books and libraries) and genres of historical writings. The treatise concludes with a lengthy, annotated, and well-organized commentary and bibliography of ancient, medieval, and recent historical writings.

Impact and Legacy

Keckermann’s writings had a substantial impact during his lifetime and for at least a half a century following his death. One factor contributing thereto was that many of Keckermann’s writings were published posthumously with the assistance of his Danzig students. Johann Heinrich Alsted (1588–1638), who also made substantial use of Keckermann’s writings, edited a two-volume collection of Keckermann’s writings published in the year 1613.

A second two-volume collection of Keckermann's writings was published in 1614; a collection of his writings on mathematics was published in 1617. Most of Keckermann's writings were reprinted two or more times; the last known published imprint was his collected writings on mathematics in the year 1661.

It was Keckermann's writings on logic – followed by his writings on rhetoric – that appear to have had the largest impact. A number of commentaries on Keckermann's logic and rhetoric were published during the three decades following his death. Attacks directed specifically against Keckermann were published – as monographs and disputations – beginning in 1599 and continuing for the following four decades; Keckermann's writings on logic and his views on theology were the principal foci of these attacks.

Keckermann used the term *systema* – in the title of his full-length textbook on logic in the year 1600. This apparently was the first use of the term *systema* in the title of a published monograph. The term *systema* was frequently used in the titles of monograph-length publications during the seventeenth century.

Khunrad

► [Khunrath, Heinrich](#)

Khunrath, Heinrich

Born: 1560, Leipzig

Died: 9 September 1605, Leipzig/Dresden

Peter Forshaw

Center for History of Hermetic Philosophy,
University of Amsterdam, Amsterdam, The
Netherlands

Abstract

Heinrich Khunrath was a German Paracelsian physician and theosopher who was the author of

a series of esoteric works promoting various kinds of alchemy and magic, as well as a particularly Christian form of Kabbalah around the turn of the seventeenth century. His most influential work, the baroquely illustrated *Amphitheatrum Sapientiae Aeternae* (Amphitheater of Eternal Wisdom) was first published in a very limited high-status edition in Hamburg in 1595, later reissued in a more widely available edition in Hanau in 1609. In the expanded 1609 edition, Khunrath intimates – and occasionally elaborates – on the complex interconnections between physico-chemistry, Christian Cabala, and Divine magic, in the context of theosophical reflections on 365 scriptural verses drawn mainly from the Solomonic books of the Old Testament. The *Amphitheatre* is famed in occult circles for its inauguration of a “theosophy of the image” (Faivre 1993, 2000), whereby the author explores interconnections, parallels, and harmonies between different levels of existence through four complex circular “hieroglyphic” and five rectangular “theosophical” figures, the best-known of which emphasizes the necessary relations between the Christian Cabalist oratory and the physico-chemical laboratory (Töllner 1991).

Alternate Names

Chunradt; Churad; Conrad; Conrathus; Cunrad; Cunradius; Cunraht; Cunrath; Kuhnrat, Henricus; Khunrad; Thrasybulus Ricens; Ricens, Thrasybulus

Biography

Heinrich Khunrath was born in 1560, the fourth of eleven brothers and sisters in the city of Leipzig, son of the merchant Sebastian Khunrath and Anna Meier (Humberg 2006). He enrolled at the University of Leipzig in the winter of 1570; following his studies in Leipzig, he completed

his medical training at the University of Basel, where he graduated with highest honors in 1588, defending theses *De Signatura Rerum* (*On the Signatures of Natural Things*), influenced by the works of Paracelsus and Giambattista Della Porta (Forshaw 2008). The following year, Khunrath met the English alchemist, mathematician, and magus, John Dee (1527–1608/9) in Bremen. Two years later, Khunrath was employed as personal physician to Dee's former patron, the Bohemian magnate Count Vilém Rožmberk (1535–1592), spending time with him in Prague (Gilly 2002). Following Vilém's death, Khunrath subsequently worked as a physician in North and Central Germany, with periods in Berlin, Hamburg, Magdeburg, and Gera.

His first publication, *Zebelis Regis et Sapientis Arabum vetustissimi . . . observationes accuratissimae* (*The most accurate observations of the ancient Arabian King and Sage Zebel*, 1592) was a fairly standard astrological work listing the physical affects to be expected when the moon progresses through the signs of the zodiac. More representative of his oeuvre, however, are the publications concerning alchemy, with works ranging from *chyrosopoeia*, or transmutational gold-making, to *chymiatría* and *spagyria* dealing with chemical medicine, and theo-alchemy (Telle 1988; Forshaw 2007a; Principe 2012; Tilton 2013), touching on the relation between alchemy and religion, with intimations of a spiritual alchemy of self-purgation, transformation, and rebirth. Khunrath's most comprehensive work on the laboratory art of *alchemy* is *Von hylealischen . . . Chaos* (*On Primaterial Chaos*, 1597a), in which he discusses the primal matter of the philosophers' stone. He develops his alchemical philosophy further in the *Symbolum Physico-Chymicum* (*Physical-Chemical Testament*, 1598), in which he interleaves spiritual and material notions of alchemy, including a short "philosophical song on the embodiment of the Spirit of the Lord in Salt," inspired by an alchemical reading of Genesis 1:2. In *Magnesia Catholica Philosophorum*

(*Universal Magnesia of the Philosophers*, 1599), he distinguishes between *magnesia*, or universal primal matter, and *chaos*, the primal matter of metals. In the same year, he publishes his *Warhafftiger Bericht von Philosophischen Athanor* (*Truthful Report concerning the Philosophical Athanor*, 1597b), in which he describes the alchemical furnace that he himself has invented. Not to be neglected are his posthumous publications: *Quaestiones Tres Perutiles* (*Three Highly Useful Questions*, 1607), the most iatrochemical of his works, in which he discusses cures for the Tartarean ailments of gout, calculus, and kidney stones, and *De Igne Magorum Philosophorumque* (*On the Fire of the Mages and Philosophers*, 1608), where he emphasizes that the philosophers' stone cannot be perfected without solar fire, as used by wise men and philosophers in antiquity for their supernatural magic and alchemy, claiming that the sun is God's fiery instrument in the macrocosmic laboratory. Further insights into Khunrath's magic are found in his manuscripts, particularly the *Consilium de Vulcani magica fabrefactione armorum Achillis* (*Counsel concerning Vulcan's Magical Fashioning of the Armor of Achilles*, Tilton 2006; Forshaw 2011).

Such notions earned Khunrath the censure of the Minim friar Marin Mersenne (1588–1648), friend of Descartes, and condemnation of the *Amphitheater* by the Sorbonne in 1625, as well as rejection by more orthodox Lutherans, Andreas Libavius and Johann Valentin Andreae (Forshaw 2007b). Khunrath's work nevertheless won the enthusiastic interest of generations of occult practitioners and esoteric thinkers, from the Pietist Johann Arndt (1555–1621), Rosicrucians Daniel Mögling (1596–1635) and Benedictus Figulus (b. 1567), the Boehmist Abraham von Franckenberg (1593–1652), the hermetic philosopher Robert Fludd, (1574–1637) to the English Mesmerist and spiritual alchemist Mary Anne Atwood (1817–1910), the French magus Éliphas Lévi (1810–1875), the Grand Master of the Hermetic Order of the Golden Dawn, Arthur Edward Waite (1857–1942), and the Swiss

psychiatrist and pioneer of Depth Psychology
Carl Gustav Jung (1875–1961).

Abstract

Kınalızade Ali Çelebi (1510–1572) was an Ottoman judge and scholar, who wrote the most comprehensive Ottoman ethical philosophical treatise, the *Ahlâk-ı Alâî*, closely following the *akhlâq* tradition.

Biography

Kınalızade Ali Çelebi was the son of a judge and poet. He studied in Istanbul and became an assistant to the *şeyhülislam* (chief mufti, 1539–1541) Çivizade (d. 1547). He taught in various colleges (*medreses*) in Edirne, Bursa, Kütahya, and finally Istanbul, before embarking on a judicial career. In 1563 he was sent as a judge to Damascus, then to Cairo, Bursa, and Edirne; in 1570 he was appointed judge of Istanbul and next year Anadolu *kazaskeri*, i.e., chief military judge of Anatolia. His son, Kınalızade Hasan Çelebi, was the author of a famous collection of poets' biographies.

Heritage and Rupture with the Tradition

Kınalızade wrote various treatises on jurisprudence, history, correspondence, and Holy Law (*shari'a*). His most important work is the *Ahlâk-ı Alâî* ("Sublime Ethics" or "Ali's Ethics," a pun with the author's name), which he composed in 1563–1565 in Damascus. This work, which constitutes an ambitious project to encompass a full view of ethics, became quite popular throughout the whole Ottoman period well into the eighteenth century.

Kınalızade's *Ahlâk-ı Alâî* builds on the legacy of Ottoman authors who translated or adapted into Ottoman Turkish the moral and political philosophy of the Islamic *falasifa* tradition, itself an adaptation of al-Fārābī (d. ca. 950), Ibn Sīnā (Avicenna, d. 1037), and Ibn Rushd's (Averroes, d. 1198) philosophy. It presents thus a combination of an Aristotelian analysis of the human soul with Plato's notion of the ideal city, as elaborated by Naşîr al-Dīn Ẓūşî (d. 1274) and his continuator Jalāl al-Dīn Dawwānī (d. 1502). The human condition is conceived as a continuum, from the human soul to society; Kınalızade's moral vision is in fact a study in government, in three escalating levels: from the individual morality, i.e., governing the self, to the family and household maintenance, i.e., what the ancient Greeks called economics (*οικονομία*: "the regulation or management of the household"), and, ultimately, to political theory, i.e., the governance of society. In all three levels, he employs the same analytical tools: the division of entities to components and the quest for the mean and for equilibrium which can lead to harmony and order. The notion of the four cardinal virtues (wisdom, justice, honesty, and courage) and their subvirtues, with the respective vices, is central to Kınalızade's moral philosophy. Kınalızade's political ideas are based on al-Fārābī's neo-Aristotelian division of political communities and Ẓūşî's concept of a society consisting of four categories of people ("men of the pen," "men of the sword," merchants and craftsmen, and farmers). These segments correspond to the four elements and have to be kept at equilibrium through sultanic justice.

Innovative and Original Aspects

Kınalızade follows his model, Dawwānī's *Akhlaq-e Jalālī*, very closely, often almost verbatim. This permits us to follow exactly the few points where he chose to deviate from his model. In two instances he seems to have read and used Ibn Khaldūn's (1332–1406) *Muqqadima*, while in another two, he emphasizes the role of Sharī'a over that of Sultanic law or *kanun*, attacking thus the legal synthesis of the chief jurisconsult

Ebussu'ud (1490[?]-1574), under Süleyman the Magnificent (1494-1566, r. 1520-1566).

Impact and Legacy

Kınalızade's voluminous treatise remained a classic for the centuries to come; notions, such as the "circle of equity (or justice)" or the division of society into four major classes, were to dominate or at least to be present in almost every Ottoman treatise of political advice composed from the mid-sixteenth century onward. On the other hand, however, his political ideas became more and more marginalized. Already in his time, Dawwānī's fashion had waned in favor of Kashifī's popularization, which privileged concrete ethical and political advice over philosophical reflection. What is more important, in Kınalızade's times the characteristically Ottoman "mirror for princes" *genre*, with its stress on specific advice and on institutions rather than the personal qualities, had already been inaugurated. In spite of its tremendous popularity, thus, *Ahlāk-ı Alâî* was the swan song rather than the beginning of a tradition.

Kircher, Athanasius

Born: 2 May 1601/1602? Geisa near Fulda

Died: 27 November 1680, Rome

Iva Lelková

Department of Comenius Studies and Early Modern Intellectual History, Institute of Philosophy, Czech Academy of Sciences, Prague, Czech Republic

Abstract

Athanasius Kircher was a Jesuit, a Baroque polymath, and an author of more than 30 works on various subjects ranging from hieroglyphics, time measurement, magnetism, music, and optics through astronomy, history, and the cultures of China and Egypt to universal language, Noah's Ark, and the Tower of Babel. He is often described as "the last man who knew everything" (Findlen 2004), as "the master of hundred arts", and as a Baroque polymath standing between Renaissance and modern episteme, but also as a "man of misconceptions". He published not only experiments and observations which were progressive and new in his time but also some theories that are considered false by today's

science and were considered false already by many of his contemporaries. In a search for universal knowledge leading back to *prisca sapientia* and hermetic writings, Kircher believed that deciphering hieroglyphs and finding the basis of all languages and cultures would prove the existence of only one original universal religion and therefore support the return of Protestant Churches to the Roman Catholic Church. Kircher's writings and theories were a mixture of Aristotelian natural philosophy, Renaissance Platonism, and Corpus Hermeticum with a specific addition of Lullian combinatorial art. Kircher also drew heavily from the work of Nicholas of Cusa (1401 – 1464), especially in his astronomical work, although without acknowledging it. Stuttgart: Franz Steiner Verlag, 2006). Kircher's celebrated museum attracted many visitors from across Europe, and Kircher sustained a large correspondence based not only on personal encounters but also on utilizing the Jesuit communication network. He was supported by emperors, popes and a number of nobles, and leading church figures and scholars, and his books were published in numerous editions and print runs. However, he was generally either forgotten or considered to be an eccentric fool for about 300 years. The new interest of scholars in the borders of modern science and its rise, as well as their interest in the communication strategies and practice of Early Modern scholars, has now turned Athanasius Kircher into one of the most studied Early Modern figures of the last few decades. Athanasius Kircher also appears in popular culture, due to the similarities between his eclecticism and the postmodernist movement.

Biography

The most important (though biased) source for Kircher's biography is his autobiography published by advocate in Augsburg, Hieronymus Ambrosius Langenmantel (1641 – 1718), toward the end of Kircher's life (Kircher 1684; Seng 1901; Totaro 2009; Louthan 1999; Fletcher 2011). Kircher was

born on 2 May 1602 in Geisa, near Fulda, to the reeve Johann Kircher and his wife Anna née Gansek as their ninth and youngest child (Jäger 2002). The year of his birth is uncertain and may be 1601 (Fletcher 1988). Kircher studied at the Jesuit gymnasium in Fulda from 1614 to 1618 and entered the Jesuit order in Paderborn in 1618. He studied philosophy and logic after the end of his 2-year novitiate. The Jesuit college in Paderborn then had to be closed due to the 30-year war, and Kircher fled Paderborn on 23 January 1622. He finished his studies of philosophy and natural philosophy in Cologne (Köln am Rhein) and was sent to Koblenz to study mathematics and languages in 1623. Soon afterward, however, he was sent to Heiligenstadt to teach Greek grammar. From there Kircher was called in by the Archbishop and Elector of Mainz, Johann Schweikhard (1553 – 1626), to Aschaffenburg to measure a new hilly road to Heidelberg in 1624. It was before Schweikhard's death at the beginning of 1625, not afterward, as he himself asserted in his autobiography, that Kircher returned to Mainz to study theology (Wittstadt 2002). He was ordained a priest in 1629 and passed the third probation year in Speyer, where he encountered a book describing obelisks erected in Rome by Pope Sixtus V (1521 – 1590). This book started Kircher's lifelong interest in the hieroglyphs and culture of ancient Egypt. Kircher was called to Würzburg to teach moral philosophy, mathematics, Syriac, and Hebrew, most likely in the year 1630 (Siebert 2008). There he met his student and lifelong friend and collaborator Kaspar Schott (1608 – 1666), and in 1631 published his first book *Ars magnesia* (Vollrath 2007). Kircher fled from Mainz to Speyer shortly before the troops of Gustav Adolf (1594 – 1632) entered the city on 15th December 1631. From there he was sent to France, like many of his confrères (Siebert 2008). After a short stop at colleges in Dôle and Lyon, he settled in Avignon where he is believed to have taught mathematics, philosophy, and oriental languages. There, he became acquainted with the major figures of the Republic of Letters: Nicolas-Claude Fabri de Peiresc (1580 – 1637), Pierre Gassendi (1592 – 1655), and Johannes Hevelius (1611 – 1687). At the same time, he entered into contact with the astronomer Christoph Scheiner (1573 – 1650). His second

work, *Primitiae gnomonicae catoptriace*, was published in Avignon in 1635. Kircher left Avignon in the autumn of 1633 heading for Vienna; however, he became a professor of mathematics and Oriental languages at Collegio Romano in Rome. Kircher was to continue work on the decipherment of hieroglyphs under the patronage of Peiresc's friend Francesco Barberini (1597 – 1679) and his uncle Maffeo Barberini (1568 – 1644), who was Pope Urban VIII at that time (Siebert 2008). With the exception of 2 years between 1637 and 1638, when Kircher was traveling to Malta and Sicily as a companion to the new convert Friedrich of Hesse-Darmstadt (1616 – 1682), he never left Rome from November 1633 until the end of his life. On this trip Kircher experienced an earthquake in Calabria, the eruption of Etna and Stromboli, and even lowered himself to the crater of Vesuvius. Inspired by these experiences, he published work on geological processes and the underground world *Mundus subterraneus* later in 1664–1665. In the years following his arrival in Rome, Kircher published the first Coptic grammar in a European language (*Prodromus coptus sive aegyptiacus*, 1636) and vocabulary of Coptic, Arabic, and Latin (*Lingua aegyptiaca restituta*, 1643). He continued to explore the idea of universal magnetism in a work titled *Magnes sive de arte magnetica* (1641). *Magnes* was the first work dedicated to the emperor Ferdinand III (1608 – 1657), who supported Kircher by paying him a yearly pension until the end of his life in 1657. Kircher became a consultant to a cardinal commission for the translation of the Bible into Arabic in 1644, and 2 years later was released from his duties of mathematics professor at the Collegio Romano so he could concentrate on his scholarly activities and writing (Findlen 2004). He published a work dealing mostly with comets, optics, sundials, and the nature of colors, titled *Ars magna lucis et umbrae* (1645). In 1650 he published the *Musurgia universalis* – a work on the theory and history of music and also on musical instruments and automata. The book was printed in 1500 copies, which was a considerable number for that time. In 1651 Alfonso Donnini (– 1651) donated his vast collection of antiquities to the Collegio Romano, and Kircher became custodian of this collection. From this and his own private

collection, Kircher created a museum which became a popular stop for travelers to Rome, including Christina, Queen of Sweden (1626 – 1689), Marin Mersenne (1588 – 1648), Leopoldo de' Medici (1617 – 1675), Robert Southwell (1608 – 1677), and many others (De Sepi 1678; Casciato et al. 1986; Findlen 1994; Gorman 2001; Wadell 2015). Among various exhibits were 12 volumes of Kircher's international correspondence, which is an invaluable source of information on Kircher's work and life, as well as on patronage strategies, distribution of books, collection of information for his books and communication practices (Gorman and Wilding 2003; Gorman and Sutherland-Duchacek 2011; Malcolm 2004). Kircher's former student from Würzburg, Kaspar Schott (1608 – 1677), was called to Rome in 1652 to help Kircher correct and publish the work on the geography and history of Egypt: *Oedipus Aegyptiacus* (1652–1654). In subsequent years, Kircher also published an astronomical work – the fictional journey of the angel Comiel and Kircher's alter ego Theodidactus to the universe, introducing a semi-tychonic model of the universe, *Itinerarium extaticum* (1656), and a continuation *Iter extaticum II* (1657), which was the fictional journey of the angel Hydriel to the underground world and to the bottom of the oceans. This work served as a preview to *Mundus subterraneus* (1664–1665). His book on the cause of plague *Scrutinium pestis* (1658) was one of the first to suggest the cause of plague to be microorganisms and not astrological influence or moral depravation, which were the usual explanations. He also refused to accept supernatural causes in the case of crosses that appeared on people's clothes after the eruption of Vesuvius and explained the phenomenon in his work *Diatriba de prodigiosis crucibus* (1661) as the special weaving of fabric. At this time Kircher's discovery of the dilapidated church of St. Eustace, built by emperor Constantinus in Mentorella close to Tivoli, had a major impact on his life. Kircher raised money for the restoration of the church from his numerous supporters and through the publication of *Historia Eustachio-Mariana* (1665b). In the same year Kircher published the work on mathematics *Arithmologia sive de abditis numerorum mysteriis* (1665c) as well as the previously mentioned *Mundus subterraneus* (1664–1665).

However, his most translated work was *China illustrata* (1667a), where Kircher gathered information on the geography, history, and culture of China from Jesuit missionaries. Kircher published his method for the creation of a basis for all sciences in *Ars magna sciendi* in 1669. The last decade of Kircher's life was marked by increased criticism of his work, especially of his ignorance of the region after the publishing of *Latium* (1671). Kircher withdrew to Mentorella in 1674, trying to find an escape from the constant flow of correspondence and visitors. Before the end of his life in 1675, he published *Archa Noë* dealing with the size and organization of Noah's Ark, as well as with possible crossbreeding of animals (Breidbach and Ghiselin 2006). He continued this attack against skepticism with *Turris Babel* (1679b), a work discussing the population of the world after the deluge and the diversification of languages from the original Hebrew. In 1676 Kircher published an interpretation of inscriptions on the mummies imported to Europe around that time titled, *Sphinx mystagoga sive Diatribe hieroglyphica* (1676). Kircher's health slowly deteriorated. He took the last rites as early as the summer of 1679 and died on 27 November 1680 on the same day as his friend, the sculptor Gian Lorenzo Bernini (1598 – 1680). According to his wishes, his body was buried in the church Il Gesù and his heart in the church of St. Eustace in Mentorella.

Kircher's autobiography describes his miraculous escapes from dangers of various kinds. Kircher survived a fall under the hooves of racing horses, another through the ice of the frozen Rhine while crossing it, and another fall into a water mill, an encounter with Protestant soldiers who forced him to take off his habit, and a plague in Rome. The emphasis on these miraculous survivals in his autobiography may be credited to Kircher's self-styling into the role of saint-scholar (Louthan 1999).

Kircher managed to draw the attention of powerful patrons throughout his life. Among his supporters were the emperors Ferdinand III and Leopold I (1640 – 1705), Archduke Leopold Wilhelm (1614 – 1662), the popes Innocent X (1574 – 1655), Alexander VII (1599 – 1667), and Clement X (1590 – 1676), and a number of major European nobles and church figures. While his contacts with Central Europe and Italy were

outstanding, as were those with some of the Protestant princes in the Empire such as Duke August the Younger of Wolfenbüttel (1579 – 1666), he did not create strong ties to the scholarship of the Royal Society with the exception of his correspondence with Robert Moray (1608 – 1683).

Heritage and Rupture with the Tradition

While striving for universal knowledge, Kircher also strived for universality of Catholic religion. Kircher's works gained special reception in Catholic countries, especially in the Habsburg Empire. There, their universalist claims resonated well with the educated Catholicism which was a distinctive Central European amalgam (Evans 1979). As he never left Rome, he had to believe the news and observations from other parts of the world, misrepresented as they often were. He considered Chinese, Mayan, or Inca culture to be the proof of an original unity of mankind and the perfect knowledge before the deluge and confusion of languages. Kircher's thesis seemed to be supported by the similarity between the hieroglyphic, Mayan, and Chinese scripts. News and observations from these parts of the world, originating from traditional knowledge, were equal to a travel through time for him. What was remote in place was also remote in time. All this encouraged Kircher in his search for *prisca sapientia*, the perfect knowledge contained in hermetic treatises that was fundamental to all religions and philosophy. He never doubted their authenticity and antiquity, in spite of Isaac Casaubon's (1559 – 1614) early seventeenth century evidence to the contrary. Kircher's works, especially *Oedipus Aegyptiacus*, should have helped to find this ancient knowledge and the one and only true religion, as this was according to him the key argument against Protestant Churches and should have led to their union with the Roman Catholic Church (Stolzenberg 2013).

Hence, Kircher and his work can be considered interesting evidence of the importance of hermetic and magic reasoning for the establishment of modern science. Mechanistic philosophy developed partially from the attempt to explain occult qualities such as acting at a distance (magnetism,

gravitation). Athanasius Kircher used the interpretative frame of Renaissance Platonism to account for these phenomena. Kircher also propounded universal magnetism (Gorman 2004) and the spontaneous generation of plants and animals, as he believed in *panspermia rerum* – an emanating force filling the universe and giving life to everything in it (Rowland 2004). Kircher believed in palingenesis – the growth of plants from their ashes – as well as in astrological influence on human health, mermaids, griffins, and dragons. While his works often collected up-to-date information, they also contained superstition and fables, which mirrored his naiveté as well as a necessity to believe reports he was not able to verify on his own. All knowledge was, according to Kircher, unified in the idea of the *mathesis universalis*, which is best described as universal magnetism integrating the organic as well as the inorganic world. Kircher described the attraction between the sexes as well as the attractive force in the universe by this universal magnetism. Magnetism as a principle of unity of contradictions became an explanative model for phenomena in particular sciences – light and shadow in optics or consonance and dissonance in music. Kircher, like many of his contemporaries, was interested in mechanical instruments and toys of all kinds. He constructed, for example, a *laterna magica*, Aeolian harp, speaking trumpet, sunflower clock and talking statues. Among the mechanisms were also the mathematical or musical organs – instruments which combinatorially generated mathematical problems and their solutions or musical themes (Vollrath 2002a, b). His universal language, which would have been not only a tool for understanding but also for exact research, was inspired by the work of Ramón Llull and his combinatorial art (*Ars magna sciendi*, 1669). As Kircher was considered to be an expert in steganography and coding, in 1666 he received from his long-time correspondent physician Johannes Marcus Marci (1595 – 1667) from Prague the so-called Voynich manuscript – a medieval botanical treatise written in an unknown cipher script – in the hope that Kircher would be able to decipher it. However, this has not been decoded up until today (Neal 2016; Zandbergen 2016).

Innovative and Original Aspects

Thanks to his broad range of interests, Kircher is often regarded as a founder of newly established scientific disciplines. Kircher published in his *China illustrata* botanical, zoological, anthropological, and historical observations of Jesuit missionaries in China (Kircher 1987; Hsia 2004). While drawing a link between Chinese script and hieroglyphs, which resulted from his thesis of *prisca sapientia* as a common source of all religions and knowledge, Kircher stressed the presence of Nestorian Christians in Chinese history. The first description of Potala Palace in Lhasa and the first Chinese dictionary and grammar of Sanskrit can also be found in *China illustrata*.

Kircher is sometimes considered to be the founder of Egyptology by publishing the first Coptic grammar in the European language and the first vocabulary of Coptic, Arabic, and Latin in parallel columns, which later helped Champollion (1790 – 1832) to decipher the Rosetta stone. Kircher established the connection between Greek, Coptic, and Ancient Egyptian as well as the relationship between hieratic and hieroglyphic script. He also recognized the phonetic value of hieroglyphs. However, he considered hieroglyphs to be occult symbols containing ancient knowledge of *prisca sapientia* and spoken by Hermes Trismegistus or Moses, which caused his translations to be false (Stolzenberg 2013). His credit in this field is mainly in collecting and describing the Egyptian monuments of his day.

As a founder of geology (*Mundus subterraneus*) he was one of the first to study the Earth as a whole and offered a theory of the geological processes as being governed by a self-regulating equilibrium of water and fire (Okrusch and Kelber 2002). According to this theory, the oceanic waters fall through a gigantic maelstrom at the North Pole through the Earth's interior to emerge at the South Pole. The seas are connected through underground channels in the same manner as the central fire travels through subterranean routes.

While he remained true to the theory of sympathetic substances in explaining the effectiveness of snakestone for curing poisonings (Baldwin 1995), he suggested the cause of plague to be a

microorganism instead of astrological influence or moral depravation. Even though he was using a microscope for his study, he could not see the true plague agent but rather red and white blood cells (Baldwin 2004). Nevertheless, he suggested hygienic measures to prevent the spread of the disease. In case of the miraculous crosses that appeared on the clothing of people after the eruption of Vesuvius, he offered as a natural explanation the special weaving of the fabric. Kircher often supported his arguments by experiments that were later selected and published by Johann Stephan Kestler (*Physiologia Kircheriana experimentalis*, 1680).

Konteleon

► [Konteleon, Christophoros](#)

Kontoleon, Christophoros

Born: Late Fifteenth Century, Monemvasia

Died: Mid Sixteenth Century

Nikos Panou

Department of English, SUNY Stony Brook,
Stony Brook, NY, USA

Abstract

Biographical information about Christophoros Konteleon, a Greek-speaking humanist active

mainly in the first half of the sixteenth century, is scarce. The few things that are known about him, however, paint a picture of someone who was one way or another associated with major figures, Greek, Italian, and French, in the religious, political, and intellectual scene of the period. Ranging from Biblical and Homeric exegesis to religious tracts and from Aristotelian commentaries to political theory, his works are not without interest, especially as they exhibit a tendency toward original thinking while combining Christian and classical ideals as well as Aristotelian and Platonic worldviews.

Alternate Names

[Konteleon](#); [Kontoleos](#)

Biography

Not much is known for sure about the life and activities of Christophoros Kontoleon (also attested as Konteleon and Kontoleos). He was born in Monemvasia in the Peloponnese, most likely toward the end of the fifteenth century, and died at some point after the middle of the sixteenth century. He was a low-ranking cleric, who made a living, mainly in Italy, as a manuscript copyist and perhaps as a teacher and scholar (Meschini 1973). There is no information as to how and when he found his way to Italy, but it was possibly with the help of Arsenios Apostolis (ca.1465–1535), the Catholic bishop of Monemvasia, who also engaged him as a copyist in the *scriptorium* that operated under his direction, probably in Florence, at least from 1519 to 1521 (Cataldi Palau 1986b). Kontoleon was also in the service of Cardinal Niccolò Ridolfi (1501–1550), Pope Leo X's nephew, together with other Greeks, such as Nikolaos Sofianos (ca.1500–1550) and Matthaïos Devaris (ca.1505–1581), who, among other things, compiled a catalog of the cardinal's celebrated library (Muratore 2009). Within that context, he may have been involved in the four-volume *editio princeps* of Eustathios of

Thessaloniki's commentaries on the *Iliad* and the *Odyssey* (Rome, 1542–1550).

Other than that, the basic source of information regarding Kontoleon and the circles he moved in is a letter written in Rome in August 1536 by Guillaume Pellicier (ca.1490–1568), bishop of Maguellone and later ambassador of France to Venice. Pellicier had travelled to Rome in 1534 to obtain the pope's permission to transfer the seat of his bishopric to Montpellier. He stayed there until 1536, during which time he immersed himself in the study of antiquity and the intellectual life of the city. The letter in question (published in Dorez 1894) is addressed to Cardinal Jean du Bellay (1492–1560), who had been bishop of Paris since 1532. Kontoleon, who had copied one of his own works for Pellicier (Cataldi Palau 1986a), is mentioned by name in the letter. Pellicier identifies his place of birth and confirms his association with Niccolò Ridolfi, although without specifying his role in the cardinal's household. More importantly, he reminds his addressee that Kontoleon had been at the French court with them three years earlier, at which point du Bellay had interceded "very favorably" with the king, Francis I (1515–1547), to have him naturalized as French. Now Pellicier pleads with him on Kontoleon's behalf to pursue the issue urgently. Cardinal Ridolfi had already written to the Parisian bishop twice about it and Pellicier had also contacted Jean Chapelain, one of the king's physicians, who had formed a liking for Kontoleon during his sojourn in France. There is no way to know why Kontoleon wanted to become French and what opportunities he thought worth exploring as such, but it seems that, despite active patron support, that plan never materialized: his name is nowhere to be found in the registers of Francis I's acts.

Works

Apart from an epigram published in the 1517 *editio princeps* of Libanius' *Orations* in Ferrara, all of Kontoleon's writings remained in manuscript form during his life and for a long time

thereafter. His output – more than 30 works in total – could be roughly classified into four groups: (1) Biblical exegesis, focusing on themes or passages from the Old and New Testament, (2) Homeric exegesis, consisting mainly of moral or allegorical interpretations of the *Iliad* and the *Odyssey*, (3) Philosophical works ranging from Aristotelian commentaries, mostly on *Categories*, to original texts on a variety of topics, such as the immortality of the soul, impermanence, happiness, law, statecraft, and aristocracy, (4) Miscellanea: two more original epigrams, one of them dedicated to the Ferrarese humanist and diplomat Celio Calcagnini (1479–1541); an unfinished commentary on the epigrams of Ianos Laskaris (ca.1445–1534); a piece on Euclid; a paradoxical praise of hypocrisy; a letter to Pope Paul III (1534–1549) advocating the revitalization of the study of Greek and Latin; and two propagandistic texts promoting the union of the Churches and Papal primacy against Lutherans, respectively. Three of these works are missing. Of the rest, the following are currently available in modern editions: the treatise *Περὶ ἀθανασίας ψυχῆς*, the Libanius epigram, the preface to the commentary of Laskaris' epigrams, and the letter to Pope Paul III (Meschini 1973); the dialogue *Περὶ ἀρχῆς* (Meschini 1977); the other two epigrams and the two propagandistic tracts (Pontani 1988); and the six Homeric writings (Piasentin and Pontani 2018).

In secondary literature, Kontoleon emerges as an author whose systematic study would most likely yield interesting results, especially if more of his works were readily available. He has been regarded as the first Greek born after the fall of Constantinople to have delved into issues and questions of a philosophical nature (Papadopoulos 1988). At the very least, it has been shown that his writings on the Homeric epics (Pontani 2018; Piasentin and Pontani 2018), on politics (Meschini 1977; Takourli 2003), and the immortality of the soul (Meschini 1973; Marazopoulos 2003; Psimmenos 2003) merit consideration both per se and in relation to the scholarly production of the period. In these works, Kontoleon appears invested in harmonizing ancient wisdom with Christian standards. At the same time, an incipient

emancipation from Aristotle's authority seems to have influenced, if only slightly, his analytical approach. Although the Stagirite was clearly Kontoleon's main frame of reference, as expected at that point (Psimmenos 1988), he did not hesitate to distance himself from Aristotelian views when deemed necessary, foregrounding instead his own ideas and definitions or seeking viable alternatives in Plato and the Neoplatonic tradition. His two published philosophical endeavors are characteristic in that respect.

The treatise *On the Immortality of the Soul* (*Περὶ ἀθανασίας ψυχῆς*) does not lend itself easily to classification based on standard typologies of post-Byzantine philosophical or theological inquiry. Moving within the parameters of Christian doctrine, Kontoleon generally follows Aristotle's discussion in *Metaphysics* and *De Anima*, starting already with the latter's assertion that research into the essence and properties of the soul is an instrumental kind of study as it contributes greatly to the understanding of nature. Nevertheless, he also introduces an anti-theoretical tension by rejecting or calling into question key aspects of the Aristotelian conception of the soul as the driving force of all living organisms. The space opened up by this detachment from Peripatetic authority enables Kontoleon to offer his own original explications, on issues ranging from ontology to the soul's incorruptibility, locomotive capacities, and relation to intellect and the material body. He also explores Platonic insights, as elaborated in the *Phaedo*, for instance, or in Plotinus' *Enneads* and Proclus' *Elements of Theology*, which he adopts and incorporates in his exposition, though without explicit attribution. Having set out to prove the immortality of the soul as convincingly and comprehensively as possible, Kontoleon engages in an analysis that, among other things, borders on pantheism. In that context, not only is the life force known as soul treated as a premium mediator between the physical and the metaphysical, but is also invested with concrete ethical dimensions as it is linked with an instinctive awareness and fear of God, primary substance and supreme judge of all, on the one hand, while also being related to the pursuit of happiness

(*εὐδαιμονία*), the elusive reward for virtuous existence, on the other.

Dedicated to the duke of Florence Alessandro de' Medici (1531–1537), the dialogue *On Rule* (*Περὶ ἀρχῆς*) has an exceptional place in sixteenth-century Greek philosophical production, both in terms of its political relevance and in terms of its unapologetic Platonism. Worlds apart from Machiavellian *Realpolitik*, Kontoleon's discussion of the abilities, skills, and duties that being in charge of a state entails is inscribed within a tradition of political idealism and virtue ethics that clearly has its roots in Plato's *Republic*. Although in the course of the dialogue he does not refrain from modifying or refining certain aspects of Platonic theory, he leaves no doubt as to the basic tenets of his political vision: he is promoting the ideal of a philosopher king who is able to achieve a smooth, creative balance between abstraction and praxis; is amply endowed with key royal virtues; and rules over a body politic that observes, both in character and in function, the tripartite division of the human soul. Once again, what is interesting here is that Kontoleon's embracement of Platonic thought and method feels rather unconventional in a period marked by a predominance of Aristotelianism at the expense of the vigorous Platonic revival that had been cultivated by Georgios Gemistos Plethon (ca.1355–1452) and his disciples or supporters. Although steeped in the Aristotelian canon, Kontoleon was also open to, and well versed in, Plato and Neoplatonism, which may have been, at least partially, a result of his stay in Florence, a stronghold of Platonic studies since Leonardo Bruni (ca.1370–1444) and especially after Marsilio Ficino (1433–1499). Whatever the cause, it is this access to the Platonic tradition, in conjunction with personal quests and inclinations, that seems to have provided a vital platform for his preoccupation with issues and questions of political scope and interest, a preoccupation sustained enough to be regarded as unique among Greek-speaking intellectuals of the period. Indeed, other than the *Περὶ ἀρχῆς*, also of Platonic inspiration is Kontoleon's *On Laws* (*Περὶ νόμων*) as well as his works on aristocracy as the best constitution.

Korinthios, Manuel

Born: probably Corinth, Peloponnesus, circa 1460

Died: Constantinople (Istanbul) around 1530/1531 (or 1551)

George Zografidis

Department of Philosophy, School of Philosophy and Education, Aristotle University of Thessaloniki, Thessaloniki, Greece

Abstract

Manuel (Emmanuel) from Corinth was a post-Byzantine theologian, a Grand Orator of the Ecumenical Patriarchate, a hymnographer of the Orthodox Church (c. 1460–c. 1530/1531), and the Director of the Patriarchal Academy in Constantinople. In addition to his hymnographical and rhetorical work and his teaching activity, Manuel pursued two-pronged theological project: (a) to refute what he considered as Plethon’s Platonism and

Pagan polytheism and to show the alleged impiety of two major late Byzantine thinkers (Plethon and Bessarion) and (b) to point out the several points of divergence of the Latin Church from the Orthodox faith and to argue for the purity of the latter, by continuing the doctrinal tradition of Gregory Palamas and Hesychasm. In the long Byzantine controversy between Platonists and Aristotelians, Manuel took the part of Scholarios (Gennadios II), and thanks to his institutional role, he reaffirmed the domination of Aristotelianism during the first centuries of post-Byzantine and Modern Greek intellectual life.

Biography

Manuel (or Emmanuel) was born perhaps in Corinth, in the Peloponnese in the mid-fifteenth century (circa 1460). Little is known about his life (Patrinelis 1962; Trapp 1997). He studied under Matthaios Kamariotes, the first Director of the Patriarchal Academy of Constantinople (the so-called Great School of the Nation) that Scholarios had established just after the Fall of the Byzantine capital for the education of the Christian clergy. From his youth (1484 onward), Manuel served as a priest in several offices in the Patriarchate, as a grammarian, as the personal secretary (*Hartophylax*) of three successive patriarchs (1505–1521), and as a “great orator” of the Church (from 1504 probably until his death). He was appointed Director of the Patriarchal Academy, and he taught there for several years (1505–1521?); the school curriculum must have included philosophy (Aristotelian logic) and rhetoric (based on Hermogenes). After a long and esteemed career, he was considered at his times as “most wise and outstanding in theology.” He died in Constantinople (Istanbul) around 1530/1531 (or 1551).

Given the dramatic intellectual situation just few decades after the Fall, Manuel’s effort was remarkable. He wrote numerous services, canons, hymns, hagiographies, and other liturgical texts, funeral and didactic orations, letters, as well as theological and philosophical treatises; the major

part of them remains unpublished. During his early years at the Academy, Manuel copied a manuscript of Origen’s *Against Celsus* and the four volumes of the great 1484/1485 Constantinopolitan edition of the *Corpus Aristotelicum* (Förstel 1999).

Manuel’s theological treatises are mostly anti-Latin: *That there is no purgative fire after death* (before 1511), *Apology and refutation of some chapters of the Dominican Francesco* (1523), *Against two Latin syllogisms on the procession of the Holy Spirit*, and *On the time of deification of Jesus’ body*. Of philosophical interest are two other polemical treatises: *Discourse on Markos the Holy Metropolitan of Ephesus and the Council of Florence, against Gemistos (Plethon) and Bessarion, and rejection of their impious writings* (before 1511), and *Against Plethon’s writing on the procession of the Holy Spirit*.

Philosophical and Theological Ideas

To understand the intellectual setting of the late fifteenth and sixteenth century, we must take into account that after the Fall of the Byzantine Empire, Greeks and other Orthodox people had become subjects of a non-Christian empire. Thus, the conservation of their religious identity was an absolute priority for the only Christian institution permitted, the Ecumenical Patriarchate in Constantinople. Since the majority of Greek scholars had already fled to the West, the main concern of the few remaining intellectuals (and Manuel among them) and the upper Orthodox clergy was to ensure the knowledge of the “divine and sacred letters.”

The Academy played a decisive role for the theological and intellectual education of the future Christian officials in the Ottoman Empire, and Manuel’s contribution cannot be underrated. His manifold activity and its acceptance in the ecclesiastic circles made him a man of influence and authority. Manuel was involved even in the composition of a “mirror for princes” that is attributed to Neagoe Basarab and is regarded as one of the foundational sources of Romanian moral and political thought of that period.

One of the Manuel's main theological aims as a Patriarchate official was to understand the Latin Church, point out the several points of its divergence from the Orthodox faith, and argue for the purity of the latter. To achieve this he totally endorsed the doctrinal tradition of Gregory Palamas and Hesychasm. His anti-Latin attitude was built on the forceful trend of anti-unionists that prevailed in Constantinople before the Fall, but nevertheless it would be welcome by the new Ottoman rule. In his theological writings, Manuel draws a clear line between the two churches and discusses their differences on the *Filioque*, the existence of Purgatory, the unleavened bread, the divine contemplation of the saints, and the Pape's primatum. He refutes the argumentation of the Latins in a moderate style and with references to Augustine, Hieronym, and other Latin Fathers. It is noteworthy that he ascribed to Origen the introduction of the doctrine of the purgative fire (Förstel 1999) merging Catholic Purgatory and the *apokatastasis* theory of the early Father. However, in a more personal tone, Manuel does not hesitate to distort and misinterpret Bessarion's texts only to present him as "fighting against God," probably because the Greek theologian and philosopher abandoned Orthodoxy and became a Cardinal (*Discourse on Markos* 1923/1977; Psimmenos 2007).

Complementary to Manuel's critique of Latin theology was his concern to reinforce Aristotelianism as more appropriate to the Christian faith. The dispute between late Byzantine Platonists and Aristotelians, intensified by Plethon, was not anymore a historical-philosophical problem. Plethon combined Plato's supremacy over Aristotle with a return to pre-Christian Greek forms of life – as a part of the solution of the difficult political situation. After the Fall Greek scholars in the West reframed the dispute within the philosophical and cultural Renaissance interest to classical antiquity and especially to Plato. But for those who remained in the East Platonism was too closely connected to (Plethon's) paganism; thus Aristotelianism prevailed completely. Manuel felt obliged to revisit the dispute and reject Plethon's Platonism and Pagan polytheism and to show the alleged impiety of two major late Byzantine thinkers (Plethon and

Bessarion) who are accused to have Proclus as their guide (Mamoni 1986, 1990).

What is philosophically intriguing is that Manuel while falsely accusing Bessarion for polytheism, he developed subtle theological argumentation concerning the Orthodox dogma that involve philosophy and many references to or quotations from Platonic, Aristotelian, and Proclean texts. Philosophy once again is enlisted to serve theology.

Through his activity at the Patriarchal Academy (an institution that remained a point of reference for the intellectual life of the Orthodox people for centuries), Manuel reaffirmed the domination of Aristotelianism in Renaissance and Modern Greek philosophy –until the Enlightenment. Manuel was the first anti-Latin Eastern theologian of the new era, perhaps the most notable Greek scholar left home in the period between 1480 and 1530 and can also be regarded as one of the first Modern Greek thinkers.

Abstract

Theophilos Korydaleus is a seminal Greek scholar of the seventeenth century. He was a key figure in the so-called Neohellenic philosophy. He was a Neo-Aristotelianist, and his

philosophical works include commentaries on Aristotle's treatises but also original treatises, letters, and speeches. Besides his scholarly activities, he served as a monk and Archbishop of Nafpaktos and Arta. He taught philosophy at various schools in Europe and Greece, while he contributed decisively to the renewal of philosophical studies at the Patriarchal Academy in Constantinople.

Biography

His original surname was Skordalos, or Korydalides, as it was written in the records of the Greek College in Rome Sant'Atanasio (Pontificio Collegio Greco), founded by Pope Gregory XIII (1502–1585). Most probably, he adopted the name Korydaleus from his birthplace, Korydallos, a suburb of Athens. Korydaleus studied philosophy and theology in the Greek College in Rome from 1604 to 1608. After his studies at the Greek College in Rome, he attended courses (1609–1613) at the University of Padua, as a student of the Neo-Aristotelian philosopher Cesare Cremonini (1550–1631).

After his appointment as Director of the Academy of the Ecumenical Patriarchate by Patriarch Cyril in 1622, he introduced and implemented a new educational program (1622, 1625–1628, 1636–1640) focusing on the teaching of philosophy and not on grammatical lessons or theology.

He served as a teacher of philosophy in the most famous Greek schools of his time: apart from the Academy of the Ecumenical Patriarchate in Constantinople (1622, 1625–1628, 1636–1640), he taught in the Greek School in Venice (1608–1609), in Athens (1613–1619, 1642–1646), Kefalonia (1619–1621), and Zakynthos (1621, 1622, 1623, 1628–1634).

For a few years, he served as a monk. His revolutionary ideas were manifested in a speech he gave at Constantinople, on the occasion of the enthronement of the new Patriarch. The audience was outraged by the content of the speech, because the attendees thought that he expressed heretical views. He was obliged to seek asylum in the house of Demetrios Ioulianos. In 1640 he rejoined the clergy and became Archbishop of Nafpaktos and Arta. Finally, he retired to Athens, where he continued to teach until his death in 1645.

Heritage and Rupture with the Tradition

Korydaleus is a key figure in Neohellenic philosophy (modern Greek philosophy) due to his reappraisal of Aristotle. He transferred to Greece the Paduan Neo-Aristotelian, particularly Cesare Cremonini's approach (1550–1631).

In particular, Korydaleas perceives physical science as independent from metaphysics or theology, based on its own principles and oriented toward the understanding of passions. Actually, the philosophy of science is opposed to theology, because it is not based on religious faith or revelation but on human reason. This distinction is based on the doctrine of double truth, according to which there are two kinds of truths, who exist independently of each other. The theological truth concerns things supernatural, things which are not subject to generation and destruction, while the philosophical truth concerns natural things and their causes. Korydaleus' Neo-Aristotelian view of creation is opposed to the conservative theological doctrines, according to which philosophy of science is ancilla of the Christian faith. Thereby Korydaleus attempted to liberate philosophy from theology and natural philosophy from metaphysics. He refused to subjugate his Neo-Aristotelianism to theology and defended it from the attacks of conservative scholars.

Innovative and Original Aspects

Theophilos Korydaleus is well-known as a proponent Neo-Aristotelianism. Philosophy, according

to Korydaleus, is not equivalent to metaphysics or first philosophy; it includes all the sciences in general. Therefore, it is divided into many fields, constituting a variety of sciences.

Korydaleus defended a moderate Aristotelianism, which he defines as knowledge of things divine and human, as the perfection of human mind, and as the cause of happiness. His work includes commentaries on Aristotelian texts and original philosophical treatises. Actually, Korydaleus' reputation, especially for his commentaries on Aristotle, stems from his attempt to explicate complex philosophical views to teachers and students. He published the *Prooimion eis apasan tin tes Logikis Pragmateian* (*Introduction to the whole Treatise on Logic*) dialogue, addressing all the potential lovers of philosophy. Following in the footsteps of the long-lasting tradition of Greek commentators of Aristotle, he opened new paths. His philosophical stance was progressive, given that he lived in a world where religion dominated the intellectual circles. Korydaleus' double break with the Scholastic readings of Aristotle is reflected in his philosophical method. In his commentary on *Meta ta Physica* (*Metaphysics*), he followed the tradition of Alexander of Aphrodisias, Simplicius, and others by commenting on every line of the text. On the other hand, in his commentary on *Physica* (*Physics*) entitled *Eisodos Physicis Acroaseos kat' Aristotelin* (*Access to Physics according Aristotle*), he adopted a less traditional method, according to late Renaissance taste.

The Orthodox reception of Korydaleus' commentaries on Aristotle (*Meta ta Physica*, *Peri geneseos kai fthoras*, *Peri Ouranou*, *Peri Psychis*) (*Metaphysics*, *On Generation and Corruption*, *On the Heavens*, *On the Soul*) was ambiguous. For a long period, they were used as the main texts in the Greek Church schools, whereas Korydaleus' main goal was philosophy's emancipation from scholasticism. Apart from Korydaleus' commentaries on Aristotle in his works include the Aristotelian-directed *Ekthesis kat' epitomin logikes pragmateias* (*Compendium on Logic*), *Ekthesis Rhetorikes* (*Rhetoric's Composition*), and *Diairesis tes Poiitikes kai ta meri tes* (*Divisions of Poetics Ars Poetica and its Parts*). Furthermore, he composed

Epistoles on the Procession of the Holy Spirit only from the Father and *Eulogies* (*Epikideioi Logoi*).

Of particular interest are his *Synopsis eis Geographian* (*Synopsis on Geography*), *Peri Astrolavou* (*On Astrolabe*), *Apokrisis pros tous zetesantas ten prognosin tou aeros* (*Response to those who asked for the Air Forecast*), and *Peri gnoseos ton mellonton* (*On knowing the Future Events*). His treatises on geography and astronomy derive from his Ptolemaic studies in Italy (Padua). Although Ptolemaic cosmology was supported by the Catholic and Orthodox Church due to its geocentrism, which amplified the significance of God's presence on Earth, his aforementioned works on geography and astrology proved the extent of Paduan influence.

Impact and Legacy

Korydaleus' contribution lies in the renewal of Aristotelianism, in such an extent that his Neo-Aristotelianism is called in Greece Korydallism. The work of the Greek philosopher influenced education for at least 150 years. Korydaleus' innovative approach of natural philosophy contributed to the separation of philosophy from theology and to the development of a secular scientific research.

Therefore, the philosophical and educational innovations of Korydaleus contributed to the reconstruction of Aristotelian thought. The intentional return to the direct study of Aristotelian texts contributed to the enrichment of Neohellenic philosophy.

Abstract

John Kottunios, Doctor of Medicine, Philosophy, and Theology, was a late Renaissance scholar. He was actively committed to the philosophical and scientific debates of his time as well as to the humanist educational ideal. An exponent of late Scholasticism, he distinguished himself as translator and commentator of Aristotle. In his writings, he was particularly engaged in harmonizing Aristotelian and Catholic ethics and in discussing novel astronomical knowledge.

Alternate Names

[Cottunio, Giovanni](#); [Kottounios, Ioannis](#)

Biography

Born into a noble family in Macedonia, Kottunios moved to Italy at a young age. In 1605 he was admitted to the College of St. Athanasios in Rome, where he received a degree in philosophy and theology (Tsirpanles

1971). Kottunios then became a teacher of Greek grammar in the same institution while establishing relations with other scholars like Leon Allatios (1586–1669) and Leonardo Philaras (1595–1673). Beginning in 1613 he begun studying medicine in Padua and in 1615 was promoted to doctor. Shortly afterward Kottunios moved to Bologna to take up the chair of Greek letters (1616–1629). In 1628 he had his first work printed, *De triplici statu animae rationalis* (On the triple state of the rational soul); from 1629 to 1632, while he was a lecturer in philosophy, Kottunios published the *Lectiones Ioannis Cottuni Verensis* (...) in *primum Aristotelis librum de Meteoris* (John Kottunios' lessons from Verroia in Aristotle's first book on Meteors, 1631). In 1632 he was appointed professor of philosophy at the *Studium Patavinum*, the most renowned center of Aristotelianism alongside the Bologna University. Until his death in 1657, Kottunios composed four peripatetic *Commentarii* (1648–1657), a collection of Greek epigrams with Latin translations (1653), and a treatise on the epigram composition (1632), along with other minor works (two treatises for educational proposes, 1635/posthumous, 1669; three *Orationes*, 1638). In 1653, he founded a seminar for the education of Greek pupils, the Kottunian College.

Heritage and Rupture with the Tradition

During the late Renaissance, the interpretation of Aristotelian psychology continued to be controversial, though it evolved in increasingly syncretizing directions. Drawing on fine philological reasoning, Kottunios contributed to this long-standing philosophical debate. In *De triplici statu anima rationalis*, where he upholds the thesis of the immortality of the soul, he advocates an in-depth philological analysis of Aristotle. In the Greek College of St. Athanasios, home to many pupils from the Greek East, he cultivated a firm adherence to the Catholic doctrine and Thomistic philosophy. Thus, distancing himself from Zabarella's and

Pomponazzi's views, in his peripatetic writings, he also proved to be an advocate of Thomism, a philosophical system which enabled the synthesis of Aristotelianism and Christian principles. Theological and philosophical concerns led Kottunios to counter novel cosmology, which he examined extensively in his *Lectiones* (Guerrini 2008).

Innovative and Original Aspects

Long neglected by scholarship, recent studies have revalued the role of Kottunios as humanist, at "the forefront of European humanism in its later stages" (Karamanolis 2003), and as "original translator and commentator" of Aristotle (Fyrigos 2001). Latest reappraisals of Kottunios' work have been centered around its political content (Syros 2010).

Impact and Legacy

In the eyes of the proponents of the novel experimental science, Kottunios epitomized traditional knowledge, coincident at that time with peripatetic and biblical thought. In a letter addressed to Galileo, the mathematician Bonaventura Cavalieri described Kottunios as a "simple peripatetic philosopher" (Campori 1881). Modern scholarship on Renaissance philosophy is aligned with this evaluation. However, to the extent that "his work was integrated into Paduan Aristotelianism" (Karamanolis 2003), he became interested into new scientific views cultivated in Padua *Studium*, thus reflecting, in many respects, the spirit of his time (Bovo 2015). While Kottunios critically discussed and disseminated new ideas through his writings, Galileo proved to be eager to learn from Kottunios' work. Kottunios' legacy is characterized by the foundation of the Greek College as well as by his contribution to late Scholasticism. Some commentaries were translated into Arabic by Es'ad Yanyavī (d. 1722) in the decades following his death (El-Rouayheb 2008, 205).

Koursoulas, Nikolaos

Born: ci. 1602

Died: 1652

Dimitrios Paradoulakis
Hamburg, Germany

Abstract

Greek Orthodox monk and commentator of Aristotle, immune and uninfluenced from the philosophical thought of Theophilos Corydaleus and his disciples.

Biography

Born in Zakynthos around 1602, Nikolaos Koursoulas studied in 1616 at the Pontifical Greek College of Saint Athanasius (Podskalsky 2005: 311–313). Having signed in 1622 as a student of the College a confession of faith to Roman Catholicism – which he later denounced – he attended a 3-year course in philosophy and theology at the University of Padua obtaining the title of the Doctor of Sciences (philosophy and theology) in 1625. He immediately returned to his homeland and was ordained a monk. During his lifetime, Koursoulas made two attempts, both of which proved abortive, to occupy higher ecclesiastical offices. The first took place in 1636 when he claimed the throne of the Patriarchate of Alexandria, but he was undermined by the Dutch representatives of the city; the latter demanded that the Zakynthian cleric accepts the Calvinist doctrine, something that Koursoulas opposed to. In January 1637 he was appointed for a year as a teacher of the Latin language in Corfu, an occupation which he followed again in 1645, this time in the neighboring town of Ioannina. His second attempt to occupy a supreme ecclesiastical office took place a year later (1646) when he put candidacy for the archdiocesan throne of Zakynthos and Cephalonia, without again achieving his goal. Dejected he retired to Mount Athos, where he died in 1652.

Impact and Legacy

The writing production of Nikolaos Koursoulas is concentrated on philosophy and included four treatises on the Aristotelian corpus (Legrand 1896: 261–268). They all followed the established in the author's time commentary tradition and were related to Stageirites' teaching on Physics (*Physica*, *De Caelo*, *De Generatione et Corruptione*, *De Anima*). Koursoulas repudiated the materialist interpretation of Aristotle from the School of Padua. He appeared vertically opposed to the Renaissance philosophers known as the *Alessandristi*, the supporters of the philosophical theses by Alexander of Aphrodisias, and their efforts for the disengagement of the Aristotelian philosophy from the medieval – Scholastic tradition. In the introductions to his philosophical treatises, Koursoulas accused Alexander of Aphrodisias of rejecting the immortality of the soul and of questioning the doctrine later accepted by the Church on the creation of the universe. The Zakynthian cleric proposed as an alternative interpretation of Aristotle the one promoted by the Neoplatonist Simplicius. Although Simplicius was also presented as a defender of “pagan traditions,” Koursoulas considered him more correct than Alexander and the other commentators of Aristotle, as his philosophical teaching did not collide with Koursoulas' religious beliefs regarding the immortality of the soul and the creation of the universe. As a result, in his commentaries on Aristotle, Koursoulas created a conscientious counterweight to the parallel work of Theophilos Corydaleus and the School of Cesare Cremonini. His fundamental difference from Corydaleus was his persistence and credence to his religious principles and teaching, in comparison to the latter's radical Paduan Aristotelianism. The Zakynthian cleric did not appreciate the effort of the Athenian philosopher and his followers to the genuine interpretation of the Aristotelian texts and denied the Corydalan thesis in favor of a strict separation of philosophy and theology. At the same time, he stood against the rejection of the Scholastic commentary tradition, as he supported in his unique theological

treatise entitled *Synopsis of the Holy Theology Composed for the Benefit of the Orthodox Intellectuals* (Σύνοψις τῆς ἱερᾶς θεολογίας φιλοπονηθεῖσα εἰς ὠφέλειαν τῶν ὀρθοδόξων φιλομαθῶν). In the latter, Koursoulas characterized the Scholastic theology and its various schools as not necessary but useful, and he praised their logically structured and gradually evolving method. In contradiction with Corydalleus, Koursoulas did not accept the belief of the “double truth” (*doppia verità*), and by remaining a tenacious follower of the doctrines of the Church, he resulted in subverting the philosophical reasoning into the Christian faith. Being a staunch supporter of the Greek Orthodox faith, Koursoulas defined the Christian teaching as the only possible framework in order for someone to philosophize. In his writings he promoted the truth of Christian thought and the obligation of philosophy to serve it.

Kristeller, Paul Oskar

Born: May 22, 1905 (Berlin)

Died: June 7, 1999 (New York City)

Brian Jeffrey Maxson

East Tennessee State University, Johnson City, TN, USA

Abstract

This entry briefly examines the major contributions of Paul Oskar Kristeller to the intellectual history of the Italian Renaissance. It focuses on Kristeller’s two most significant cataloguing and editorial projects in addition to the continuing impact of Kristeller’s own scholarship on the history of Renaissance thought.

Biography

Paul Oskar Kristeller fled Germany and then Italy for the safety of the United States in the late 1930s. In 1939, Kristeller found an academic home at Columbia University where he oversaw multitudinous major research projects and graduate students over a 60-year career (Monfasani 2016). His highly influential work focused on the intellectual history of the Italian Renaissance.

Kristeller’s most significant contributions were to the study of the classical tradition and of Renaissance humanism. In both areas, Kristeller argued that the lack of good editions of even major works by major writers from the period impeded the ability of historians to accurately assess the contributions of Renaissance thinkers. Thus, in addition to numerous investigations and editions of the writings of Renaissance authors, Kristeller spearheaded two major projects aimed at cataloguing what exactly remained from these authors in archives and library special collections. The first of these projects, the ongoing and collaborative *Catalogus translationum et commentariorum*, continues to publish extensive

entries on the history of commentaries, editions, and translations of Ancient Greek and Latin authors published between the end of Antiquity and the end of the early modern period (Kristeller et al. 1960–). The second massive project, the *Iter Italicum*, catalogued thousands of manuscripts and their contents pertinent to the study of late medieval and Renaissance humanism and philosophy (Kristeller 1963–1992).

Beyond these highly influential editorial and catalogue projects, Kristeller's articles and monographs have shaped the intellectual history of the Italian Renaissance and beyond. Kristeller began his scholarly career as an historian of Marsilio Ficino, writing an influential first book on the fifteenth-century's premiere Platonist (Kristeller 1943). But it was undoubtedly in his article-length works, many of which have been republished numerous times in book-length essay collections, that he made his greatest contributions. Kristeller argued against the idea that Renaissance humanists were philosophers with a coherent set of teachings or ideas. Instead, Kristeller argued that the term "humanist" was shorthand used to describe teachers of a quite specific range of subjects – history, poetry, grammar, rhetoric, and moral philosophy. Humanists often sparred with their disciplinary rivals in philosophy, rather than offering a well-defined program to replace their teachings. Although the Renaissance had long been associated with the fifteenth-century revival in Platonic thought, Kristeller demonstrated that Renaissance Platonism coexisted with Renaissance humanism and various philosophical schools. In particular, Kristeller showed that Aristotelianism and the related scholastic tradition continued unabated through the fifteenth century and beyond (Kristeller 1979).

Kristeller's editorial projects and original writings have shaped the intellectual history of the Italian Renaissance for over a half a century. His *Catalogus* project has inspired two generations of, in many cases, the first ever studies of the reception of classical authors in the period between the fall of Rome and the classicists of the eighteenth and nineteenth centuries. It has also brought about similar projects in Italy,

such as the "Il Ritorno dei Classici nell'Umanesimo" project (Albanese et al. 2015). Originally published in six volumes, the *Iter Italicum* project has since been digitized and, without question, remains the foundation for the current explosion of critical editions of Renaissance writings, particularly those originally written in Latin. Kristeller's ideas about Renaissance humanism and philosophy continue to be cited and are largely accepted in the historiography. Only recently have scholars begun to revisit some of Kristeller's many theses. For example, recent scholars have suggested that it may be possible to broaden Kristeller's conception of philosophy outside of narrow metaphysical terms or soften distinctions between vernacular and Latin writings during the period (Celenza 2004; Maxson 2014). But such observations are small in number, and without question Kristeller's writing, cataloguing, and editorial projects have created the modern field of study on Renaissance thought and letters.

Kritoboulos, Michael

Born: Imbros 1400–1410

Died: Constantinople After 1468

Ilias Giarenis

Department of History, Ionian University,
Corfu, Greece

Abstract

Late Byzantine author, scribe, and scholar. He held the position of governor of Imbros in the period 1456–1466 ca. His main work is a historiographical narrative of the years 1451–1467 (*Εὐγγραφή Ἱστοριῶν*); minor works include a prayer to Christ and verses to Saint Augustine. Imitation (*mimesis*) of ancient writers such as Thucydides, Herodotus, Xenophon, Flavius Josephus, Aelius Aristides, and Arrian is combined with a choice of compromise with and accommodation to Ottoman rule and elaborated through a new synthesis of notions regarding history and its evolution.

Alternate Names

[Kritopoulos, Michael](#)

Biography

Late Byzantine author, scribe, and scholar who lived before and after the events of 1453 (Trapp et al. 1976–1996, no. 13817). He was born on the island of Imbros most probably in the first decade of the fifteenth century. He descended from an aristocratic family of the island; he considered Imbros as his fatherland and subsequently called himself *Ἰμβριος* or – in a vernacular version – *Ἰμβριώτης*. Sometimes he also identified himself as an islander: *νησιώτης*. (Andriotes 1929; Talbot 1991; Reinsch 2003)

His family name was *Kritopoulos*, which he changed into *Kritoboulos*, following a fashionable classicizing tendency of the Byzantine Quattrocento. Perhaps that choice was also influenced by the literary personage of appearing in works of ancient historian Xenophon (*Oeconomicus* and *Symposium*), whom he studied and imitated. His literary activity shows that he must have received a good and extensive literary education, most probably in Constantinople. The school in which he studied cannot be firmly established.

Kritoboulos was in friendly terms with a circle of renowned and influential learned men of his era, such as Georgios-Gennadios Scholarios, Ioannes Eugenikos, Georgios Amoiroutzes, and Theodoros Agallianos (Theophanes of Medeia). His contact with the two latter scholars is clearly indicated by a letter of Georgios Amoiroutzes, called “the philosopher,” sent to him around 1470 asking that he passed a critical letter to Agallianos on his work *On Providence* (*Περί Προνοίας*), after making any corrections he thought necessary (Papadopoulos-Kerameus 1884–1888, 24; Eustratiades 1925, 412–413). That testimony attests to the central role that Kritoboulos played within a circle of scholars who operated in early Ottoman Empire, having realized the entirely different situation and having made the critical decision for an accommodation and understanding toward the Ottoman rule (Reinsch 2003).

In late September 1444, Cyriacus of Ancona (Ciriaco de’ Pizziccolli) visited Kritoboulos during a travel on Imbros in search of ancient Greek antiquities. He refers to him by the name “Hermodorus

Michael Critobulus” or simply “Michael Critobulus” and describes him as “a learned man and nobleman from Imbros” (*vir doctus et Imbriota nobilis*) (Bodnar and Foss 2013, 92–93); in a letter to Georgios Scholarios, he refers to Kritoboulos as “your good friend, the most learned of the Imbriotes” (*vir tuus amicissimus et Imbriotum doctissimus*) (letter 17; Bodnar and Foss 2013, 96–97). Most probably the term “Hermodorus,” used only once by Cyriacus, does not reflect an alternative name of Kritoboulos. Rather, it is to be seen as an expression of enthusiasm on behalf of the antiquarian traveller.

Shortly after the Fall of Constantinople, in the summer of 1453, Kritoboulos sent embassies to Hamza Beg, governor of Gallipoli and admiral of the Ottoman fleet, and to the Sultan Mehmed II in Adrianople and arranged for a peaceful surrender of the islands of Imbros, Lemnos, and Thasos, in order to prevent their capture by force. Imbros and Lemnos temporarily came into the hands of the Gattilusio by grants made by Mehmed (Wright 2014).

But in 1456 the Turkish navy intervened, and Mehmed appointed Kritoboulos as governor of Imbros; 4 years later, with the help of Kritoboulos, Ainos, Imbros, Lemnos, Samothrace, and Thasos were granted to Demetrios Palaiologos, vassal of the sultan, whereas Kritoboulos remained in that position most probably until the summer of 1466. At that time, he had to flee to Constantinople after the Venetian occupation of his fatherland. He survived the great plague of the following year, which he was able to describe in his historiographical work, showing an interest – and perhaps an expertise – in knowledge. The last trace is the aforementioned letter which Amiroutzes wrote to him; it can be dated in 1468. Kritoboulos must have died either in the course of that year or afterward.

Kritoboulos’s main work is a historiographical synthesis entitled *Εννῆραφῇ Ἱστοριῶν* (Tomadakes 1953; Reinsch 2003; Neville 2018; Ottenheim 2019), which constitutes a partial account of Mehmed II’s reign (1451–1481). The *codex unicus* which preserves the work is an autograph (cod. *Topkapı Palace Library*, G. İ. 3). It begins with the reign of Mehmed II and is

dedicated to him; it covers the events of the years 1451–1467 and mostly focuses on the Ottomans of the time and their leader. Kritoboulos throughout the *Ενγγραφή* provides a highly positive portrait of the sultan; he praises him for his virtues and compares his deeds even with those of Alexander the Great; as a result, he states that he thought appropriate that his great victories and achievements would be “presented to the Greeks in Greek (*ἐλληνικῶς εἰς τοὺς Ἕλληνας ἐκδοθῆναι*)” and thus were transmitted to the next generations (Reinsch 1983, 4; Tóth 2016).

Kritoboulos also presents the Ottoman sultan as a successor of the Byzantine emperors who ruled in Constantinople, attributes to him the traditional virtues and accomplishments of a Byzantine emperor, and uses the traditional terms *βασιλεὺς* and *αὐτοκράτωρ* when he refers him as “supreme emperor, king of the kings, lord of land and sea by the will of God” (*αὐτοκράτορι μεγίστῳ, [...] βασιλεῖ βασιλέων Μεχμέτει [...] κυρίῳ γῆς καὶ θαλάσσης θεοῦ θελήματι*) (Reinsch 1983, 3). The Ottoman sultan is thus presented as a ruler who has genuinely and effectively inherited and embodies the crucial virtues and skills of the Byzantine emperors, among which the ecumenical character of his *basileia* and the consent by God to the dominance of his power (Koski 2013).

While writing that work, Kritoboulos sought to imitate ancient Greek writers, mostly historians. Thucydides’ work functioned as an important model for him (Mastrodemetres 1961; Reinsch 1983, 48*–54*); not only did he borrow the title of the work (*Ενγγραφή*), and numerous words and expressions, but he also imitated the narrative style of the ancient Greek historian. Furthermore, he followed the main principles of his model in terms of the organization of the historical material. A manuscript with Thucydides’s history which we know that was owned by Kritoboulos has come down to us; it is *Parisinus graecus* 1636, which also bears a small epigram drawn from the *Anthologia Palatina* written by his hands (f. Iv: *κριτοβούλ(ον) γράμμ(α)τ(α)*).

Other Greek and Roman historians, such as Herodotus (Reinsch 1983, 54*–55*), Xenophon

(Reinsch 1983, 55*–56*), Aelius Aristides (Reinsch 1983, 66*–67*), Flavius Josephus (Reinsch 1983, 56*–58*; Kampianaki 2018, 222–227), and Arrian (Reinsch 1983, 58*–66*), were also used as sources and imitated by Kritoboulos, through forms of expression, words, and concepts. Kritoboulos’s strong interest in those ancient authors which he used as models is also indicated by manuscripts copied by him that preserve their texts: cod. *Laurentianus* 70, 32 which preserves the *Histories* of Herodotus; cod. *National Library of Greece* 1064 which preserves Aelius Aristides’s *Panathinaikos* (copied in 1466 or slightly earlier); and cod. *Topkapi Palace Library*, G. I 16, a testimony of Arrian’s work (copied in 1463).

Kritoboulos also wrote minor works which could contribute to a more comprehensive sketch of his intellectual personality: (a) *Prayer to Jesus Christ* (*εὐχὴ Κριτοπούλου τοῦ Ἰμβρίου*; Reinsch 1983, 12*–15*) and (b) *Twelve-syllable verses to saint Augustine* (*στίχοι Κριτοπούλου Μιχαὴλ τοῦ Ἰμβρίου*; Reinsch 1983, 16*). Those verses are perhaps to be seen in connection with Michael’s education and to the interests and priorities of his intellectual circle.

Two works of his are no longer extant: (a) a *Homily in the Passion of Christ* and (b) a *Letter*. Kritoboulos himself also informs us in his text *Ενγγραφή* that he planned to write a special historiographical work on the sultans who exercised power before Mehmed, whose deeds had gradually weakened and conquered the Byzantine territory (Reinsch 1983, 13). It seems that he had not finally had the time to do so.

Heritage and Rupture with the Tradition

Kritoboulos was educated according to the traditional Byzantine intellectual scheme; he thus extensively practiced the method of *Imitatio* of glorious ancient authors, mostly historians, both of the classical and postclassical antiquity. He nevertheless had to operate in an entirely different political, social, and intellectual environment after 1453, which led him to a choice of compromise between Byzantine values and Ottoman ambitions

and realities. His philosophy of history deviates from the traditional Byzantine concept of history as being governed by God's providence.

In addition to divine will, which keeps playing an important role, there is the variable of *τύχη* (luck, good, or bad alike), which according to Kritoboulos's view contributes to the evolution of the historical events (Tóth 2015). In order to explain, and perhaps justify, the Fall of Constantinople and of the Byzantine Empire to the Ottomans, Kritoboulos often employs the idea of *translatio imperii*. In combination with that, the concept of determination of history is also occasionally applied as an explanation of described events. This set of secular ideas functions at a different level of thought, which supplements the metaphysical aspect with the notion of temporality of states and empires in history; that very notion in fact rationalizes and justifies the *translatio imperii* (Moustakas 2011).

Overall, Kritoboulos did not see the Fall of Constantinople as an event which was to be explained as a punishment sent by God to the Byzantines because of their sins; such a concept could not serve the effort made by him – and other scholars – to cooperate with the new rulers of the former Byzantine lands. Kritoboulos opted instead to construe that event as a succession which was fully justified by the concepts of luck, will of God, and *translatio imperii*. The Ottoman sultan was subsequently praised as a legitimate and powerful successor to the most glorious Byzantine emperors; but he was also considered and presented as the heir of many great political leaders of the past, including Alexander the Great.

Kunstkammer

Mark A. Meadow
History of Art and Architecture, University of California Santa Barbara, Santa Barbara, CA, USA

Abstract

In the sixteenth and seventeenth centuries, the *Kunstkammer*, a new form of knowledge-based, encyclopedic collection, emerged in Europe. Although most commonly associated with princely courts, these collections first appeared in the context of German merchant bankers such as the Fuggers of Augsburg and minor nobility such as Wilhelm Werner von Zimmern; the term is also associated with the collections of scholars, naturalists, and physicians such as Conrad Gessner, Olaus Worm, and Bernardus Paludanus. While the contents of individual collections varied widely, *Kunstkammern* typically contained a combination of natural specimens, crafted objects and works of art, technology, and historical and ethnographic materials.

Heritage and Rupture with the Tradition

The origins of the Renaissance *Kunstkammer* were diverse, including both ecclesiastical treasuries (*thesauri*) and secular treasuries (*Schatzkammer*), mercantile collections, and scholarly studies. In addition to ecclesiastical materials—liturgical and other sacred vessels made from precious metals and gems, vestments, illuminated manuscripts, and especially relics and the reliquaries that held them—medieval church treasuries also held historical and rare natural materials, including narwal tusks, ostrich eggs, and coconut shells. Functionally, they served as reserves of economic and spiritual value. In this, they differed little from courtly secular treasuries, which held very similar materials—precious metals in the form of plate, bullion and minted coins, gemstones, coronation and other regalia, and sacred religious materials. Both secular and sacred treasuries were secure spaces containing compact forms of wealth that could be used for ostentatious display but that also could be liquidated when the need arose. Merchants and scholars also required secure spaces for archiving legal and financial documents, as well as securely storing valuables. Originating as lockboxes, these spaces developed into small, securely lockable rooms in the most private areas of a mercantile, scholarly or princely residence (*studioli*), as described by Leon Battista Alberti (1969). These *studioli* or studies, which were utilized for business management and for writing family and personal histories, also held rare objects deemed worthy of safekeeping and contemplation, thus drawing the connection between collections and knowledge production.

Innovative and Original Aspects

Just as the *studiolo* emerged in Italy in connection with urban merchants such as the Alberti of Florence, the transalpine *Kunstkammer* makes its earliest appearance with the merchant bankers of Augsburg in Germany; the first known use of the term *Kunstkammer* (1546) refers to the collections of Raimund Fugger of Augsburg (Meadow 2002). Minor nobility in Southern Germany, including Wilhelm Werner von Zimmern, Ulrich von Montfort, and Wilhelm von Laubenberg, were also important early exponents of the *Kunstkammer* tradition. In the 1550–1560s, great princely houses such as the Bavarian Wittelsbachs, the Austrian Habsburgs, and the Saxon Wettins established *Kunstkammern* as formal institutions (Impey 1985). Showplaces of wealth, knowledge, and power, *Kunstkammern* functioned as forms of princely representation (Kaufmann 1978). In the later sixteenth and seventeenth centuries, the phenomenon became more widespread, reaching Spain, France, the Low Countries, Scandinavia, England, and, eventually, Russia, among other places.

From the time of its adoption by the great princely houses, the *Kunstkammer* is distinguished by several features: the construction of dedicated storage and display facilities; a greater degree of permanence through designating certain materials as inalienable; efforts toward systematic organization by material, form, and function; linkages between the collections and practical workshop spaces for alchemical distillation, metalworking, glassblowing, or woodturning; and, more generally, the production of practical knowledge. In 1565, the Flemish physician Samuel Quiccheberg wrote a treatise on *Kunstkammern*, the *Inscriptiones vel tituli theatri amplissimi*, which proposes that the *Kunstkammer* assists in the state administration of the economy, the military, religion, and scholarship (Meadow and Robertson 2013). Quiccheberg defines the *Kunstkammer* as an aid to the ruler's *prudentia* (Aristotelian *phronesis*) or practical knowledge.

Impact and Legacy

The *Kunstkammer* as an institution of research and learning is recognizable in both Francis Bacon's *Salomon's House* (Bacon 2002) and Gottfried Leibniz's *Theatrum naturae et artium* (Bredekamp 2004). Although *Kunstkammern* persisted into the eighteenth century, their functions as research and educational facilities were eventually ceded to public museums and universities. Indeed, former *Kunstkammern* often established the core collections of modern universities, including Oxford University and Humboldt University. Similarly, the heterogeneous collections of *Kunstkammern* formed the basis of many modern museums of art, natural history, ethnography, and technology.

Kyminites, Sevastos

Born: 1632

Died: 1702

Dimitrios Paradoulakis
Hamburg, Germany

Abstract

Eminent teacher and Aristotelian commentator active in the Ottoman Empire of the late seventeenth century.

Biography

Born in 1632 in the village of Chotzi or Kymina, Sevastos Kyminites was taught his first letters in his hometown of Trabzon, Asia Minor. He then proceeded to higher studies at the Patriarchal Academy of Constantinople under the famous

scholar Ioannis Karyofyllis, director of the school for the period 1641–1665, and the prominent physician and later Dragoman of the Porte Alexander Mavrocordatos (1636–1709) (Karanasios 2001; Mitsoglou 2007). During his studies in Constantinople, Kyminites perfected his knowledge in philology, philosophy, epistolography, and dogmatic theology. In 1671 he succeeded Mavrocordatos in the direction of the Academy, where he taught grammar, rhetoric, Aristotelian philosophy, and theology until his resignation in 1682. Being continually attacked by the conservative circles of Constantinople because of the relationship with his teacher but intellectually controversial Karyofyllis, Kyminites rejected an invitation to become the director of the Greek School of Moscow (Mitsoglou 2007). Instead, he decided to return to his hometown of Trabzon, where he was appointed in September 1682 a schoolteacher of the newly established *Phrontisterion*. Remaining in his post until 1689, he contributed due to his well-founded philological and philosophical training to the evolution of the institution to a school of high intellectual standards. At the same time, he developed intense pro-Orthodox activity, successfully tackling the efforts of the Catholic missionaries to convert the local population to Roman Catholicism (Kollia 1977–1978, 280–306). After the invitation by the Prince of Wallachia Constantin Brâncoveanu (1654–1714), Kyminites left Trabzon at the end of 1689 to settle in Bucharest and be appointed director of the local Princely Academy (Academia Domnească de la București). As a scholar of recognized educational abilities, he worked with perseverance for the pedagogical revival of the Greek studies. During his stay in Bucharest, he put at the disposal of the ruler texts that would enable him to come into contact with both the ancient Greek and Byzantine thought. In this context he composed treatises of political instruction (speeches and encomiums), always aiming at indicating to Brâncoveanu the characteristics of the fair Prince and the correct way of exercising power. Alongside, he placed his intellectual interests in the expectations and the purposes of the Church, being considered a profound authority of the Greek Orthodox literature and

ecclesiastical tradition (Mitsoglou 2007). Sevastos Kyminites served as the director of the Academy of Bucharest for 13 years until his death in 1702.

Impact and Legacy

The extensive educational and writing production of Sevastos Kyminites is divided into six categories based on their content: grammatical, rhetorical, philosophical, theological, homiletics, and correspondence. Concerning his lessons on the art of rhetorics (secular and ecclesiastical), the scholar from Trabzon proceeded to its systematical teaching based on the Aristotelian doctrines and the corresponding commentaries by contemporary early modern Greek scholars, mainly Gerasimos Vlachos, Georgios Sougdouris, and Alexander Mavrocordatos. A large amount of his writings (a total of 17 works) belong to the field of logic and philosophy. Kyminites composed introductions and paraphrases: (a) in the Aristotelian corpus (*Organon*, *Physica*, *De Caelo*, *De Anima*, *Metaphysica* and *Ethica Nicomachea*), (b) in Alexander's of Aphrodisias *On Topics*, and (c) in Theophilus Corydaleus' *On the Soul* and *On Generation and Corruption*. Most of his philosophical production derived from his teaching courses at the Patriarchal Academy in Constantinople since his philosophical method was influenced by the system of Corydaleus, Karyofyllis, and Mavrocordatos. During the 11 years of his stay as

a teacher in the Ottoman capital, he followed a 3-year philosophical curriculum: in the first year he taught Logic, in the second year Natural Philosophy and lessons on the Soul, and in the third year Metaphysics. Kyminites followed on a first level the model of Corydaleus in distinguishing his philosophical and theological knowledge, and on a second level he proceeded to the recombination of the two perceptions (secular and religious), with his ultimate goal to be a modern balanced teaching of the classic and Christian literature (Podskalsky 1988, 344–350; Karanasios 2001; Mitsoglou 2007).

L'Alemant, Adrien

Born: Sorcy-sur-Meuse (France), 1527

Died: Paris, 1559

Véronique Montagne

CNRS, BCL, UMR 7320, 98 Bd Edouard Herriot,
Université Nice Sophia Antipolis, Nice, France

Abstract

Adrien L'Alemant was a doctor, translator, and author of medical texts (theoretical and practical) living in Paris in the early sixteenth century.

Alternate Names

[Alemanus, Adrianus](#)

Biography

Adrien L'Alemant studied medicine in Paris, where he received the doctor's cap under Jean de Gorris. From 1558 to 1559, he represented the nation of Germany in the medical college of Paris's Faculty of Medicine, which was responsible for voting for and appointing the dean (Concasty [1964](#)).

Works

Well-versed in Latin and Greek, Adrien L'Alemant published two treatises by Hippocrates in 1557 in bilingual editions (with the Greek text opposite the Latin translation) (Hippocrate [1557a, b](#)).

He also wrote several books on logic, like *De optimo disputandi genere libri III* (Paris, Jacques Gazeau, [1546](#)) and *Ars parva* (Paris, Thomas Richard, [1549](#)), which is the Latin translation of his *Dialectique en François pour les barbiers et les chirurgiens, composée par maistre Adrian l'Alemant docteur en medecine à Paris* (published by Thomas Richard in [1553](#)).

Following the recommendations of Galen, whose influence – in particular his methodological approach to science – remained significant in the Renaissance, Adrien L'Alemant emphatically argues in his Latin and French dialectics that mastering logic is essential for a man of science who wants to build a valid argument.

His *Dialectique en françois* is part of a close paradigm of works on medical logic written in the vernacular; the title of the book and the introduction to the text, which addresses the reader, clearly demonstrate this choice. This corpus of works helped spread the idea of method in France – a concept that was theorized by Petrus Ramus and would later lead to Descartes's approaches. Adrien L'Alemant's *Dialectique* – like *La philosophie rationale, vulgairement appelée*

Dialectique pour les chirurgiens françois et autres amateurs de la langue françoise by Jean Eusèbe (1566) and *Dialectique françoise pour en peu de temps et avec grande facilité apprendre l'art et science de bien disputer: en la faveur et grace des compaignons chirurgiens et autres studieux de ladicte science* by Pierre Bertrand (1571) – marks an epistemological turning point in this “prescientific” era (Bachelard 2004; Montagne 2015).

Adrien L'Alemant also wrote *Traicté de l'origine, cause, signes, preservation et curation de la peste*, now lost, which was published without a date by Jean Ruelle, who was active in Paris from 1538 to 1571. It is part of a body of works on the dreaded plague epidemic, which, as early as the mid-1550s, were characterized by a logical method of presenting data, with the definitional approach at the center.

La Boderie, Guy Lefevre de

Born: Sainte-Honorine-la-Chardonne, August 09, 1541

Died: Sainte-Honorine-la-Chardonne, June 10, 1598

Luisa Brotto

Istituto Nazionale di Studi sul Rinascimento,
Florence, Italy

Abstract

Guy Lefèvre de La Boderie was a renowned orientalist philologist, a translator of ancient and modern languages, an expert in mystical and especially cabalistic doctrines, and a poet. His works were crucial to the spread of Neoplatonic and cabalistic motifs within French Renaissance culture. Influenced by Guillaume Postel, he fostered peaceful dialogue and gradual integration of all religious creeds in light of a cabalistic interpretation of Catholicism.

Alternate Names

[Boderianus, Guido Fabricius](#)

Biography

Guy was born and died in his family estate in Normandy. After studying philosophy and mathematics at the University of Caen (1556–1561), Guy moved to Paris and learnt Hebrew at the Collège Trilingue. Guy also started studying ancient Syriac as an autodidact, and he considered his achievements on this matter to be God-given. He became acquainted with the philologist and cabalist Guillaume Postel, whose

influence on Guy's work is unanimously recognized by scholars. Although a precise date has not been established, the two probably met for the first time in Paris in 1553 (Secret 1969). In 1566, Guy worked on an edition of the Syriac New Testament. Thanks to Postel (Wilkinson 2007), he came into contact with printer Christophe Plantin and was included as a contributor in the Antwerp Polyglot Bible project financed by Philip II of Spain. At that time Guy also completed a Syriac dictionary. In 1571, his first poetical work, *l'Encyclie des secrets de l'éternité*, was released. The poem constituted a peculiar case within the French genre of *poésie scientifique* that flourished during the late sixteenth century (Gorris 2014): to demonstrate the existence of God and the immortality of the soul, Guy illustrated the natural world in light of a divine truth attainable through cabalistic principles.

After spending a brief period in Louvain, in 1572, Guy returned to Paris, thus witnessing a particularly difficult phase of the French Wars of Religion. He became secretary and interpreter of the Duke of Alençon, a prominent figure within the *politiques* faction, whose aim was to guarantee national unity by prioritizing civic prosperity over religious matters. Guy's host in Paris was Jean Desprez, probably a member of the *Familia Charitatis* (such as the printer Plantin). This religious congregation intended to reduce religious conflicts by bringing Christian faith back to some universally valid *fundamentalia* (Vasoli 2009). Although his religious views differed from those of both *politiques* and familists, Guy shared with them the purpose of overcoming religious disagreements to achieve nonviolent coexistence. In 1578, Guy released his translations of Marsilio Ficino's *De christiana religione* and Giovanni Pico's *Oratio de hominis dignitate*. He also translated into French Ficino's *De amore* and Francesco Zorzi's *De harmonia mundi*. In 1581, translations of Ficino's *De vita libri tres* and Cicero's *De natura deorum* were published. Thus, Guy definitely contributed to promoting Neoplatonism and Christian Cabalism among French intellectuals. These philosophical and spiritual sources influenced Guy's poetical works, such as *Diverses meslanges*

poetiques, *Hymnes ecclésiastiques*, and especially *La Galliade*, all published in 1578. After working within the royal court for several years, in 1583, he retired to Normandy.

Heritage and Rupture with the Tradition

Guy appears to have shared some of Postel's prophetic and eschatological ideas, namely, that the end of times was approaching and that soon universal restitution would take place. The variety of the world would thus return to its primal perfection and rejoin its divine unity. In Guy's view, the unification and reconciliation of all beings had to be initiated by men in the present time through the practice of arts, sciences, and, most of all, the study of language. A careful search for the Jewish etymologies of modern and ancient words could restore the pristine transparency of human expression (Roudaut 1992; La Boderie 1994). A comparative analysis of the languages of the sacred texts was a crucial step toward this end. Guy stressed the relevance of the French people and culture within the process of universal reunification.

Innovative and Original Aspects

In his poems, and especially *La Galliade*, Guy argued that the French Catholic monarchy should pursue, promote, and accomplish all humankind's political and religious unification. While illustrating a circular and yet progressive conception of history, he attempted to show that France is the true heir of the ancient Jews. After the fall of Babel, they kept using the language of Adam, capable of expressing the truth directly. Renaissance France appeared to be the ultimate expression of a long sapiential tradition originated by Noah, passed on to the Gauls, and transmitted through the work of the humanists. In the dedicatory epistle of the 1584 edition of the Syriac *Novum Testamentum*, Guy invited the king of France to support an Arabic edition of the Bible, so to encourage nonviolent

conversions to Catholicism (Wilkinson 2007). In 1574, he had translated into French (following an Italian version) the *Confusión de la secta Mahoméctica* by Juan Andrés (1515).

La Boétie, Étienne de

Born: 1530, Sarlat

Died: 1563, Germignan

Laurent Gerbier

Centre d'Études Supérieures de la Renaissance,
Université François Rabelais, Tours, France

Abstract

Born in 1530 to a family of wealthy merchants in Sarlat, Périgord, Étienne de La Boétie was

trained in the humanities and law and became a councilor in the Parlement of Bordeaux, where he met Michel de Montaigne, who was to become his closest friend. He died in 1563 near Bordeaux, at the age of 33. His famous *Discourse on Voluntary Servitude*, probably completed around 1554, was only published in 1574, in a Protestant collection of anti-monarchical essays. However, the critical analysis of domination developed by the *Discourse* does not concern the sole French Catholic monarchy: La Boétie rather expands the classical analysis of tyranny and applies it to any form of individual power. This political radicalism defined the way La Boétie was to be read and published from the sixteenth century to the present: the *Discourse* offers a model to link the rejection of any kind of servitude with the constant reminder of the part the subjects themselves always take in it. Indeed, by forging the concept of “voluntary servitude,” La Boétie underlines that no individual may ever reduce any people to servitude without their active consent. He then endeavors to understand the root of this actual corruption of human nature: “custom” is the force that led humanity to forget its native impetus toward freedom, and friendship seems to be the only antidote against the habituation to servitude.

Biography

His father Antoine de La Boétie, a civil magistrate from a wealthy family of merchants of the Périgord, had married Philippe de Calvimont, whose father and brother had both been appointed as presidents of the Parlement of Bordeaux. Their son Étienne was born in Sarlat in 1530; he was trained in the humanities in Sarlat and, maybe, in a Parisian college, before receiving his law degree at the University of Orléans, in 1553. A brilliant student, he became a councilor in the Parlement of Bordeaux as early as 1554, and the same year he married Marguerite de Carle, a young widow

from a family of noblemen and magistrates. In Bordeaux, he developed a close friendship with a young colleague, Michel de Montaigne, who was later to celebrate his friendship with La Boétie in his *Essays*. Beyond his career as a legal officer in Bordeaux, La Boétie took part in several diplomatic negotiations between Catholics and Protestants in Périgord and Guyenne during the early 1560s. In 1563 he died in Germignan, near Bordeaux, from sudden dysentery. Montaigne relates his friend's last days in a letter to his father.

Étienne de La Boétie is the author of several pieces of French and Latin poetry and of a *Mémoire sur la pacification des troubles* (*Report on the pacification of the disorders*). He also translated Xenophon's *Œconomicos* (*La Mesnagerie de Xénophon*) and Plutarch's *Marriage Advice* (*Les Règles du Mariage*). But La Boétie is best known for his *Discours de la Servitude Volontaire* (*Discourse on Voluntary Servitude*), maybe written as early as 1548 (according to Montaigne), but obviously completed in 1553–1554, when his dedicatee Guillaume de Lur left Bordeaux to Paris, offering to La Boétie the opportunity to take his seat at the Parlement of Bordeaux.

While the *Discourse* could be read as one of the many anti-tyrannical treatises produced during the fifteenth and sixteenth centuries, La Boétie actually breaks up with this tradition: his point is not against tyranny in a classical sense, but against any kind of individual domination among men. Abandoning the classical debate about the best political regime, La Boétie deems them all corrupted, as they all proceed from a corruption of men's natural freedom. But this corruption would be impossible without the cooperation of the people themselves: they may be subject to domination if and only if they willingly adhere to their own servitude. The first aim of the *Discourse* is to evidence this scandal of voluntary servitude; its second aim is to understand the cause of this situation. After having rejected many of the classical causes of servitude and domination (Aristotle's natural hierarchy as well as Augustine's original sin), La Boétie eventually discovers the one power

that causes humans to get used to servitude, which is “la coutume” (custom).

After a thorough analysis of the way custom operates and ruins the desire for freedom which can be observed in any living creature, the *Discourse* ends up with a clever and precise condemnation of the “chain of tyranny”: the domination is indeed never based upon a single individual, as smart or strong as he may be. Around the tyrant lay circles of relatives, servants, and councilors, who act as relays and transmit the power of tyranny to a continuous chain of subjects. Thus, the chain of tyranny holds a whole society that lends its collective power to one man alone. But the purpose of the *Discourse* is not to incite revolt against the power, but rather to challenge us, its readers: are we able to resist the power of custom and to refuse to take part in the mechanism of tyranny? Are we able to recall our native freedom and build upon it uncorrupted moral and social links among us?

Though he originally intended to publish his friend’s *Discourse* in the center of the first book of his *Essays*, following the essay I, 28 “On friendship,” Montaigne eventually abandoned this project, as the Protestants had seized upon the *Discourse* and published it in two collections of anti-monarchical texts, in 1573 and 1574. From then on, the *Discourse* has constantly been published in highly ideological contexts, continuously demonstrating its strength as a keen and virulent critic against any kind of political domination.

La Framboisière, Nicolas Abraham de

Born: 1560, in Guise

Died: 1636, in Reims

Violaine Giacomotto-Charra

Université Bordeaux Montaigne, UFR

Humanités, Pessac, France

Abstract

Nicolas Abraham de la Framboisière was one of French King Henry IV's physicians and advisers. Along with other doctors at the French court, among whom Joseph du Chesne, he defended a moderate form of Paracelsian medicine rooted in the Hippocratic-Galenic tradition. He also penned a number of philosophical texts, from his first years as a student onward.

Alternate Names

[Frambesarius](#)

Biography

Son of a surgeon (Hector Abraham – Abraham being his real name, as Stefen Bamforth explains (Bamforth 2010)), de La Framboisière studied medicine with Gourmelen and Riolan between 1582 and 1585, in Paris, where he seems to have established himself as early as 1579. In 1587 or 1588, he qualified as a medical doctor at the faculty of medicine in Reims. He became one of French King Henry IV's doctors in 1600, and went on to officiate under Louis XIII, before becoming a Professor at the Collège Royal and professor and doyen of the Faculty of Medicine at Reims University. He devoted also an important part of his career to military medicine and became “premier des

Bendes de France” (Chief Medical Officer) in 1610 (Bamforth 2010).

Works

De La Framboisière was a physician first and foremost, and the vast majority of his work comprises medical texts, but he also studied philosophy. His interest in philosophy, especially in ethics, sprang from his conception of medicine as surpassing a purely medical framework. Hence, his first book, published in 1587, was a philosophical treatise: *Methodicae institutiones Philosophiae rationalis, naturalis, moralis*. Medicine was an integral part of his general overview of man, a stance to which the internal organization of his *Œuvres complètes*, published in French in 1613, bears ample witness (he wrote only in Latin until 1595). His works are classed in such a way as to reflect the political structure of society: “principality” (*Principautez de l'homme*: “principality of Man”). “Government” (*Le gouvernement nécessaire à chacun pour vivre longuement en santé*, – a branch of health), “Laws” (*Les loix de la médecine* – “The Laws of Medicine”), “Ordinances,” “Crown,” “State”. . . . La Framboisière adopts ideas also prevalent in the work of Joseph Du Chesne and the Paracelsian physicians in general. He firmly believes that all physicians should receive proper training in philosophy and defends a universal vision of medicine in which the physician, an expert in a variety of disciplines, also cares for the soul (*L'Estat des vertus desquelles doit estre ornée l'ame chrestienne pour vivre eternellement bienheureuse. Avec l'estat des parties du corps*). He was also very interested in logic (see for example : *Idea Frambesarianae Academiae, in qua celebrentur scholiae artium ad humanitatem excolendam pertinentium, dialecticae, rhetoricae, grammaticae, scholae philosophicae, cum ethicæ*) and dialectic, and more generally in questions about the order and method to be employed in the arts and sciences (see the titles of his books: *Les Canons requis pour practiquer methodiquement la chirurgie*, *Canonum medicinalium libri tres. Quibus aphoristica methodus medendi*

affectibus corporis partium, primo animalium, secundo vitalium, tertio naturalium continetur, Les loix de medecine pour proceder methodiquement à la guarison des maladies, Ordonnances sur la composition des medicamens, que les apothicaires doivent dispenser en leurs boutique, etc.), in medical education (*L’etat des parties du corps humain, methodiquement dressé en faveur des estudians en medecine et chirurgie*), and in education in general (*La Principauté de l’homme, où la Grammaire, la logique et la physique sont methodiquement descriptes en françois, pour apprendre aisement et en peu de temps les langues principales, l’usage de raison et l’histoire du monde*). Stephen Bamforth’s research clearly demonstrates the influence of Ramus on his work (Bamforth 2008).

Laqānī, ‘Abd al-Salām

Born: Late 16th/early 17th century

Died: 1668

Jari Kaukua

Department of Social Sciences and Philosophy,
University of Jyväskylä/Academy of Finland,
Jyväskylä, Finland

Abstract

The son of a famous jurisprudent, ‘Abd al-Salām al-Laqānī was a seventeenth-century theologian and Mālikite jurisprudent who taught at al-Azhar in Cairo.

Alternate Names

Nāṣir al-Dīn ‘Abd al-Salām ibn Ibrāhīm al-Laḳānī al-Mālikī

Biography

The son of an al-Azhar professor, the conservative Ash‘arite theologian, and the Mālikite jurisprudential authority Ibrāhīm Burhān al-Dīn al-Laḳānī (d. 1631), ‘Abd al-Salām al-Laḳānī followed his father’s career, eventually succeeding him in the teaching position at the prominent institution in Cairo. He died in 1668.

Al-Laḳānī wrote two commentaries on his father’s popular verse form creed *Jawhara al-tawhīd* as well as on his autocommentary *Hidāya al-murīd*, respectively titled *Ithāf al-murīd*, *Irshād al-murīd*, and *Hadīya al-murīd*. The two first works were subject to further commentaries at least down to the late nineteenth century. They, like the elder Laḳānī’s original, represent a phase of conservative Ash‘arism that departs from the tradition of philosophically ambitious *summae* and commentaries that reaches from Fakhr al-Dīn al-Rāzī to ‘Aḍud al-Dīn al-Ījī, Sa‘d al-Dīn al-Taftāzānī, and al-Sharīf al-Jurjānī. In al-Laḳānī’s works, the extended discussion of systematic metaphysical and epistemological questions gives way to an emphasis on an orthodox treatment of traditional theological topics, such as God’s unity and its relation to His attributes, prophecy, human agency, and responsibility (the question of *iktisāb*), key moments of early Sunnī history, and various revealed doctrines, with general questions on the nature of existence or on the debate over atoms emerging only sporadically for somewhat superficial treatment.

Las Casas, Bartolomé de

Born: 1484, Sevilla

Died: 18 July 1566, Madrid

Luca Baccelli

Università degli Studi di Camerino, Camerino, Italy

Abstract

Well known for his militant struggle in defense of the Native Americans, in his writings Las Casas offered relevant insights into relevant theoretical fields – such as rights theory, “just war” theory and its critique, the question of the exploitation of labor – and showed a pioneering capability to acknowledge cultural differences. Las Casas’s thought was framed by the Aristotelian-Thomistic paradigm and Canon Law, but re-elaborating that heritage he was able to open seminal paths to modern political theory.

Biography

Born in Seville – the European terminal of the conquest – Las Casas was from childhood

connected to Spain's involvement in America. When he was 18 years old he arrived at Hispaniola, where he managed the family farm and joined the expedition to repress the Indian uprising in Higüey. After returning to Europe, where he was ordained priest and possibly graduated in Canon law, he went back to Hispaniola where he started his own business. Appointed as Chaplain of the militarily enforced "pacification" of Cuba, Las Casas witnessed the awful violence by the *conquistadores* and the extreme exploitation of the natives. He gained appreciation from the indigenous people by attempting to save lives and peacefully convert souls. Despite this, the Spanish colonial government rewarded him by allowing indigenous people in *repartimiento* to work as servants in his *encomienda*, which was the typical form of forced labor recently institutionalized. But in 1514, at the time of his "first conversion," he redirected his energy to the cause of the Indians, deciding to denounce the illegitimacy and the sinfulness of the detention of natives and to restitute his servants to the governor. As his claims were ineffective, he crossed the Atlantic to Castile in order to denounce the conquest and to advocate for the Indians in court. There he was strongly opposed by the bishop Juan Rodríguez de Fonseca who was delegated to manage the Indian affairs but gradually the cleric gained support from Cardinal Cisneros. Then, after the death of King Ferdinand in 1516, the cleric's proposals were favorably received by Adrian of Utrecht, the future Pope Adrian VI, who started to reform the colonial system, designating three Hieronymite friars to implement the proposals. Las Casas was deeply involved and was appointed with the official status of "Protector of the Indians," but the project got no further. Back in Spain, he gradually succeeded in gaining the trust of the Flemish entourage in the court of Charles V. He was authorized to attempt an experiment of peaceful colonization over 260 leagues of the continental coast. Confronting the establishment opposition in Hispaniola, in 1521 he agreed to include prominent colonists in the enterprise. Such a "bargain with the devil" ended in a catastrophe: when Las Casas was absent, the natives attacked his fellows, killing four of them.

This was probably the gloomiest moment in Las Casas's life. He began to distrust the very idea of his mission and decided to join the Dominican order (his "second conversion"). During more than a decade of retirement and meditation, he deepened his theological studies and started to write theoretical and historical works. In 1534 he came out to battle, convincing the cacique Enriquillo to end his rebellion. Then Las Casas transferred to central America, where, either fighting against the governors or earning their support, he contributed to the peaceful evangelization of Tuzutlán and to the drafting of statements in favor of the Indians by the local ecclesiastical hierarchy. Back in Spain in 1540, his treatises and pamphlets (including the *Brevísima Relación de la Destrucción de las Indias*, destined for international reception in the following decades) gave impetus to the proclamation in 1542 by Charles V of the *Leyes Nuevas*: a quite radical reform that remained ineffective and was revoked for the most part. From 1543 to 1547, Las Casas was back in America, as bishop of Chiapas. There the colonists' opposition to his intransigent attempts to enforce the *Lejes Nuevas* escalated to physical threats. Back in Spain, in 1551–1552 he contested the legitimacy of the conquest in the Valladolid *congregación* convened by the king, confronting the humanist Juan Ginés de Sepúlveda (1490–1573). The last two decades of the friar's life were spent writing his works, which expressed progressively more radical thought, recruiting missionaries, fighting battles against the charge of heresy on the bishop Bartolomé Carranza, and against the attempt by the Peruvian colonists to transform the *encomiendas* in hereditary feuds (Clayton 2012, Ortega 2007, Rand Parish and Weidman 1992).

Heritage and Rupture with the Tradition

Las Casas's thought was framed by the Aristotelian-Thomistic paradigm and honored the *auctoritates* of medieval thinking. He was inclined to trust the assumptions of ancient natural philosophy and even traditional superstitions,

e.g., on celestial influences and witchcraft, but nevertheless showed some openness to empiricism. His legal competence was sound; he adopted the concepts and style of the canonists (Cárdenas Bunsen 2011) and suggested some theoretical innovations in legal theory, especially in the field of rights theory (Beuchot 1994, Tierney 1997). Belonging fully to the “revival of Thomism” (Skinner 1978), his consonance with Aquinas’ approach to the relationship between faith and rational knowledge is evident (e.g., OC2, pp. 24–70). Though some elements of novelty in his theological thought have been emphasized (Gutiérrez 1992), the chief originality in Las Casas’s thought is to be found mainly in political theory.

Innovative and Original Aspects

The Illegitimacy of the Conquest. Las Casas’ position on the legitimacy of the conquest changed over the years. His 1516 *Memorial de remedios* proposed a sort of refurbishment of the *encomienda* system. In his proposal, the displacement of natives, their work together with virtuous Spanish farmers, and even the limits to the length and the harshness of their labor, were integral to a disciplinary model whose end was the “civilization” of the Indians and the rational exploitation of their work and natural resources. After his second conversion, Las Casas stated that *the only way* to convert the infidels was by peaceful means (OC 2). Nonetheless, in the early writing of his *Historia de las Indias*, Columbus is depicted as a providential hero who opened the gates of the Ocean to Christianity and consequently the possibility of salvation for millions of souls (OC 3, pp. 353–365, 494–495). In the following years, his criticism of the two causes of the destruction of the Indies – the cruel and unjust wars of conquest and extreme exploitation – became more and more radical. During his episcopacy in Chiapas, Las Casas stressed the superiority of ecclesiastical power over the secular one in order to bring back the Indians qua “poor people” under the protection of the bishops. In any case, when accused of

jeopardizing the Spanish Empire in the Indies, he theorized that its legitimacy depended on the vicar of Christ’s mandate to Christianize (OC 10, pp. 197–214, 391–543): he maximized the role and the power of the crown in order to downsize the pretensions of the settlers and to grant the political autonomy of natives’ communities. But in the following years, one can see a further radicalization: the pope’s investiture conferred to the kings of Castile a mere *ius ad rem*, i.e., a jurisdiction *in habitu*. In *De Thesauris* (OC 11.1) only the explicit consensus by the people and their natural rulers, stated in a formal treatise, could transform it into an *ius in re*, an actual (*in actu*) jurisdiction. Only at this point could the Spanish king assume a “sort” of imperial role which would not revoke the free enjoyment of rights and powers by native kings and peoples. Moreover, in the *Doce Dudas* (OC 11.2), Las Casas argued in favor of the restitution of his kingdom to the descendants of the Inca. The diagnosis of the illegitimacy of the conquest is ruthless: “Todos los reynos de las Indias tenemos usurpados” (OC 11.2, p. 217).

Just War. Las Casas adopted the “just war” theory in the version elaborated by Francisco de Vitoria (1483? – 1546): the only just cause for war is an *iniuria*, i.e., the violation of a *ius*, a basic right. But according to Las Casas, the just cause belonged only and always to the Indians: “they had, from the very beginning, every right to wage war on the Christians, while the Christians never had just cause” (OC 10, p. 40). In his historical works, Las Casas offers a horrifying phenomenology of the terrorist violence perpetrated during the conquest of the different areas of the Americas. He contested the supposed just causes on the side of the Spaniards (such as the natural slavery of the “barbarians,” evangelization, anthropophagy, or human sacrifices) and turned Vitoria’s theory upside down. Vitoria proclaimed a series of universal natural rights relating to communication, commerce, the appropriation of common goods, and the freedom to announce the Gospel, suggesting that their violation by the “barbarians” constituted an *iniuria* and consequently a just cause. Contrarily, Las Casas emphasizes the right of the legitimate political communities to

defend their borders, protect their jurisdictions, and even resist the preaching of Christianity (OC 9, p. 350).

In some texts, the very theory of just war appears to be nearly abandoned. War is defined “multorum homicidium commune et latrocinium” (OC 2, p. 380), and it is shown to be difficult to save the innocent. Moreover, the similarity between war and legal trial is contested. In his last works, however, Las Casas came back to the theory and radicalized it to extreme effect. To be entitled by the just cause gives to the Indians the right to resistance, vengeance, and punishment of the Spaniards, who can be reduced to slavery according to the *ius gentium*. If the just war theory was born in Late Antiquity in order to legitimize the recourse to war by Christians, its imperialistic function was jeopardized by Las Casas’ arguments.

Slavery and Forced Labor. In the sixteenth century, the *ius gentium* justification of slavery – based on an exchange between life and freedom on the part of a defeated enemy in a just war – was generally accepted, but Las Casas, negating the legitimacy of *all* conquests, declared invalid *every* reduction to slavery of prisoners. In some cases, the slaves were purchased from other natives: Las Casas contested the legality of such purchases. The Aristotelian theory of natural slavery – based on the idea of lesser rationality, and consequently *humanitas*, of the “barbarians” – is deconstructed by distinguishing between different meanings of “barbarian” and arguing that “barbarian” in a proper sense refers only to wild and idiotic individuals who live in isolation, and this category cannot be applied to the Indians (OC 9, pp. 76–124). Some years later, in *De regia potestate*, Las Casas de facto revoked entirely the Aristotelian theory, stating that the natural freedom of human beings is a function of their rationality (OC 12, pp. 34–36).

During his “reformist” period, Las Casas proposed on several occasions the use of African slaves in order to replace the Indians, and his detractors accused him of being the first theoretician of the slave trade. Actually, in the fifties, he wrote a bitter self-criticism on this

point (OC 5, p. 2324) in which he considered the slavery of the Africans to be as bad as the forced labor of the Indians (Pérez Fernández 1995).

Las Casas showed the consequences of the exploitation system, which consumed its servants to death and induced a state of profound depression: “they forget to be humans” (OC 4, p. 1287). The *encomienda* was a devilish, “intrinsically evil” institution, which destroyed the policies of the Indians (OC 13, p. 290) and inhibited the exercise of rational faculties and even the Christian faith (p. 288). The overturning of the Aristotelian theory is clear: it is not insufficient rationality that makes the barbarians natural slaves; it is rather a slavery that blocks the development of rationality.

Anthropology. Las Casas is considered a forerunner of cultural anthropology (Hanke 1951; Pagden 1982). In the *Apologetica historia sumaria*, the ways of life, religions, political institutions, and legal systems of American peoples are compared to ancient ones in order to show that the former match the Aristotelian test of human rationality and political virtue and also obtain equal or even better scores than ancient Jewish, Greek, and Roman systems. Las Casas’s goal is evidently to refute the charges of barbarity, lesser rationality, or even ferocity that were adduced in the first reports on the Indians, and their alleged incapacity to govern themselves. In doing so, he assumes one specific model of humanity and rationality. On this basis, Las Casas has been accused of being co-responsible for the “spiritual conquest” of America, the imposition of the “Christian” way of life by the “ecclesiastical imperialism” if not of “cultural genocide” (Subirats 1994; Castro 2007).

Nonetheless, Las Casas evaluated the beliefs, rituals, and sacrifices in the Indies as being more rational and virtuous than several of the ancient ones and emphasized the natives’ devotion, acknowledging the dignity of the indigenous faiths. The *experimentum crucis* of Las Casas’ strategy is the issue of human sacrifice. Las Casas attributed to this practice a literally devilish origin (OC 7, p. 686), but he stated that the Christian princes,

and even the pope, lacked the jurisdiction to prohibit them. Moreover, on the one hand, he argued, human sacrifices are an immemorial custom and are recommended by their leaders and the men whom they consider the wisest: it is impossible to extirpate them by war. On the other hand, to sacrifice to God is mandatory by natural law, but it is the positive law that establishes what and how to sacrifice. In the absence of divine revelation, it is rational to sacrifice what has the higher value, i.e., human life.

Political Theory (Queraltó Moreno 1976). In Las Casas' political theory, every human being is entitled to *dominium* and consequently, infidels have property rights just as Christians do. Beyond the private law field, also the power and the jurisdictions of the infidels are justified by natural law (OC 10, pp. 550–54). There are indeed different levels of jurisdiction: the imperial one of the kings of Castile is compatible with the actual power of the native leaders and the autonomous government of the communities (OC 11.1, p. 112). The Aristotelian political theory, by which the submission of the Indians was largely justified, is reversed by Las Casas to affirm the legitimacy of their “natural rulers.” In any case, Roman law and Thomist philosophy offer arguments for defining the natural liberty of individuals and people as inherent, universal, and original natural rights (OC 13, p. 127). Consequently, the consensus of individuals and peoples is necessary to institute political power (OC 12, pp. 34–60); if this idea had been and will be used in order to legitimize absolute sovereignty, according to Las Casas there is no consensus that this should remain the case once and for all. The sovereign must govern for the common good and under the rule of law: “in this way the citizens remain free and do not obey to a man but to the law” (OC 12, p. 84). Every transfer, assignment, and gift of jurisdiction has no legal force in absence of the consensus by the ruled (OC 12, pp. 146–148). Here the reference to the projected institution of the perpetual *encomienda* is clear. Moreover, Las Casas qualifies the actual Spanish rule in America as tyranny, and reminds the reader that against the

tyrant, “plague of the republic” (OC 9, p. 412), rebellion and even killing are a right and even a duty (OC 8, p. 1452, OC 10, p. 560 11.2, pp. 130–132). In general, “wherever justice is missing, the oppressed and the humiliated can take it into their own hands” (OC 5, p. 2307).

Impact and Legacy

Las Casas has been evaluated in radically different ways, from being demonized to being uncritically defended. His contemporary adversaries accused him of betraying the civilizing mission entrusted to the Spanish nation, a charge that was again used during Francisco Franco's dictatorship. Las Casas' influence on policymakers was significant, and in the following epoch, his thought was used within the Protestant milieu in order to supply arguments for the so-called *Leyenda negra*, to whom the “White Legend” would later respond in constructing a Hispanophile counter-narrative. Las Casas has been both analyzed as a dual-personality psychopathic (Menéndez Pidal 1963) and exalted as the Apostle and Prophet of the Americas (André-Vincent 1980). Recently, he has been considered, on the one side, as the founder of humanitarian anticolonialism, and, on the other side, as a supporter of imperialism (Young 2001, Todorov 1982, Castro 2007, Mora Rodríguez 2012). Beyond direct political influence, his interpreters have emphasized the theoretical relevance of Las Casas' work: its seminal insights on issues such as human rights discourse, the foundation of International Law, and popular sovereignty (Baccelli 2016).

Lascari, Costantino

Born: 1433–34, Costantinopoli

Died: 1501, Messina

Sarah Bonciarelli

Ghent University, Ghent, Belgium

Abstract

The scholar Constantine Lascaris was born in Constantinople and arrived in Italy following the fall of the Byzantine Empire in 1453. After a period spent in Milan, where he held the position of Greek teacher to Ippolita Sforza, he traveled to Ferrara, Florence, and Naples before settling in Messina, where he opened a school to teach Greek. The school achieved national fame, and great intellectuals including Giorgio Valla and Pietro Bembo traveled to Sicily to study Greek. Traces of his Sicilian experience can also be found in *Vitae illustrium philosophorum Siculorum et Calabrorum* (1499), one of the few printed works by Lascaris, which includes biographies of Sicilian and Calabrian philosophers.

He is also remembered for his activity as a prolific copyist and for the discovery of the *Gigantomachia*, a Greek work by the Latin poet Claudiano.

Biography

Constantine Lascaris was born in Constantinople and arrived in Italy after escaping imprisonment by the Turks following the fall of Constantinople (1453). Before arriving in Italy, he traveled to Greece via Phrae, Rhodes, and Crete. He settled in Milan, where he became the Greek teacher for Ippolita, the daughter of Francesco I Sforza (Motta 1893). He went on to live in various cities, teaching Greek, probably in Ferrara and certainly in Florence and Naples, where Ferdinando I of Aragon appointed him a professor of rhetoric. Lascaris was perhaps also in Naples to follow Ippolita Sforza, who had married the Duke of Calabria (Wilson 1992).

In 1466 he suddenly left Naples, where he had made a substantial contribution to the development of Greek studies in the city. With the intention of returning to Greece and leaving Italy, Lascaris went to Messina, but following Ludovico Saccano's insistence, he decided to stay, as it was one of the last cities where Greek was still being taught (Lipari 2013). After some initial difficulties, the intellectual integrated into local life and remained in Messina until his death (Concetta 1988, Perroni 1902; Russo 2003–2004; Harris 1995).

Shortly before Lascaris' death, in 1499, one of his few printed works was published: *Vitae illustrium philosophorum Siculorum et Calabrorum*, which included biographies of Sicilian and Calabrian philosophers. The work, which Lascaris labored on for a long time, aimed to recover a great cultural tradition that was fading into neglect and abandonment.

The marginalization that Lascaris suffered, with regard to the great humanistic cultural circles, allowed him to devote himself to philological activity and above all to make use, for his research, of the impressive amount of Greek codices represented by the public and private book collections of southern Italy and by the manuscripts. Lascaris' Greek school achieved national fame, and, among others, Giorgio Valla and Pietro Bembo went to Sicily to take his lessons (Evola 1959–1960; Nicosia 2014). As a sign of gratitude to Sicily, which had welcomed him, Lascaris donated his library to the Senate and the people of Messina around 1494. His codices remained in Messina for 200 years and were later transferred to Palermo and then again to Madrid, where they are kept at the Biblioteca Nacional de España. In August 1501 Lascaris contracted the plague, dying shortly afterward, and was buried in the Carmelite church of Messina (Ceresa 2004; De Rosalia 1957–1958; Martínez 1994).

Innovative and Original Aspects

His greatest work is the Greek grammar, called *Erotémata*, begun during his stay in Milan and

was published for the first time in 1476. This was the first book printed in Greek characters after the invention of typography and represents a basic grammar for learning the Greek language, consisting of pure rules. It is divided into three books and, following numerous stages of creation, had several editions between the end of the fifteenth and the beginning of the sixteenth centuries. This was a very widely used grammar until the nineteenth century.

Lascaris' work has served as a model for all Greek grammars. An unusual testimony to his fame is the fact that it is mentioned by Thomas More in *Utopia*, where it is listed together with the great classics that Raffaele Itlodeo brings to the inhabitants of Utopia so they can learn Greek.

Impact and Legacy

The humanist owes his fame in particular to the discovery of the *Gigantomachia*, the Greek work by the Latin poet Claudiano.

Lascaris found and copied 77 verses, including a gap of 68 verses that he intended to fill himself thanks to finding a fragment of the work in some manuscripts given to him. The discovery of this fragment is recorded in a letter Pietro Bembo wrote to Poliziano in 1493, in which he says that Lascaris had received as a gift some manuscripts in very bad condition, and among these, he had discovered the fragment of the work. This document attests to the humanist world's great interest in the work. Lascaris' main undertaking was defending the classical texts that he saw increasingly at risk of being forgotten after the decline of the Byzantine Empire. Lascaris worked on putting together collections of authors with similar characteristics and formed bodies of rhetoricians, epistolographers, poets, and individual authors. His Greek and Latin works are collected in *Migne, Patrol. Lat.*, CLXI, coll. 913–970.

Shortly before his death, Lascaris saw the publication of one of his few printed works, the aforementioned *Vitae illustrium philosophorum Siculorum et Calabrorum*, which was published in Messina. The work included biographies of 66 Sicilian and 35 Calabrian philosophers.

Besides being an esteemed Greek teacher, Laskaris is known as a copyist. There was a lack of expert copyists, and at the time he was working, most copyists did not know Greek and were limited to copying the characters. Thanks to the efforts of Laskaris and other humanists, the ancient Greek language began to acquire an important role in classical education.

Laskaris, Ianos

Born: ca. 1445, Constantinople

Died: 1534, Rome

Christina Kakkoura

University of London, Royal Holloway and
Bedford New College, Surrey, UK

Abstract

Ianos Laskaris (ca. 1445–1534) was a prominent figure in the intellectual life of Italy and France in the fifteenth and sixteenth centuries. He was a humanist, a scholar, and a diplomat, who has contributed to the Italian Renaissance and French Humanism and the transmission of Greek learning to Western Europe. Laskaris is also known as a manuscript collector and a librarian, an editor, a publisher, a translator, and a teacher. He was a Byzantine émigré and a representative of the Byzantine tradition, worked for the revival of classical studies in the West, and was devoted to the cause of the liberation of Greek lands from the Ottoman Turks. Ianos has been rightfully characterized as “an ambassador of Hellenism.”

Biography

Ianos Laskaris' name is also spelled as Janus Lascaris, his real name being Ioannis (Giovio [1577](#); Vast [1878](#); Pontani [1992b](#)). He is known also as Rhyndakinos or Rhyndacenus, an agnomen himself uses most possibly to indicate his family's place of origin, Rhyndacos in Asia Minor. Ianos was considered to be a descendant of the Byzantine imperial family of Laskaris and his contemporaries often addressed him as “Byzantius” or “Constantinopolitanus,”

emphasizing thus his Byzantine origin (Legrand 1885a; Knös 1945). Information about Laskaris' early years is scarce. He was born around 1445, and after the Fall of Constantinople (1453), he and his father found refuge in the Peloponnese, at the time still under the Palaeologans. From there he left for the Venetian-occupied Crete and later for Venice. In Italy, the young Ianos was most possibly under the patronage of the scholar and philosopher Cardinal Basil Bessarion (ca. 1400/08–72) and later went to the University of Padua to study Greek and Latin. He was taught by Demetrios Chalkokondyles (1423–1511), who held the chair of Greek studies (1463–1472). Sometime between the years 1472 and 1475, after Bessarion's death (1472) and at the time of the assumption of the chair of the Florentine *Studium* by Chalkokondyles (1475), Laskaris moved to Florence. There he became acquainted with members of the House of Medici and other prominent figures of the Italian Renaissance and worked together with Demetrios Chalkokondyles. Ianos entered the service of Lorenzo de' Medici (1478–1492), a supporter of Greek studies, who aspired to enrich the library with the purchase, collection, and copying of Greek manuscripts and assigned Laskaris with those tasks.

It has been suggested that it was due to his Byzantine and noble origin and his outstanding scholarly and literary abilities that Lorenzo entrusted him with such a role (Speake 1993). Ianos was successful, and his efforts, especially in the Ottoman occupied areas, were facilitated by the fact that he acted as an official envoy of Lorenzo and had recommendation letters addressed to sultan Bayezid II (1481–1512). Laskaris was sent on two missions, in 1490 and 1491, during which he visited libraries of monasteries and private collections, in Italy (Ferrara, Verona, Venice, Padua, Apulia, Corigliano, Monte Sardo), Constantinople, Sozopolis, and former Byzantine provinces in Greece (Corfu, Arta, Thessalonike, Mount Athos, Crete), and procured Greek manuscripts. The notebook in which Laskaris listed the manuscripts he was planning to acquire and those he managed to locate, which survives in codex *Vaticanus graecus* 1412, is proof that his efforts were successful

(Trapp 1980; Speake 1993). Laskaris brought with him more than 200 Greek manuscripts, which were deposited in the Laurentian Library in Florence (Legrand 1885b; Gentile 1994). His journeys also served a political aim, i.e., to gather information concerning the political and military situation in the Ottoman-occupied areas.

While Ianos was in Crete, Lorenzo died (1492). Laskaris remained in the favor of Lorenzo's son and successor, Piero de' Medici (1492–1494). He returned to Florence and retained his position as a librarian at the Laurentian library. He was also appointed at the Florentine *Studium* (1492–1496) and taught Greek philosophy and poetry, Sophocles and Thucydides, Demosthenes, and Greek epigrams (Müllner 1899; Meschini 1983; Lauxtermann 2009). At that time, a dispute about matters concerning mostly the Greek language and teaching practices arose between Laskaris and Angelo Poliziano (1454–1494) (Legrand 1885a; Wilson 1992; Lauxtermann 2009). In a speech composed in Latin, which he delivered while he was in the Florentine *Studium*, Laskaris declared the superiority of the Greek language and literature over Latin (Meschini 1983; Lamers 2015).

While in Florence, Ianos produced a number of editions. Laskaris remained in Florence until the invasion of Italy by the French King Charles VIII (1483–1498). Although Charles' plans failed, the subsequent exile of the Medici from the city in 1494, and the assumption of authority by Girolamo Savonarola (1452–1498), a Dominican reformer, forced Laskaris to look for a new patron (Legrand 1885a). Thus, at the invitation of Charles VIII, whom he met in Florence, and with whom he shared the hope of the liberation of the Ottoman-occupied areas in the East, Ianos came to France (1496). He entered the king's court, acting, namely, as his adviser in scholarly matters.

In France, Laskaris was well received and pursued his literary activities, taught Greek, and translated and edited Greek texts, thus contributing to the revival of Greek letters in France. He became attached to French humanists, as Jacques Lefèvre d'Étaples (1460–1536) and Robert Gaguin (1433–1501), and befriended the

humanist Guillaume Budé (1468–1540). Of significance was also the connection Laskaris established with the scholar cardinal Georges d'Amboise (1460–1510), the king's advisor in foreign affairs. Together with d'Amboise Laskaris participated in diplomatic missions sent by Charles VIII's successor, King Louis XII (1498–1515). In 1500 he joined the king's embassy to Milan. In 1503 Laskaris acted as the king's delegate in Venice and in 1504 was appointed as ambassador of France to the Italian city, where he remained until 1509. In Venice, a center of humanism and printing, Laskaris found his former student and friend Marcus Musurus (1470–1517) (Geanakoplos 1962) and came in close connection with Aldus Manutius (1449–1515), becoming also a member of the latter's "New Academy."

Laskaris went to Rome in 1513, the year when Giovanni de' Medici ascended to the papal throne as Pope Leo X (1513–21). The two learned men shared a passion for classical studies and harbored the hope of the revival of Greek letters in Rome. They also wished to create an educational center where, in addition to Italian students, Greek émigrés from the Ottoman-occupied Greece would be given the opportunity to study Greek and Latin. Laskaris founded the Greek School of Rome, which began its function in 1514 and attracted students from Greece (Legrand 1885b). The teaching of Greek was assigned to Laskaris, Zacharias Kallierges (1473–1524), and Marcus Musurus, and of Latin to Giovanni Benedetto Lampridio (1478–1539).

In 1518 Laskaris went to France where he contributed to the establishment of a College under the auspices of the French King Francis I (1515–47). During the years 1520–1525, he worked on the creation of a Greek School in Milan. Yet his efforts bore no fruit due to financial and political obstacles. On his return to Rome in 1525, the newly elected Pope Clemens VII (1523–34) assigned to Laskaris a diplomatic mission. After the defeat of the French in the battle of Pavia (1525), King Francis I was held in captivity by King Charles V (1519–1556), and Ianos was given the task to engineer a reconciliation between the two kings. In order to achieve this,

Laskaris met with Charles V in Madrid. Although the mission failed, Ianos delivered an impressive speech prompting Charles to undertake a crusade against the Ottomans (Legrand 1885a; Whittaker 1977; Nikas 1995).

Laskaris returned to Paris, to leave a few years later (1530) for Rome, where he spent the final years of his life, pursuing, despite his old age and ill health, his literary tasks and continuing his didactic and copying activities. Ianos Laskaris died on December 7, 1534 (Mercati 1910) at the age of 90 and was buried in the church of Saint Agatha in Rome.

Heritage and Rupture with the Tradition

Laskaris is considered one of the most influential figures active in Italy and France in the fifteenth and sixteenth centuries. Ianos was not involved in philosophical controversies and the adoption of new approaches to Platonic and Aristotelian theories that occurred especially during the period he was active in the Florentine *Studium*, but rather confined himself to the promotion of the study of Greek texts (Knös 1945). Nevertheless, following the intellectual tradition of Byzantine émigrés, and more specifically of those who were adept in Latin, he sought to synthesize elements from the Byzantine tradition and education, as it evolved during the Palaeologan Renaissance, and from the Italian Renaissance (Geanakoplos 1989). Laskaris purchased and copied a significant number of Greek manuscripts. Thanks to his efforts, many Greek codices found their way into libraries, and several texts became accessible to scholars in the West. Laskaris also possessed a large private library that included ca. 200 manuscripts (Papatriantaphyllou 1988; Mondrain 2000).

Applying the editorial practices of his fellow Byzantines (Legrand 1885a; Staikos and Sklavenitis 2001), Ianos devoted himself to the dissemination of printed books. His editorial and typographical initiatives show that Laskaris was aware of the importance of the edition of texts, especially with scholia, and of printing as a means of promoting and spreading Greek letters, realizing at the same time the increasing interest of the

Italian humanists in Greek texts (Geanakoplos 1989). As Laskaris himself declares in the *Prologue* of the edition of Plutarch's *De liberis educandis* (*Paidagogos*), his aim is to provide "people with essential school handbooks, so that the ecumenical character of the ancient spirit will not be lost" (Staikos and Sklavenitis 2001). It could be therefore suggested that Ianos had an editorial and a publishing philosophy, which becomes evident even in his use of capital letterforms in his editions, which were designed in a classicized manner (Pontani 1992a; Staikos and Sklavenitis 2001). During his stay in Florence (1494–1495), Laskaris published several books: the *Anthology of Various Epigrams*, that is the *Planudean Anthology* (1494), four tragedies by Euripides (*Medea*, *Hippolytus*, *Alcestis*, *Andromache*), the *Hymns* of Callimachus with scholia and Apollonius Rhodius' *Argonautica* (1496) accompanied with scholia, Lucian's *Dialogues* (1496), the *Adages* (*Gnōmai*) from *Various Poets*, the edition of the *Erotemata* (*Questions*) of Manuel Chrysoloras, as well as the edition of the *Table* of Cebes (1495) together with Basil of Caesarea *Address to Young Men on the Right Use of Greek Literature* and Plutarch's *De liberis educandis* (*Paidagogos*), which were printed to be used primarily for educational purposes. Although not all of the aforementioned works were included in the Byzantine curriculum (Wilson 1992), the *editio princeps* of the *Greek Anthology* (1494), a work widely used in Byzantine education, further supports Laskaris' characterization as a representative of the philosophy of Byzantine émigrés, who aspired to transmit the Byzantine literary tradition to the West (Harris 1995; Lauxtermann 2009). In the *Prologue* to the *Anthology*, Laskaris addresses a plea to the Muses to conserve the glory and heritage of Greece which will spread to the West through books (Laskaris 1494; Legrand 1885a). Laskaris was engaged in printing and editorial activities in the press house of the Greek School of Rome and produced five editions, a *Commentary on Homer's Iliad* (1517), *Porphyry's Homeric Questions on the Iliad* (1518), *Commentaries on Seven Tragedies by Sophocles* with scholia (1518), the *Philosophical and Rhetorical Miscellany* (1519), *Apophthegms of Philosophers*

and *Generals* (1519), and most possibly Isocrates' *Speeches* (1520). Following the tendency of his times, Ianos produced a number of *Epigrams* (Laskaris 1976) which he addressed to his contemporaries. Of importance are also his translations of Greek texts into Latin. Translations of Proclus' *Hymns*, the *Orphic Hymns*, and the *Chaldaean Oracles* are attributed to Laskaris (Vast 1878; Manousakas and Staikos 1986, Pontani 1992b).

Impact and Legacy

The importance and value of Ianos' editorial legacy become evident in Marcus Musurus' dedicatory letter to Laskaris in the *Prologue* of his edition of *Pausanias* (Musurus 1516). There, Ianos is praised for his contribution to the propagation of Greek culture through editions, an example of this being the *Greek Anthology*, since Laskaris' "form of the text was adopted by all subsequent editors until the second half of the eighteenth century" (Wilson 1992). In the same epistle, emphasis is placed on Laskaris' impact on printing activities in Italy, particularly his influence on the Venetian printer and publisher Aldus Manutius, as well as on the Florentine publishing house of the Giunti (Legrand 1885a). His contribution to French intellectual life was also of importance, since Laskaris was a pioneer in the systematic teaching of Greek in the country (Geanakoplos 1962).

In general, Laskaris had a profound influence on Italian Renaissance and French Humanism and is considered to have been one of the most influential Byzantine scholars acting in the West. Laskaris has been "a patron of all the Greeks everywhere, supporting as nobody else before the liberation of the Greeks" from the Ottoman Turks, who solicited the support of European rulers and promoted the idea of a crusade against the Ottomans. The crusade signified for Laskaris also a struggle for the preservation and expansion of the Greek heritage, culture, and language. Musurus mentions that Laskaris was greatly concerned with "the indescribable desolation the piteous Greeks were suffering" and the fact

that they lacked autonomy and had been deprived of their country, which he hoped they would regain with support from the West, through Greek-oriented education and the rediscovery of their true identity (Legrand 1885a). Musurus' statement attests to the fact that Laskaris was "universally venerated and admired" (Geanakoplos 1962) and instrumental in the propagation of the idea about the continuity of Greek culture and identity.

Ianos promoted his ideas through his teachings, works, and political missions. He appears to have always remained a generous patron of the Greek émigrés in the West, a representative of the Byzantine tradition with a profound commitment to the Renaissance ideals and values.

Latin in the Renaissance

Laura Carotti

Scuola Normale Superiore, Pisa, Italy

INSR, Florence, Italy

Abstract

During the fifteenth century, the supremacy of humanism led to the adoption of Latin as the language of culture. While the use of written vernacular expanded in the commercial, religious, and administrative areas, high-literary culture was expressed in Latin. In this period two particular linguistic experiments were born, spanning both Latin and the vernacular: macaronic Latin and pedantic jargon. However, the 1520s and 1530s saw the progressive establishment of the vernacular, and a century later, with Galileo Galilei's *Dialogo sopra i due massimi sistemi del mondo*, it also became the language of science.

Innovative and Original Aspects

In the fifteenth century, the rediscovery of the classics and the affirmation of humanism led to

the rise of Latin as the language of culture, to the detriment of the vernacular. While the use of vernacular writing expanded in religious, commercial, and administrative circles, literary culture was expressed in Latin. Only in Florence, thanks to its fourteenth-century vernacular tradition boasting Dante, Petrarch, and Boccaccio as its most important exponents, there was also a notable humanist trend in the vernacular, whose protagonists were Leon Battista Alberti in the 1430s and Angelo Poliziano and Cristoforo Landino in the 1470s and 1480s. In this period, several peculiar linguistic experiments arose spanning Latin and the vernacular: macaronic Latin and pedantic jargon (Petrucci 1993; Richardson 1999; Waquet 1998).

Macaronic poetry originated in Padua in the late fifteenth century and is characterized by a mixture of vernacular and dialect vocabulary and Latin morphosyntactic forms: low words, even in dialect, are inserted prosodically in Latin hexameters (Paccagnella 1979). The greatest connoisseur of macaronic poetry in the 1500s was Teofilo Folengo, who, with his mixture of Latin and spurious elements, proposed a “third way” between Latin and the vernacular, as far from the uncritical acceptance of popularizing elements as it was from the revival of classical Latin. Noteworthy for its particular traits is the Latin used by philosopher Pietro Pomponazzi in his university lectures (Paoli 1959).

The rediscovery of the *reportationes* of Pomponazzi's courses has in fact displayed a language akin to Folengo's macaronic language: Pomponazzi's Latin has frequent vernacular and dialectal inserts and features a convoluted and ponderous syntax. It is a mode of communication similar to that of the macaronic poet, seeking to show that philosophy could also be discussed in the vernacular of Mantua, because first and foremost it is the content, the *res*, and not the *verba*, linguistic preciousness. It is essential to emphasize that for both authors, albeit in different fields, the *contaminatio* between Latin and the vernacular had mainly a pedagogical value: in their view, such a linguistic vehicle was appropriate for representing reality free of the enfeebling constraints of tradition.

Instead, pedantic language is the *latinorum* of the pedants of comedy: it is a facade Latin, in which a hodge-podge of Latin words is transposed into a morphosyntactic vernacular framework. It is an irreverent parody of a linguistic medium, by now completely divorced from reality and its phenomena, reduced to a slavish repetition of terms that have lost their original meaning (Stäuble 1991).

Beginning in the 1520s and 1530s, there occurred a steady decline of Latin and the ascendancy of the vernacular. However, even during the sixteenth century, there were various supporters of the primacy of Latin, such as Romulus Amaseo, who in his 1529 treatise *De latinae linguae usu retinendo* asserted that the vernacular was merely a corrupt variety of Latin, without any real linguistic identity (Amaseo 1580). Ascendant humanistic positions such as that of Amaseo, which, following Aristotelian teachings, were based on the idea that all languages are historical products and therefore conventional, were attacked by advocates of the vernacular who had a “vitalist” approach, such as Benedetto Varchi, according to whom language consists of the spoken, the only truly “natural” situation, and as such it must also inspire written language.

However, it should be emphasized that despite the establishment of the vernacular, the sixteenth-century proponents of Latin such as Amaseo often possessed a historical intelligence that was much more profound than that of their opponents: it is clear, in fact, that the idea of the conventionality of language was more truthful and consistent than the “naturalism” of the vernacularists (Vitale 1960).

Throughout the fifteenth century, the language of scientific theories was Latin; however, since the 1520s the vernacular, previously used only by artists and craftsmen for drafting their technical manuals, also began to be used for scientific treatises, and there were numerous vernacularizations – i.e., transpositions in the vernacular – of scientific texts previously circulating in Latin. An emblematic case is that of Cesare Rao who, in *Meteorì*, published in 1582, set out to expound and comment on the Aristotelian *Meteorologica* in the vernacular (Rao 1582). The process of

establishing the vernacular as the language of science culminated with the 1632 publication of *Dialogo sopra i due massimi sistemi del mondo* by Galileo Galilei, who abandoned any discussion in Latin and demonstrated the full potential of scientific argument in the vernacular (Galilei 1998). A peculiar position within the framework we have outlined was taken by Giordano Bruno. A fierce critic of pedantic *latinorum* – derided in the figure of the pedagogue Manfurio in *Candelaio*, his 1582 comedy – he wrote most of his works in Latin (Bruno 1993). However, his Latin – anti-classical, anti-medieval, and anti-humanistic – was the result of inexhaustible experimentation, aimed at creating a philosophical vocabulary that could truly represent the reality of things, including through the use of neologisms (Carotti 2014). Bruno’s position was isolated and had no followers, but it clearly shows how the brightest Renaissance intellectuals perceived the need for a profound linguistic renewal.

traditionally spoken of a divergence between the traditional jurisprudence of Southern Europe (the *mos italicus*) and the humanist jurisprudence of France, Germany, and the Low Countries (the *mos gallicus*). Although this is a compelling and often helpful schematic, the steady diffusion and predominance of traditional works (like the *opera omnia* of Bartolus) in France and Germany until the end of the sixteenth century speak to a much more complex picture. The appeal of Roman law was largely founded upon its perceived rationality and universality. The traditional practice of Roman law embodied a set of philosophical principles (built upon scholastic dialectic and topical logic) that furnished lawyers with tools for administration and dispute resolution. And humanist-oriented jurisprudence contributed in profound ways to the creation of advanced scholarly, philological, and historiographical techniques.

Law in the Renaissance, Roman

Robert Fredona

Marie Skłodowska Curie Research Fellow, York Management School, York, UK

Abstract

Although the penetration, prominence, and authority of Roman law in practice varied across Europe, the academic study of jurisprudence, which spread with the gradual foundation of universities in the late Middle Ages and Renaissance, nearly everywhere entailed the mastery of Roman legal texts, terms, and ideas. Local legislation and customs were written and interpreted by Roman lawyers using Roman law principles, and Romano-canonical procedures gained purchase in both civil and criminal matters well beyond the traditional, hegemonic centers of Roman law in North-Central Italy and South-Western France. The Renaissance witnessed both the large-scale reception of Roman law across Europe and the application of humanist practices to Roman legal sources. Scholars have

Heritage and Rupture with the Tradition

The jurisprudence of Rome never entirely disappeared in Europe. Influences and fragments of it survived from the sixth to the eleventh century, chiefly but not only in Northern Italy, in legislation, customs, and institutions, as well as in various facets of public life, rhetorical practice, and notarial culture (Witt 2012). The project of freshly unraveling and expounding the doctrines of the massive body of Roman civil law, in the form of Justinian's sixth-century Byzantine codifications (*Corpus iuris civilis*), proceeded by fits and starts, chiefly in the second half of the eleventh century. By the beginning of the twelfth century, the Bolognese teacher known as Irnerius (d. after 1119) was familiar with the whole text of the *Digest*, an enormous compilation of excerpts from the works of Roman jurists like Ulpian and Paulus, that formed (and still forms) the core of the Roman legal learning (Spagnesi 1970). By the middle of the twelfth century, when Frederick Barbarossa (1122–1190) granted special privileges to foreign students in Bologna, the groundwork for the intensive academic study of Roman

law had been laid (Kirshner 2008). In the thirteenth century, universities, with law faculties capable of testing and conferring doctorates upon ambitious young men who had completed a strenuous course of study, became central to legal education and to the creation of a professional identity for jurists, be they civilians (Roman lawyers), canonists, or doctors *utriusque iuris* (of both laws). Even if canonists like Gratian (d. ca. 1145) before the mid-twelfth century still had minimal familiarity with Roman law texts (Winroth 2000), a century later the two laws were symbiotically intertwined and had long been developing side-by-side, together forming the *ius commune* (common law) of Western Christendom (Bellomo 1995).

The rapid expansion of canon law teaching and practice can be easily explained by the truly pervasive influence of the Church, of its courts and procedures, and by the associated possibility of advancement and enrichment along ecclesiastical career paths. The explosion of Roman law depended, instead, and in the first instance, on qualities intrinsic to the texts of classical and post-classical Roman law. The *Corpus iuris* provided persuasive and increasingly authoritative judgments on private law issues of consequence to everyday life, such as inheritance and contracts, and on public law issues of urban, imperial, and royal governance. As a result, the mastery of these texts endowed scholars with expertise and thus with prestige, with honors, and with choice positions in courtly and civic life. More importantly, though, mastery of Roman law provided scholars with a particular mind-set, a way of thinking founded on a specialized conceptual vocabulary and a whole toolkit of textual and philosophical techniques. It is telling in this respect that Roman law was characterized as *ratio scripta* (written reason) and that it could, in the vernacular of Italy, be indicated simply with the word *ragione* (reason) (Fiorelli 2008). And thus can one make sense of the medieval proverb which held that “a Roman lawyer without canon law is worth little, but a canonist without Roman law is worth nothing”; the omnipresence of Church affairs meant that practicing civilians needed a firm grounding in canon law, but being a lawyer in its most basic sense meant

being familiar with Roman law rules, institutions, and ideas. Or, as another proverb put it, “the Church lives by Roman law” (Merzbacher 1967; Brundage 2008).

The earliest work of medieval Roman law jurists took the form of systematic annotations or glosses that sought to reconcile contradictory “laws” (*leges*, the smallest subdivisions of the *corpus iuris*) and to indicate parallel or analogous ones. As a result, and notwithstanding the profusion of other literary and pedagogical forms (like lectures, *summae*, questions, distinctions, and collections of legal rules or brocards), these scholars are often classed as “glossators” (Brugi 1936). The generations of jurists who followed Irnerius grappled with basic problems of legal philosophy, staking out positions all along an interpretational spectrum bounded by equity and the “spirit of the law” (*mens* or *ratio legis*) on one end and the rigorous application of the “letter of the law” (*ius strictum*) on the other (Grossi 2006). Glossatorial works were widely distributed and could, like the *Summa Codicis* of Azo (d. 1220/29), find considerable audiences both inside and outside the classroom (Koschaker 1953). Of particular importance was the so-called *magna glossa* or “great gloss” of Accursius (d. ca. 1260), completed by the mid-thirteenth century, which was based on the work of earlier glossators and which would become the central vehicle of the medieval mediation of the Justinianic texts by fixing meanings and solidifying relationships between terms and would remain so for almost three centuries (Diurni 1991). Although jurists like Dinus (Dino Rossini da Mugello, d. ca. 1303) continued to build upon the work of Accursius, the resounding success of the *magna glossa* and a gradual decline in the vibrancy of the jurisprudential culture that had produced it also suggested the need for new, freer, and more analytical approaches to the texts of Roman law, approaches associated with the School of Orleans and its luminaries Jacobus de Ravanis (Jacques de Révigny, d. 1296) and Petrus de Bellapertica (Pierre de Belleperche, d. 1308), as well as with Cinus (Cino Sinibuldi da Pistoia, 1270–1336) who brought their techniques to Italy (Paradisi 1987; Bezemer 2005).

Two genres, *consilia* and commentaries, dominated later medieval Roman law writing and their dominance speaks to the increasing relevance (especially direct and pervasive in the cities of North-Central Italy) of jurisprudence to contemporary issues and real-world institutions, practices, and disputes. *Consilia* were opinions dealing with particular cases, written by consulting jurists either on behalf of clients party to disputes or in their capacity as impartial experts (*sapientes*) in the employ of judges, magistracies, and institutions. These opinions transcended their ad hoc origins, were gathered and distributed as collections, and the reasoning and legal findings contained in them were commonly used to establish juridical consensus (Ascheri et al. 1999). The greatest consultant of the fourteenth century was Baldus (Baldo degli Ubaldi, 1327–1400), who wrote more than 2,500 *consilia* (Canning 1987). Baldus's *consilia* were continually reprinted well into the early seventeenth century, and they formed an essential part of every Roman law library in the Renaissance, as to a lesser degree did the *consilia* collections of other famed consultants of the fifteenth century like Paolo da Castro, Bartolomeo Cipolla, and Alessandro Tartagni of Imola. Commentaries summarized and analyzed entire sections of the *Corpus iuris civilis*, raising and resolving problems, using the Accursian gloss and the lectures and opinions of other jurists as springboards for explanatory digressions and novel jurisprudential doctrines. Just as the gloss gave its name to an entire era of jurisprudence, the traditional jurists of the fourteenth to early sixteenth century are routinely called “commentators,” even when they worked predominantly in other genres. The most prominent commentator (and writer of treatises) of this era was Bartolus (Bartolo da Sassoferrato, 1313–1357), whose doctrines became central to Roman law practice in the fifteenth and sixteenth centuries (Cortese 1995; Calasso 1959). Scholarly consensus once held that the fourteenth century was the golden age of the commentators (chiefly Bartolus and his student Baldus, but also giants like Alberico da Rosate, 1290–1360; Luca da Penne, d. ca. 1390; and Bartolomeo da Saliceto, 1330–1412) and that the “Bartolist” (as a later derogatory term put it)

orthodoxy of the fifteenth and sixteenth centuries transformed traditional jurisprudence into sterile linguistic acrobatics and hackneyed recapitulations of authority, but the creative (and often vast) works of fifteenth- and early-sixteenth-century jurists (including Mariano and Bartolomeo Sozzini, 1401–1467 and 1436–1506; Bartolomeo Cipolla, ca. 1420–1475; Alessandro Tartagni, 1424–1477; Giasone del Maino, 1435–1519; Filippo Decio, 1454–1535; and others) stunningly refute this.

Lawyers of the late Middle Ages and Renaissance were often responsible for producing the statutes of self-governing cities and principalities, and they were tasked, by both governments and private clients, with navigating the often treacherous waters of the relationship between the *ius commune* and the statutes and customs of localities (*ius proprium*). University jurists in their learned works facilitated this act of interpretation, the bedrock upon which the entire edifice of Roman legal practice in the period was built and the backdrop against which the period's practical jurisprudence must be understood (Sbriccoli 1969; and, e.g., Tanzini 2004). The most widely read scholarship, especially in the Anglophone world and outside a tightly circumscribed world of specialists, has focused on the contribution of Italian lawyers like Bartolus to grand questions of political theory (comparative forms of government; the nature of and relationships among empire, papacy, kingship, and free cities; assemblies, representation, and consent) (Pennington 1993; Woolf 1913; Ryan 2000), but it was other issues that truly preoccupied the commentators and “Bartolists” and constituted the bulk of their works. Then as now the practice of law most often meant dealing with property: matters of inheritance and succession, including gifts, legacies, and trusts, predominated; and more likely than not they were inevitably entangled with issues of ownership and lesser rights to property, like leases and usufructs, as well as forms of real security; with debtor-creditor relations and interest; with contracts, especially for buying and selling; with family matters like paternal power, marriage, legitimacy, dowries, and guardianship (Kuehn 2017); with questions of citizenship and domicile

(Kirshner 2015), and with matters of government finance like taxation and public debt (Armstrong 2003). As a result of this, Roman law played an essential role (both substantively and procedurally) in litigation and civil trials, as well as in formal and informal dispute resolution and obviation; and it circumscribed and informed a ubiquitous notariate which, in advising and drawing up property-related instruments, was interposed between the world of university jurisprudence and that of everyday life. Roman law also had considerable influence on the development and practice of criminal law and procedure, with jurists devoting an abundance of works to crimes like homicide and theft, punishments like banishment, and to the knottiest elements of inquisition procedure like witness testimony, judicial torture, confession, and proof. This is not to suggest that Roman lawyers were uninterested in theoretical or philosophical questions. On the contrary, Roman law and its manifestation within the *ius commune* represented a multifaceted and profound philosophical system in and of itself. At the heart of this system, erected upon a latticework forged from the traditional techniques of scholastic dialectic and subtler expressions of topical logic, lay a whole set of sophisticated tools for defining rules and exceptions, for interpreting and discerning meaning, for devising and weighing arguments, for employing salubrious fictions and arriving at probable truths (Maclean 1992; Piano Mortari 1978).

Innovative and Original Aspects

By the end of the sixteenth century, the unity of the *ius commune*, to whatever extent such a thing had ever truly existed in a pan-European context, was fractured and dissolving. The dominance of earlier Italian works (the *opera omnia* of Bartolus chief among them), which had overshadowed the remainder of the production of Europe's major publishing centers (Venice, Lyon, Cologne, and Frankfurt) from the birth of print, was finally dwindling. Traditional forms and practices would continue to prevail in Italy and Spain, and to persist everywhere (even if in increasingly limited and recondite ways), but the jurisprudence of

early modern Europe came to be defined by the emergence and concretion of regional academic styles and *Rechtsräume*, with the Germano-Dutch and French spheres exerting the strongest influence. This protracted process of fragmentation and differentiation had many causes, but, within the context of Renaissance philosophical thought, none has loomed larger in legal-historical scholarship than the appearance of what is called "legal humanism" and its challenge to traditional jurisprudence. The earliest seeds of humanism found fertile soil in the lay notarial culture of medieval northern Italy, which was suffused with Roman law ideas, but, by the time of Petrarch (1304–1374), who famously abandoned his youthful legal studies and reviled lawyers for greedily selling their learning, humanism's relationship with the law had come to be marked by antagonism and competition for prestige (Manzin 1994). The vilification of lawyers was nothing new, but an original and distinct humanist critique of jurisprudence rapidly emerged in the middle decades of the fifteenth century. These criticisms could be directed at Justinian's compilation itself (as in the scathing attack on Tribonian's editorial work for the *Digest* mounted by Maffeo Vegio, 1406–1458), but they were more often aimed at perceived defects in the medieval legal tradition. Representative of the earliest stages of this movement was Lorenzo Valla (1407–1457), who infamously berated Bartolus for his barbarous Latin and for misunderstanding the law in a 1433 letter to Pier Candido Decembrio (1392–1477) (Cavallar et al., 1995); he also mounted a wider attack on the legists in his *Elegantiae*, a paean to classical style. Valla's own interest in law was passing at best, but, by the start of the next century, an *avant garde* of European jurists had begun in earnest the process of the philological restoration, historical contextualization, and philosophical reconceptualization of the *Corpus iuris* (Maffei 1956; Troje 1993). The first fruits of this project have come to be associated, above all, with the work of three men: Ulrich Zasius (1461–1536), Guillaume Budé (1467/8–1540), and Andrea Alciato (1492–1550), whose influence on French humanist jurisprudence (chiefly through his teaching at Bourges) was foundational. At its

core, legal humanism sought to excise later corruptions from the texts of Roman law and to eliminate or streamline the unwieldy and convoluted interpretations that had accumulated over the centuries; to return to the language, texts, and themes of classical jurisprudence. Legal humanists saw Roman law as a peerless witness to the thought and culture of antiquity, and they emphasized their own awareness (which they cast as novel) of the caesura between pre- and post-Justinianic law (*ius vetus* and *ius novum*). This emphasis and the techniques of historicization that it inspired and entailed were crucial to the development of the “science of history” and allow us to see legal humanism as a precursor to modern textual and scholarly practices (Kelley 1970).

The slow evolution of the text of the *Digest* represents one of the greatest triumphs of legal humanist textual practice, and its story is exemplary. Angelo Poliziano (1454–1494) began the process of collating the traditional vulgate *Digest* (the so-called *littera bononiensis*) with a unique, sixth-century codex of the *Digest* (the *littera florentina*), which had been held in Pisa from the twelfth to the early fifteenth century before being brought to Florence as priceless war booty. Poliziano’s unfinished work was taken up unsuccessfully by jurists like Pio Antonio Bartolini (d. early 1500s) and Lodovico Bolognini (1446–1508), and incompletely by Antonio Agustín (1517–1586, along with his friend and secretary Jean Matal, ca. 1517–1597), before Lelio Torelli (1489–1576) published an edition of the Pisan *Digest* in 1553 under the auspices of Cosimo I de’ Medici (1519–1574). Agustín and Torelli showed that every manuscript of the vulgate tradition ultimately derived from the Pisan manuscript, and readings from it would go on to be included in later printings of the *Corpus iuris*, including the influential and oft-reprinted 1583 edition of Denys Godefroy (1549–1622). Godefroy’s *Digest* was based, in part, on the dedicated work of legal humanists over the preceding century but, tellingly, nonetheless incorporated the marginal apparatus of the medieval tradition.

Legal historical scholarship often speaks of two inconsistent, if not entirely antithetical, methods of teaching law: the long-lived,

traditional *mos italicus* (Italian approach) and the new, humanist *mos gallicus* (French approach), so-called from the presence of a number of celebrated legal humanists (among them Eguinaire François known as Baro, ca. 1495–1550; Charles Du Moulin, 1500–1566; Jean Coras, 1513–1572; François Connan, 1508–1551; François Douaren, 1509–1559; François Baudouin, 1520–1573; Jacques Cujas, 1522–1590; and Hugues Doneau, 1527–1591) and the prominence of their techniques in French schools (Rossi 2008). This distinction, only cemented in the eighteenth and nineteenth centuries, remains a potent way of thinking about the development of legal scholarship. Through it sense can be easily made of the polemics waged by legal humanists against the most fundamental aspects of traditional practice, like the infamous attacks of Alciato against the publication of *consilia* and of Zasius against the system of juridical consensus (*communis opinio doctorum*); and of those waged by traditionalists against what they saw as the useless fripperies of the humanists, as in the sometimes scathing 1582 dialogues *De iuris interpretibus* of Alberico Gentili (1552–1590) (Gentili 1582), a Protestant émigré from Italy and Regius professor of civil law at Oxford (Astuti 1937). Yet the reality of sixteenth-century developments was more complex than a strict or simple *italicus-gallicus* division suggests, with humanist approaches gaining traction and influencing the practical jurisprudence of Italy and traditional ones enduring or being freshly implanted beyond the Alps. Indeed, the most intense and widest-scale acceptance of Roman law across Europe occurred precisely in this period of scholarly ferment, nowhere more notably than in Germany where its *Rezeption*, although met with some resistance, was thorough and profound and, outside of the university, usually much closer in spirit to the traditions of the *mos italicus* than to humanist philology (Coing 1939; Bender 1979). The allure of Roman law had always been intertwined with its rationality, and some legal humanists (like Connan and Doneau) dedicated themselves to its restatement in a more systematic and “scientific” form. At the same time, and notwithstanding the fact that Roman law practice

nowhere meant the wholesale overthrow of local custom and legislation, legal humanism's emphasis on the linkage between Roman culture in a long-lost historical epoch and its law eroded Roman law's claims to universal validity and encouraged jurists to aggrandize the status of custom and its own claims to authority, as in the celebrated 1573 *Francogallia* of François Hotman (1524–1590) and his earlier (though only published posthumously) and evocatively-titled *Antitribonianus*.

Impact and Legacy

Although Early Modernity would bring more radical changes, Renaissance *mos italicus* jurists and their more traditional and practically-minded ultramontane colleagues, largely unaffected by the challenge and promise of juridical humanism, went on manning influential courts and tribunals, teaching in important university faculties, and training generations of professional lawyers to administer institutions, perform justice, and conduct affairs of state (Martines 1968; Belloni 1986). And Roman law ideas went on to shape and influence an imponderable range of human activities and institutions. Much of the world today lives with legal systems that evolved directly (as in the nearly 150 “civil law” countries) or indirectly under the influence of Roman law, and this fact does not even begin to adumbrate Roman law's deepest resonances (as often chthonic and unspoken as discernable and openly acknowledged) in the imagination of the Western and wider world. Few if any distinct systems of thought have ever been farther-reaching or more influential in human history. The Renaissance in Europe powerfully shaped the process, begun in the Middle Ages, by which the law of Rome transcended its origins and historical bounds, and Rome's law in turn powerfully shaped the Renaissance in Europe.

Law of Free Fall in Renaissance Science

Carla Rita Palmerino

Radboud University Nijmegen, Nijmegen, The Netherlands

Abstract

The formulation of the laws of free fall and projectile motion is usually regarded as Galileo's most important scientific achievement. The new science of motion was however met with skepticism not only by Aristotelians but also by mechanical philosophers. After the publication of the *Dialogo sopra i due massimi sistemi del mondo* (1632) and the *Discorsi e dimostrazioni matematiche intorno a due nuove scienze* (1638), interesting discussions took place in Europe concerning the validity of the law of fall. The issues that were mostly debated were (a) the possibility of deriving that law from a causal explanation of gravity, (b) Galileo's views concerning the composition of continuous magnitudes, and (c) the alleged lack of empirical support in favor of the law.

Introduction

The first published formulation of Galileo's law of free fall is found in the *Dialogo sopra i due*

massimi sistemi del mondo (1632). On the second day of the work, Galileo claims that, in a naturally accelerated motion, the speed grows in proportion with the time elapsed and that the falling body acquires a new degree of speed in each of the infinite instants that compose a finite interval of time. Starting from these principles, Galileo formulates a law of fall which is valid in the void for all bodies, independently of their weight and material. The law states that the spaces traversed by a falling body are to each other as the squares of the times elapsed ($s_1:s_2 = t_1^2:t_2^2$) or, which amounts to the same, that the distances covered by a falling body in equal and successive intervals of time grow according to the series of the odd numbers starting from one (1, 3, 5, ...). Galileo claims that there is a “most purely mathematical proof of this statement” (Galilei 1967, 222), but he does not produce it. It is only in his last work, the *Discorsi e dimostrazioni matematiche intorno a due nuove scienze* (1638), that he offers a mathematical derivation of the law of free fall and of the semi-parabolic trajectory of projectiles.

Galileo’s new science of motion is rooted in a thorough criticism of some of the fundamental tenets of scholastic natural philosophy, such as the theory of natural places and the ensuing distinction between heavy and light bodies, the view that a force is needed to keep bodies in motion, the dichotomy between natural and violent motion, the idea that motion in the void is impossible, and the assumption that the speed of fall is proportional to the weight of the falling body.

Galileo’s derivation of the law of fall and of the parabolic trajectory of projectiles can certainly be regarded as a crucial episode in the process of mathematization of nature that took place in the seventeenth century. It is however important to point out that Galileo’s science of motion was met with skepticism not only by Aristotelian natural philosophers but also by some representatives of the mechanical philosophy. Following the publication of the *Dialogo* and the *Discorsi*, interesting discussions took place concerning the validity of the law of fall. The issues that were mostly debated were the possibility of deriving

that law from a causal explanation of gravity, Galileo’s views concerning the composition of continuous magnitudes, and the alleged lack of empirical support in favor of the law.

In this entry we shall first provide an account of Galileo’s discovery of the law of fall and then describe its impact and legacy.

Galileo’s Law of Free Fall: Heritage, Original Aspects, and Rupture with the Tradition

Galileo’s law of fall is often translated in the equation: $s = \frac{1}{2} gt^2$. This formula is, however, anachronistic, as Galileo relied on the medieval theory of proportions, which only permits the expression of ratios between homogeneous magnitudes (Giusti 1990, xxix; Damerow et al. 2004, 254–256). This explains the resemblance between the diagrams accompanying Galileo’s demonstrations and those used in the fourteenth century by Nicholas Oresme to describe the uniform variation of qualities (Palmerino 2010b).

In his *Tractatus de configurationibus qualitatum et motuum*, Oresme offered a diagrammatic representation of the theory of the intension and remission of intensive qualities (such as color, sound, heat, and velocity) which had been developed by the *Calculatores* at Merton College, Oxford (Maier 1949; Sylla 1986; Damerow et al. 2004, 17–21).

In Fig. 1, which represents the so-called mean speed theorem, Oresme compares a motion of

Law of Free Fall in Renaissance Science, Fig. 1 Oresme’s representation of the “Mean Speed Theorem”

uniformly changing speed (CAB) with a uniform motion (FGBA). The horizontal line AB stands for the duration of the two motions, the vertical lines (perpendicular to AB) represent the intensity of the velocity at the various instants of time, whereas the areas of the two figures stand for the “total velocity,” which coincides with the space traversed (Oresme 1968, 279). Given that the areas of the figures CAB and FGBA are equal, Oresme concludes that the two motions under comparison traverse equal spaces at equal times.

The mean speed theorem plays a crucial role in the *Discorsi*. As noted by Richard Arthur, Galileo “appropriates the idea initiated by the Merton School that a motion has a certain intensity at any given instant” and that all the “degrees of velocity” add up to the overall velocity of the motion of fall (Arthur 2016, 89). In the *Discorsi*, Galileo defines naturally accelerated motion as one “which, abandoning rest, adds on to itself equal momenta of swiftness in equal times” (Galilei 1989, 162). This definition is followed by a postulate and by a number of propositions that are “proven demonstratively” (Galilei 1989, 165). Proposition I, Theorem I is precisely the Mean Speed Theorem, which Galileo demonstrates with the help of Fig. 2 above. Here the vertical line AB represents the time of fall, the horizontal lines EB and FB the final speeds of the accelerated and uniform motion respectively, and the lines parallel to EB stand for the degrees of speed. The areas of the triangle and of the rectangle are identified by Galileo with the total speed, which is proportional to the space traversed, represented by the separate line CD (Damerow et al. 2004, 238–242).

The mean speed theorem lies at the basis of Galileo’s demonstration of the time-squared law in Proposition II, Theorem II, and the odd numbers law in Corollary I (Fig. 3). In order to persuade his interlocutors that the law of fall, demonstrated in Theorem 2, is not only valid in abstracto but also applies to the real world, Salviati describes the result of the famous inclined plane experiment which “repeated a full hundred times,” always showed the spaces “to be to one another as the squares of the times” (Galilei 1989, 170).

Law of Free Fall in Renaissance Science, Fig. 2 Galileo’s representation of the “Mean Speed Theorem”

We know that Galileo had discovered the time-squared law as early as 1604. In a letter to Paolo Sarpi written in October of that year, he curiously derived that law from the false assumption that the speed of fall grows in proportion to the space traversed, rather than to the time elapsed. Scholars have provided different interpretations of Galileo’s mistake and of the way in which he managed to recognize and correct it (Drake 1974; Galluzzi 1979, 272; Mahoney 1985, 206–207; Giusti 1990, xxv–xxvi; Blay and Festa 1998, 75–76; Damerow et al. 2004, 165–175; Palmerino 2010b, 419–425; Arthur 2016, 90–91).

It is interesting to point out that a similar mistake was made by René Descartes, who in 1618 explored the issue of free-fall together with Isaac Beeckman. In a letter to Mersenne, dated 13 November 1629, Descartes maintained that falling bodies are impelled downward by gravity, which adds to them a new impetus in each

Law of Free Fall in Renaissance Science, Fig. 3 Galileo's representation of the odd numbers law

successive moment of time (Mersenne 1945–1988, 2: 316–317; Descartes 1964–1974, 1: 71–72).

Descartes illustrated this principle by means of Fig. 4, in which the vertical lines 1, 2, 3, 4 . . . stand for the forces acquired in successive moments of time by a body falling from A to C. By comparing the areas of the triangle ABE and the trapezium BCDE, which represent the increase of speed over the distances AB and BC, respectively, Descartes concluded that the time required to cross the distance AB was three times longer than the time required for BC. This conclusion was based on a rule valid for uniform motion, according to which for equal spaces velocities are inversely proportional to the time elapsed (Damerow et al. 2004, 61). When Descartes first read the *Dialogue*, in 1634, he did not perceive the difference between the law he had formulated in

Law of Free Fall in Renaissance Science, Fig. 4 Descartes' representation of the law of fall

1629 and Galileo's law. In a letter to Mersenne dated 14 August 1634, Descartes declared that he had recognized in the *Dialogue* "some of his own thoughts," such as that "if a ball employs three moments to descent from A to B, it will employ only one moment to fall from B to C" (Mersenne 1945–1988, 4: 298; Descartes 1964–1974, 1: 304–305). Descartes did not realize that while in his own figure the vertical line AC represents the distance fallen, and the spaces AB and AC are supposed to be traversed in times that are to each other in a proportion of 3 to 4, in Galileo's triangle of speeds the vertical line is taken to represent time, and the spaces traversed are supposed to be in the same proportion as the squares of the times elapsed (Damerow et al. 2004, 37; Jullien and Charrak 2002, 147–148).

But what is especially interesting from our point of view is the fact that by 1634, Descartes had lost interest in the formulation of a law of free fall. As we will see in the following section, he believed, like other contemporaries, that a causal analysis of free-fall should be given priority above the mathematical description of the phenomenon.

Impact and Legacy of Galileo's Law of Fall

In 1633, Marin Mersenne published a short pamphlet entitled *Traité des mouvements, et de la*

cheute des corps pesans in which he presented some “veritable experiences” (*expériences véritables*) in support of Galileo’s law of free fall (Mersenne 1633, 2). Having measured the time employed by a laden ball falling from different heights, Mersenne had verified that the spaces grow as the squares of the times (Dear 1984, 136–137; Dear 1995, 129–132; Palmerino 2010a).

The last pages of the *Traité* are devoted to exploring the nature of gravity. Mersenne takes into account three possible causes of free fall, notably “positive and real heaviness,” the pressure of the air on the falling object, and terrestrial attraction, all of which seem however incompatible with Galileo’s law of free fall. Mersenne concludes that “it is sufficient to explain the phenomena of nature, since the human spirit is not capable of possessing its causes and principles” (Mersenne 1633, 21–24). This stance was in agreement with that of Galileo, who in the *Dialogue* had confessed his ignorance concerning the nature of gravity (Galilei 1967, 234).

Mersenne’s attitude toward Galileo’s law of free fall was to shift over the years, from “pragmatic adoption” (Dear 1984, 215) to skepticism. In the *Novarum observationum ... tomus III*, published in 1647, Mersenne still stressed that bodies dropped from modest altitudes appeared to follow the odd number law but pointed out that the validity of that law could not be demonstrated as long as the true cause of gravity remained unknown (Mersenne 1647, 133).

Mersenne’s change of mind can only be understood against the background of the debate concerning Galileo’s science of motion that took place in Europe after the publication of the *Dialogo* and the *Discorsi*. An important actor in this debate was Pierre Gassendi, who between 1640 and 1646 wrote six Latin letters, the *Epistolae de motu impresso a motore translato* (1642) and the *Epistolae de proportionibus quae gravia decidentia accelerantur* (1646), in which he adduced new experimental evidence in favor of Galileo’s science of motion and attempted to show how the *vis attrahens* of the earth could produce an acceleration according to the law of the odd numbers (Galluzzi 2000; Palmerino 2004).

Contrary to Gassendi, René Descartes believed that Galileo’s law of fall was incompatible with a mechanistic explanation of gravity. According to the theory presented in the posthumously published *Le Monde* and in the *Principia philosophiae* (1644), bodies were pushed downward by the particles of subtle matter contained in the terrestrial vortex. Descartes confessed his incapacity to translate this complex mechanism into an exact mathematical law, but expressed the conviction that the clashes between subtle matter and falling bodies produced an acceleration in jumps, rather than a uniform and continuous acceleration (Palmerino 1999; Jullien and Charrak 2002).

Between 1644 and 1646, three authors tried to formulate an alternative to Galileo’s law of fall.

In 1645 the Jesuit Pierre Le Cazre reacted to Gassendi’s *Epistolae de motu* with a *Physica demonstratio*, in which he claimed to have verified experimentally that the speed of fall grew in proportion to space. On the basis of an incoherent piece of mathematical reasoning, Cazre concluded that the distances covered by a falling body in equal and successive intervals of time grew according to the series of ever-doubling numbers (1, 2, 4, 8, ...) (Palmerino 2003).

A more coherent and interesting account of free fall was proposed by another Jesuit, Honoré Fabri. In the *Tractatus physicus de motu locali*, published in 1646 by his pupil Pierre Mousnier, Fabri identified the cause of free fall in the impetus produced by gravity. Fabri explained that while gravity remained constant, a new degree of impetus, and hence a new degree of speed, was acquired in each of the finite instants composing time. According to Fabri’s “discretist” account of free fall, each new degree of speed is enough to traverse a new minimum of space, which means that the spaces traversed in equal and successive instants of time grow according to the series of natural numbers (1, 2, 3, 4) (Palmerino 2003; Elazar 2011; Arthur 2016).

Giovan Battista Baliani reached a similar conclusion in the second edition of his *De motu*, which was also published in 1646. While in the first edition (1638) he had subscribed to the

Galilean law of free fall, he now argued, like Fabri, that gravity adds to falling bodies a new impetus in each successive finite instant of time and that the acceleration of fall takes place according to the series of the natural numbers (Baliani 1998).

But what about the experiments that seemed to confirm the validity of Galileo's law? To Mersenne, who asked this question, Fabri answered that in order to obtain empirical confirmation of the law of natural numbers one should have taken as one's unit of measure a minimum of time. Given that "in actual experience one can but take a part which contains several instants of time (...) one should not be surprised if the proportion found by experience corresponds more or less to that of Galileo" (Mersenne 1945–1988, 12: 289).

Fabri's answer shed light on a peculiar characteristic of Galileo's law of free fall, notably the fact that it was valid irrespective of the unit chosen to measure time. Interestingly, precisely this property was regarded by some as proof of the superiority of Galileo's law over its rivals. In their letters to Mersenne, Theodore Deschamps, Evangelista Torricelli, and the young Christiaan Huygens stressed the fact that the odd number law was the only one to possess the property of scalar invariance (Palmerino 1999). But this argument was not enough to convince Mersenne. What was at stake in the debate was the continuity of acceleration, and the odd numbers law was invariant precisely because it described a continuous acceleration.

Many of the difficulties which Galileo had encountered in the derivation of the law of free fall were superseded by the invention of the infinitesimal calculus. In the *Principia* (1687) Newton successfully applied the new method to the study of accelerated motion and managed to "avoid long and tiresomely rigorous demonstrations in the style of the ancients, as well as the traps posed by indivisibles" (Blay 1998, 59). This, however, did not put an end to the debate concerning the cause of free fall. As is well known, Leibniz as well as Descartes' followers rejected Newton's theory of gravity, which involved action at a distance, for

being incompatible with the principles of mechanical philosophy.

Law, Renaissance Idea of Natural

Maarten Van Dyck

Department of Philosophy and Moral Science,
Ghent University, Ghent, Belgium

Abstract

The introduction of laws of nature is often seen as one of the hallmarks of the scientific revolution of the seventeenth century. The new sciences are thought to have introduced the revolutionary idea that explanations of natural phenomena have to be grounded in exceptionless regularities of universal scope, i.e., laws of nature. The use of legal terminology to talk about natural regularities has a longer history, though. This article traces these earlier uses.

Introduction

The introduction of laws of nature is often seen as one of the hallmarks of the scientific revolution of the seventeenth century. Aristotelian natural philosophy ascribed specific forms to the different kinds of things in nature to explain their behavior. For example, the form “oak tree” explains why a particular oak tree loses its leaves in autumn, by inhering in it as an intrinsic power. The new sciences are thought to have introduced the revolutionary idea that there are exceptionless regularities of universal scope that are doing the main explanatory work (possibly with the

additional claim that these regularities are mathematical in nature). These explanations assume a much greater material homogeneity in nature and do not ground explanations in natural kinds that would themselves be directly observable. The paradigmatic formulation of this ideal is found in Descartes' *Principia Philosophiae* from 1644, where Descartes introduced three laws of nature, grounded in the unchanging nature of God, that govern the behavior of all material bodies. Starting from these laws, one supposedly can deduce a number of consequences (central among the mathematical rules characterizing the collision between bodies) which in turn help explain a whole array of natural phenomena.

In investigating the history of the idea of laws of nature, a number of distinctions have to be drawn. It is one thing to search for a certain kind of regularities, such as Galileo's "law" of free fall (never so-called by him), and possibly quite another to interpret these regularities as being laws of nature. It is again one thing to call a natural regularity a "law" or a "law of nature" and possibly quite another to use this terminology to refer to a precise philosophical concept, such as Descartes'. And it is open to debate to what extent Descartes' writings even came close to capturing the core of an idea that was effective in shaping the new sciences of the seventeenth century – even if Newton seems to have thought so in calling the axioms of his *Philosophiae Naturalis Principia Mathematica* "laws of motion." (See Steinle 1995 and especially Roux 2001 for further reflections and a useful overview of the different uses of the terminology in the seventeenth century. Daston and Stolleis 2008, Hartbecke and Schütte 2006, and Watkins 2013 are recent collections that offer excellent entry points to many facets of the history of the idea.) The search for the "origins of laws of nature" (once a popular topic in historiography Milton 1981; Oakley 1961; Ruby 1986; Zilsel 1942) is consequently fraught with difficulties and possibly ill-conceived (but see Henry 2004; Schnepf 2006 for recent contributions to this debate). In what follows we will start with a more simple task: to trace the use of legal terminology to refer to different aspects of natural regularity before the seventeenth century.

Heritage

Ancient Philosophy

Apart from a passing remark in the *Timaeus* (Zilsel 1942, p. 250), legal terminology was not used by Plato or Aristotle to talk about natural regularities (though it is worth pointing out that the whole creation story in the *Timaeus* unfolds within a political context, a connection not missed by Francisco Suárez in the sixteenth century (see Armogathe 2008, pp. 271–272). The most extensive use is found in Lucretius' *De Rerum Naturae*. Lucretius repeatedly talked about "foedera naturae," "treaties of nature," as a kind of mutually constraining relationships between things in nature that set inviolable limits to their respective powers (Asmis 2008b). These treaties allow each kind of thing to flourish in its own way, within its own domain, and "without participation by the gods" (quoted in Asmis 2008b, p. 147). Strikingly different from Lucretius, the Stoics stressed that all order in nature is the result of Divine governance that has imposed a rational structure upon it. They also extensively used legal talk to characterize order in nature, but only when discussing the moral realm, with "natural law" the commanding rational force that guides human beings in their moral behavior. It has even been pointed out that from a Stoic perspective the addition "of nature" to "law" is strictly speaking redundant (Asmis 2008a, p. 3).

Talk about "laws of nature" to refer to natural regularities seems not to have gathered much momentum in antiquity, but it was not completely uncommon either. Latin authors did speak about the "laws" or "laws of nature" according to which certain geographical locations allow the growth of particular crops (Vergil), by which the stars move (Ovid, Manilius), according to which rivers flow downhill (Ovid), or that govern the regularity of the winds (Pliny) (Lehoux 2006, pp. 537–538).

Early Christianity

The Stoic idea of Divine governance was Christianized by early Christian authors, but they also included natural regularities under this Divine legal administration (Crombie 1996, pp. 70–75 for Philo of Alexandria and Augustine,

Wilson 2008, p. 19 for Lactantius, Chesnut 1986, pp. 43–44 for Eusebius). In doing this, they were not only following the example set by authors like Ovid and Pliny, but more importantly that of biblical passages, such as one from the book of Job where it is stated that “God made a decree for the rain” (Armogathe 2008, pp. 274–276). The following quote from Augustine’s *De Genesi ad litteram* nicely sums up his view: “The most customary course of all this nature has certain natural laws of its own according to which both the spirit of life, which is in a creature, has in some way certain settled desires of its own, which even malevolence cannot overcome, and the elements of this corporeal world have their settled power and quality, what any of them may or may not effect and what may or may not come from what” (Quoted in Crombie 1996, p. 73). Augustine furthermore used the expression of God’s “eternal law” as the Divine “ratio or will” by which the conservation of the natural order is decreed, and its disturbance forbidden, introducing crucial ideas that would shape scholastic discussions (Specht 2001, p. 67).

The Medieval Scholastics

In Thomas of Aquino we find the most elaborate treatment of the idea that God ordered the whole of nature by an “eternal law.” Insofar as this law can be understood by a rational creature in whose mind it is inscribed, it constitutes “natural law” that provides the creature with normative reasons for acting; nonrational creatures can only be said to participate in eternal law analogically, through the causal dispositions that have been imprinted in them (Adams 2013, pp. 9–10). In opposition to Thomas, Scotus and Ockham limited the application of law terminology to voluntary agents and saw no place for the analogical extension to the rest of nature (Adams 2013, p. 24). More generally, the Scotist tradition doubted whether it made sense to speak of an eternal law, which is somehow in God (Armogathe 2008, pp. 266–269).

A closely related topic was the distinction between God’s absolute power and his ordained power, the former his unlimited power considered in abstraction from his will, the latter his power as it expresses itself in the order given to the world.

Considered as ordained, God freely chooses to limit his power, binding himself to the order he has willed for the world. The distinction between both aspects of Divine power was also increasingly understood in legal terms from Scotus onward, by linking it with the distinction between acting according to the law (ordained power) and God’s ability to act apart from the law (absolute power) (Courtenay 1985, pp. 251–254; Funkenstein 1986, pp. 132–133). In this way the order established through God’s ordained power can again be understood as having the nature of law, this time a law to which God has freely bound himself rather than one in which nonrational entities “participate” (Crombie 1996, pp. 80–81).

Another distinction that could be expressed using legal terminology was the difference between particular and universal nature. This distinction, which was regularly appealed to from the thirteenth century onward, was used to explain many phenomena in nature where a thing’s particular nature is constrained or overturned by the broader frame of “universal nature” to guarantee that the thing’s behavior contributes to the order of the whole of nature (e.g., Roger Bacon uses it to explain why the water in a clepsydra rises in order to avoid the formation of a vacuum, contrary to its particular tendency toward downward motion, and Albertus Magnus uses it to explain why all natural beings will perish even if their particular nature does not aim at corruption) (Manzo 2013). Bacon, who attributed the distinction to Avicenna, explicitly talked about the “law of universal nature” that overturns the bodies’ particular nature (Schramm 1981, p. 203).

The Mathematical Tradition

It was not uncommon for medieval authors to designate general rules of a discipline as “laws,” e.g., the *lex contradictionis* for the principle of noncontradiction. It has been suggested that this lies at the origin of Roger Bacon’s consistent use of *lex* to express the regularities established in his optics, such as the laws of reflection and refraction (Ruby 1986, p. 349). Interestingly, Bacon also connected this more restricted use of the terminology to the distinction between laws of particular and of universal nature in a passage where the

geometrically demonstrated “law of refraction,” a “common law of nature,” is overturned once the optical species reaches the optic nerve, “so that it should not transgress the laws which nature keeps in the bodies of the world” (Crombie 1996, p. 76).

Innovation

Laws for Nonrational Entities

The question of whether nonrational entities can properly be said to operate according to laws remained a contentious one within late scholastic philosophy. For Francisco Suárez, e.g., the situation was clear from the point of view of philosophy of law: this could only be stated in a “metaphorical” way (surely not to be conflated with Aquino’s analogical participation), as true laws required both a command and a capacity to obey (Courtine 1999, pp. 106–107). At the same time, when discussing metaphysical issues, he abundantly used law-talk in describing God’s establishment and maintenance of order in the natural world through his permanent “concursus” (Specht 1987). This can be understood following the earlier mentioned association of the distinction between ordained and absolute power with acting according to law and acting apart from law: the lawful behavior in the natural world is in the first place God’s who has freely chosen to bind himself to law, to uphold his “promise” toward natural entities to continually assist them in carrying out their established roles in the system of the world (Specht 2001, pp. 70–71).

Suárez also discussed (without endorsing) a different model on which the natural world could be seen as law-governed: by making the distinction between two kinds of law, *lex morum* and *lex artificiorum*. He explained “all that God does relates to God as an artifact does to its artisan. In the same way that the idea of the artisan can be called a law which imposes itself to produce artifacts that conform to that idea, this eternal law is the idea by which God as supreme artisan decides how to establish all things for all of eternity.” (As quoted in Armogathe 2008, p. 274, see also Courtine 1999, p. 109 for the context of this quote.)

Other authors saw no problem in talking about nonrational entities observing laws, as the example of Richard Hooker shows “Whereas therefore things naturall which are not in the number of voluntarie agents . . . do so necessarily observe their certaine lawes, that as long as they keepe those formes which give them their being, they cannot possible be apt or inclinable to do otherwise than they do” (as quoted in Milton 2012, p. 681). Hooker’s text dropped Thomas’ careful reference to “analogical participation,” and it also testifies to a further terminological shift, as he called the collection of these laws “natures law” and “law of nature” while he reserved “law of reason” for what most of the tradition called *lex naturalis* (Hooker 1593, pp. 51–52). But when Hooker explained “what that is which keepeth nature in obedience to her owne law,” we have to return to God, since “those things which nature is said to do, are by divine arte performed, using nature as an instrument,” coming very close to the option discussed but discarded by Suárez (Hooker 1593, pp. 53–54).

The discussions in Suárez and Hooker testify to the continual shifting between “law” as that “rule of working which superior authority imposeth,” which necessarily implies notions of command and obedience, and “law” as also being applicable to “any kind of rule or Canon whereby actions are framed” (Hooker 1593, p. 51). But as Hooker’s example shows, laws of nature as regularities in the behavior of nonrational entities were also firmly anchored in (or “framed by”) Divine agency.

The Necessity of Universal Laws

Laws were often called “certa,” “infallibilis” (see, e.g., the examples in Suárez quoted in (Specht 1987, p. 419), or “necessary” (see the quote by Hooker given above). At the same time, Aristotelian natural philosophy did allow for exceptions to regular natural behavior. This shows the relative distance between the metaphysical notion of law-governed behavior (whether God’s or natural entities’) and the explanations based on natural kinds in natural philosophy that had to take into account the variety of natural circumstances under which particular

phenomena take place (which could conceivably lead to an oak tree losing its leaves in summer rather than in autumn).

Renaissance authors were often keen to distinguish between different kinds of necessity that accrue to different kinds of causes, which also involved the distinction between universal and particular nature. The Wittenberg philosopher Bernhadi Velcurio, e.g., distinguished between fate “as a perpetual order of causes and events, depending on the providence of God as a primary cause, imposing inevitable necessity on fatal things” and nature “as the principle and cause of motion and rest in things that have that principle in themselves *per se* and not *per accidens*” (quoted in Kusakawa 2008, p. 108). At the level of the natural world, “physical fate” shows itself in the general principle of universal nature that dictates the conservation of species, which mirrors the perpetual motion of the heavens (Kusakawa 2008, p. 110). It is at the level of these general principles rather than that of particular behavior guided by internal natures that strict necessity can be found. These ideas were by no means limited to a protestant context, as shown by Jacopo Zabarella, who used explicitly legal language to express this distinction, defining fate as a “law laid down by the universal nature for every thing to be generated and corrupted,” a law “which cannot be set aside” (quoted in Manzo 2013, p. 27, p. 26). Zabarella’s language in turn found its way in Goclenius the Elder’s *Philosophicum Lexicon* from 1613 (Kusakawa 2008, pp. 119–120).

The operation of universal nature was usually thought to be mediated by the celestial realm, a position also upheld by Suárez (Manzo 2013, p. 24). This dovetailed nicely with the higher degree of necessity that could be observed in celestial motions. It has also been pointed out that, possibly, for this reason, Philip Melancthon reserved the language of laws to describe celestial regularities, whereas he used “regula” for sublunary regularities (Kusakawa 2008, pp. 114–115).

The Mathematical Tradition

It is very common to find law-talk in sixteenth-century mathematical astronomy, which can be

linked to the etymological explanation of astronomy as the study of the *lex astrorum* (Ruby 1986, pp. 352–357; Roux 2001, pp. 548–550). The example set by an author like Manilius may have played a further role, but the frequent characterization of laws as being “certa” and “unchanging” or “perpetual” also suggests a philosophical inspiration. One also finds astronomers talking about the “laws of motion” of planets (Copernicus, Peucer). In optics, we find Kepler using designations like “law of reflection,” “law of propagation,” and more generally “optical laws” frequently (Ruby 1986, p. 351; Roux 2001, p. 549). In mechanics, the situation is different. Sixteenth-century authors seem not to have talked about, e.g., the “law of the lever,” although Kepler talks about the lever as providing the “*exemplum*” for the “laws” that characterize the speed and slowness of planets (Roux 2001, p. 549, fn. 57). The fact that mechanical instruments allow humans to constrain heavy bodies to move against their nature by using only a small force is most commonly expressed by calling these effects “*praeter naturam*” or “*contra natura*,” but sometimes they are also called “*praeter naturae legem*,” or it is stated that “*ars naturae transgressa leges*” (Festa and Roux 2001, p. 243).

Legacy

Using legal terminology to talk about natural order was not unexceptional in antiquity and the middle ages. It could present itself both as a rather natural way of speaking, without necessarily involving many metaphysical subtleties (as testified by the Latin authors and also partly by the patristic tradition), and as part of a highly developed metaphysical framework (as testified by the scholastics). Renaissance thinkers picked up on both these strands.

The astronomers’ frequent use of “law” probably played a role in the attractiveness of this terminology for the *novatores* of the seventeenth century, who were fascinated by the possibility of describing natural order in mathematical terms. The late scholastic discussions also left their marks, though. The mathematicians’ use of

“law” often limited the scope of a law to, e.g., the planet of which it was the law (Roux 2001, pp. 548–549), whereas the universal scope of early modern “laws of nature” seems more closely related to the focus on “the law of universal nature” that characterizes many late scholastic discussions. It is the latter stress on universal lawfulness that involves the more far-reaching reconfiguration of Aristotelian philosophy. In this respect, it is suggestive to point out that the law of universal nature of late scholastic philosophy could be formulated as a conservation principle, as were Descartes’ laws of nature. The nature of that which is conserved is of course crucially different in both cases because of the complete disappearance of specific forms in Descartes, with far-reaching consequences for the question of where to locate causal activity in the world – putting a much greater explanatory burden on the universal laws (which are now even characterized as “particular” causes by Descartes in distinction from the “universal” and primary cause, God’s immutability, see Chene 2000, pp. 152–153 for some comments). But as pointed out in the introduction, there is no reason why we should take Descartes as the final word on the matter. Throughout the seventeenth century, authors frequently keep on using “law” in a more restricted, specific – and often biblical – sense (see Wilson 2008, pp. 21–22 for just some examples: Charleton, Culverwel, Locke). Laws of restricted scope could also be formulated in terms of abstract, mathematical parameters, closer in spirit to the mathematical usage we found in Roger Bacon and Kepler than to the biblical law of the winds and the seas. The hierarchical relation between particular and universal laws also recurs, e.g., in Boyle’s distinction between specific, “municipal” laws and “fundamental” ones which can overturn the former (Steinle 1995, pp. 337–338).

The puzzle concerning the applicability of legal terminology to talk about natural order also kept on recurring. Suárez’s explicit denial of its validity was echoed by Boyle (Crombie 1996, p. 85), who just like Suárez went on to use it nonetheless. As we saw, the tendency to interpret the law-governed behavior as being ultimately God’s, either as linked to his concurrent action

implied by his ordained power or to his instrumental use of nature, had become more or less commonplace in the Renaissance. Again, both approaches would endure in the seventeenth century (see Crombie 1996; Oakley 1961; Specht 2001).

Le Douaren, François

Born: 1509, Moncontour

Died: 1559, Bourges

Xavier Prévost

Faculté de droit et science politique, Université de Bordeaux, Pessac, Cedex, France

Abstract

François Le Douaren, a French jurist of the sixteenth century, is one of the greatest representatives of legal humanism. In his books (four volumes in folio for his *opera omnia*), he applies a systematic method in which criticizes the structure of the *Corpus Juris Civilis* and breaks with the scholastic method of medieval jurisprudence.

Synonyms

Franciscus Duarenus; François Duaren

Biography

François Le Douaren was a French jurist of the sixteenth century, born in 1509 in Moncontour (Brittany) and died in 1559 in Bourges (Berry). His father – a judge in Brittany – was linked with Guillaume Budé, one of the greatest figures of humanism in France, who had a huge influence on Le Douaren. Thanks to him, he studied in Paris, but it is not known where he learned law. After his studies, he taught in Paris, where he was notably the master of the sons of his famous

protector. From 1538, he was a professor of civil law at the prestigious University of Bourges, which was however less brilliant since the departure of Andrea Alciato. François Le Douaren contributed to rebuilding the faculty as the center of the legal studies reform. Indeed, Marguerite de Navarre, Duchess of Berry, tried to draw to Bourges the best humanist jurists. Nonetheless, the harmony with each other was often disturbed, due to methodological and personal disagreements. Thus, Le Douaren quarreled with his colleague, Éguiner Baron, who led him to leave the university in 1547. He became then a lawyer in Paris, but he came back to Bourges in 1550 after Baron's death. Then, he came quickly into conflict with another humanist, François Baudouin, who had replaced him two years before. This time, his opponent left, but Le Douaren opposed the new professor, namely, Jacques Cujas. So, Cujas resigned himself to leave in 1557, two years after his appointment. Le Douaren ended his career at Bourges, renowned in Europe as one of the greatest jurists of the time.

In his works, François Le Douaren applies humanist principles to legal studies. Consequently, he breaks with the scholastic method of medieval jurisprudence. He wants to come back to the sources of Roman law. But, according to him, the *Corpus Juris Civilis* presents the sources in an incoherent way. He criticizes Justinian's compilations and tries, in his writings, to study Roman law following a rational method. So, he appears as one of the greatest representatives of the systematist current of legal humanism. This current was influenced by the famous passage "*jus ad artem redigere*" by Cicero. Its upholders, such as Le Douaren, wanted to expound the law in a logical order according to a deductive approach. Thus, the French humanist considers that law has to be studied and taught from general to specific.

Among the humanist features of Le Douaren's works, his search for a perfect "classical" Latin should be noted. He reproaches his predecessors, i.e. the glossators and commentators, for their poor knowledge of the language, which led to misunderstanding the sense of the Roman texts. In a humanist manner, he also uses Greek sources. The systematist approach is indeed coupled with a critical analysis

of the sources in order to find the true sense of the texts of the *Corpus Juris Civilis*. The method of Le Douaren explains also the importance given to the *Institutes of Justinian*. For instance, he wants to improve their teaching. According to him, the knowledge of the *Institutes* is an essential prerequisite for the study of the *Digest* and the *Code*.

The prolific works of François Le Douaren (four volumes in folio in the edition of 1765–1768) are recognized, during his life, as innovative and very erudite. After his death, his *opera omnia* has been reprinted numerous times, which proves their spreading through Europe. Moreover, his method has been improved by his pupil Hugues Doneau, who has influenced Grotius. Consequently, Le Douaren had a legacy in the European legal orders of modern times thanks to the school of natural law.

Le Fèvre, Tanneguy

Born: 1615, Caen

Died: Sept. 12, 1672, Saumur

Luigi-Alberto Sanchi

CNRS, Institut d'histoire du droit, Paris, France

Abstract

Father of the celebrated French scholar Madame Dacier, Tanneguy Le Fèvre was a

professor of Greek and a classical scholar at the Protestant Academy in Saumur, France. He published and translated several Greek and Latin works and proposed bold emendations to Greek and Latin texts. He also wrote essays, of which the *Lives of the Greek Poets* became notorious for his tentative to defend Sappho's morals was attacked by a Saumur theologian.

Alternate Names

Faber; Lefebvre; Lefèvre; Tanaguidus; Tanaquil; Tanaquillus

Biography

Tanneguy Le Fèvre was born in Caen in the year 1615, the exact date being unknown (Bourchenin 1882; Hemmerdinger 2009), in the parish of Saint Jean (Segrais 1723; Hemmerdinger 2009). The son of a grave digger, he had the opportunity to study under the supervision of an uncle of his, a highly educated churchman. Le Fèvre was only trained in music until the age of twelve; he was then taught Latin, which he quickly learned to a good proficiency, and pretended he learned ancient Greek alone (Weiss 1819; Itti 2012). Thus, Le Fèvre was admitted at the demanding Jesuit school "Collège de La Flèche." His professors, his father, and his uncle would have him stay in La Flèche and become a churchman, in vain (Weiss 1819); according to other sources, Le Fèvre spent some time as a clergyman in Caen's Saint Jean parish (Huet 1702).

Thanks to a friend of his, François Sublet de Noyers, a higher civil servant, Le Fèvre was introduced to Cardinal Richelieu, who appointed him at the Louvre printing works as a "general editor" (Graverol 1686; Weiss 1819; Itti 2012), maybe a low-level task (Ribard 2008). However, after Richelieu's death (1642), Le Fèvre went to Langres, following a new patron, the Marquis of Francières, and became a Huguenot (Weiss 1819; Bury 1991).

The Saumur Protestant Academy offered him to be a professor. There he taught ancient Greek, published several Greek and Latin editions and translations, wrote original essays (see list in Weiss 1819), and attended to the education of the children he had from his marriage with Marie Olivier. The most famous and brilliant of them is Anne Le Fèvre, the future Madame Dacier. Tanneguy Le Fèvre died from a severe fever on Sept. 12, 1672, aged 57, and while considering whether to move to Heidelberg, since he was offered a chair at the local Academy by the Elector of the Palatinate (Huet 1702; Hemmerdinger 2009).

Posterity remembers various aspects of Le Fèvre's legacy. His controversial defense of Sappho's morals published in his *Les Vies des poètes grecs* (Le Fèvre 1665b) was attacked by an Academy of Saumur theologian (Rüdiger 1933), but it has to be regarded as a pioneer effort to understand ancient Greek way of life and literature. Le Fèvre successfully translated Machiavelli's comedy *Le Mariage de Belphegor* (Le Fèvre 1665b; Le Fèvre et al. 1969). His bold emendations to Greek and Latin texts were discussed by letter (Le Fèvre 1659, 1665a) and through literary revues during his lifetime (Weiss 1819) and still convinced such great a scholar as Richard Bentley (Hemmerdinger 2009). Le Fèvre's most celebrated successor is his daughter Anne, who chose many of her scholarly subjects from his father's work (Itti 2012).

Le Loyer, Pierre

Born: 24th November 1550, Huil  (Anjou)

Died: 27th January 1634, Angers

Deborah Miglietta

Laboratoire d’Etudes des Monoth ismes, CNRS,
Paris, France

Abstract

French lawyer, demonographer, and scholar Le Loyer intends to build a real encyclopedia of the apparitions, based on the old, medieval, and contemporary texts. To this syncretism, he adds a legal doctrine. His contribution to demonology consists mainly in the efforts to explore its phenomena scientifically. Thus, the witches, specters, ghosts, and demons take on in his writings an epistemological value.

Biography

After completing his higher education, he undertakes law studies in Paris where he lives for 5 years, then moves on to Toulouse. Back in his province, he is commissioned to be the king’s councilor at the Angers Court of Justice. Author of many poems – *Erotopegne ou Passe-temps d’amour* (1576) and *Œuvres et m langes po tiques* (1579) – of a comedy *Le Muet insens * (1576) and a singular writing *l’Edom, ou les Colonies idum enes, en l’Asie et en l’Europe* (1620/1623) to prove that the Anjou inhabitants originate from Esau, he is mostly famous for his *Discours des Spectres* (Bayle 1720; Barbier 1829).

Heritage and Rupture with Tradition

Imposing work of around 900 pages – *in quarto*, the *Discours* was published in three different versions: first in 1568, with the title *IV livres des Spectres*; they reappeared in 1605 in a new amplified version; and then in 1608, titled *Discours des Spectres ou vision et apparition d’esprits*. The primary intention of the *Discours* is therefore obviously polemical; it is part of the development of the Reformation debates and embraces the Counter-Reformation. But, beyond the Council of Trent, the belief in the Purgatory and in the apparitions of the souls of the deceased, the practice of exorcism, and the respect of the dead’s cult, find, in Le Loyer’s writings, opportunities in a real encyclopedia of apparitions, based on the old, medieval, contemporary as well as Hebraic, Greek, and Latin texts (Dubois 1991; Toussaint 2001). Most of all, Le Loyer grounds the certainty of his science on a natural order guaranteed by the divine power, against those he calls the Atheists and the “Sadducees,” deniers of the demons’ existence. To this syncretism, he adds a legal doctrine: through the study of the trials for possession and apparitions and with what he deems to be experimental evidence, testimonies of experiences from his own contemporaries. If, for Bodin, these narratives aim at emphasizing the punishments by

which the protagonists of the encounters with these demons were chastised, and their necessity, in Le Loyer's reflection, the attention to the demons represents an element of the devil's expression like the others. His demonology does not exclude the judicial severity that he sometimes invokes against the Atheists, but it is more general and does not intend to wear out a specific enemy. It shows a rather demonological vision of the world.

Innovative and Original Aspects of *Discours des Spectres* and Pierre Le Loyer's Demonology

For the author, the main point is not about indicating the dividing line between natural and supernatural, but understanding the occult links, far from any intention of a "scientific demystification," in order to seize a truth proper to the science of the specters. In the profusion of the content encompassed by the science of the specters, demons and spirits occupy an essential function that deserves to be scientifically studied because they guarantee in negative the coherence of the world. The recovery, valuation, and reinterpretation of a whole heterogeneous tradition accompany his activity as a polemist relentlessly. Faced with the now complicit natural magic of atheism and skeptical Protestantism, Pierre Le Loyer pursues his controversy beyond the political and religious spheres, leaving a work that goes further than the anthologies of the extraordinary and occult events in his time, enabling us to foresee a new approach with regard to the unexplained: the elaboration of a *sui generis* science (Miglietta 2019).

Le Roy, Loys

Born: Coutance 151

Died: Paris 1577

Maria Elena Severini

Istituto Nazionale di Studi sul Rinascimento,
Florence, Italy

Abstract

Translator and classicist at the Collège Royal, jurist, propagandist, and theorist of history, Loys Le Roy (1510–1577), also known as Regius, was an academic whose role at the Parisian court in the second half of the XVI century is still to be clarified. In 1568, in Paris, as a member of Michel de Vascosan's workshop, the humanist published a commented translation of Aristotle's *Politics*, which was due to become, in France, the reference text for the Aristotelian *ars politica* until the end of the eighteenth century. In 1575, the academic from Coutance printed for Pierre l'Huilier's press the treatise titled *De la vicissitude ou variété des choses en l'univers*, one of the most well-known *histoires de la civilisation* of the sixteenth and seventeenth centuries. Through unprecedented use of an analysis of history grounded on facts, the development of the concept of *veritas filia temporis*, the *querelle* focusing on the relationship between ancient and modern times, the myth of the so-called Noble Savage and the Golden Age, and the theory of the natural differences between people, developed in a broader view of people's characteristics as related to the variety of climates, down to the idea of a global Republic of Nations, Le Roy became the herald of a new interpretation of history stemming from his instinctual optimism and faith, which were bound to pave the way for the cultural revolution of the following century.

Biography

Born in Coutances, Normandy, to a poor family of very humble circumstances, the young humanist

studied at the Collège Norman d'Harcourt in Paris, thanks to the support of Bishop Philippe de Cossé, one of the leading figures at the court of Francis I. In 1530, under the guidance of Pierre Danès and Jacques Toussain, he started studying the Latin and Greek classics; in Toulouse, he was taught Law by François Conan and developed an enthusiasm for the subject. In 1540 he returned to Paris, where he had his biography of Budé published by Roigny; this biography was dedicated to the French Chancellor Guillaume Poyet and earned him a well-deserved reputation as a Latinist, allowing him to access the Parisian intellectual and cultural scene of the time. His role in the court also led him to travel throughout Europe: he spent some time in Melun, Rambouillet, Reims, Fontainebleau, and also in Italy, in Turin, as Mr. Errault's secretary. In October 1550, he moved to England, where he was met by Lord William Paget, Edward VI counselor. Le Roy viewed the practice of *affaires* and deep knowledge of people as the essence of science. And it was thanks to his personal experiences – in addition to the knowledge of Machiavelli and Guicciardini's works – that he developed the theory according to which studying politics also required a deep experience of the things of the world: "knowledge and experience together" was his motto, echoing Aristotle. While he carried out his tasks at court, he continued to pursue his aim of translating into French the most important Greek authors such as Xenophon, Isocrates, Plato, Aristotle, and Demosthenes. But Regius was not only interested in the past but also in his own troublesome time, characterized by the drama of the failing monarchy, by a strong, multifaceted contestation against religion, by the furious wars and violent riots that were undermining the solidity of France at the end of the century. In the restless and bloody European scenario of the time, characterized by civil and religious conflicts, an intense political debate spread across the country featuring the strongest of monarchies, following the identification of a new source of balance, the *Politiques's party*, and the definition of new cultural models that would lead to the development of the theory of the modern state: *Des differens troubles advenants entre les hommes*

par la diversité des opinions en la religion; Dessein du Royaume de France, Exhortation aux Français pour vivre en concorde et jouir du bien de la paix (1562) and the unfinished *Traité de la Monarchie* (1570) are the titles of the pamphlets in which Le Roy discusses politics. Regius's professional expectations were all oriented toward the court but were due to be disappointed owing to the aloofness and indifference of the majority of his patrons. The Cardinal of Lorraine, the Duke of Guise, and the Duke and the Duchess of Savoy, Perrenot; the Bishop of Arras, Pietro Strozzi; Marshall of France, Jean de Monluc; Bishop of Valencia, François Olivier and Michel de l'Hôpital; and the Queen herself flattered him with promises that would never be kept. In 1572 he finally received his long-expected reward and was appointed to the office of royal lecturer of Greek at the Collège de France, under circumstances that have not yet been clarified. From then on, he published several books each year: in 1574 he translated from Latin into French the *Oration du seigneur Jean Zamoscie* upon the election of the Duke of Anjou to the throne of Poland; in the same year, he wrote the essay entitled *Excellence du gouvernement royal*; in 1575 he published the 12 books of the *De la vicissitude*; finally, in the last years of his life, he followed the preparation of a new edition of Aristotle's *Politica* and some new translations of the *Timaeus* and the *Republic* by Plato (Becker 1896; Gundersheimer 1962; Sciacca 2007).

Heritage and Rupture with the Tradition

In 1568 Le Roy published a new edition in French of the *Politics* at the printshop of Michel de Vascosan in Paris. With a dedication to the king's brother, this version, provided with ample commentary, was to enjoy considerable popularity and for two centuries remained the standard French translation of Aristotle's work. As well as addressing specific concerns of the court, Le Roy's editorial operation also fulfilled the declared aim of injecting new life into political science. In translation, the work was able to penetrate beyond the academic circles restricted to Latinists. The translation with commentary is prefaced by a

dedicatory letter to Henry Duke of Anjou and a general introduction to the work and the figure of Aristotle. Here, in addition to extolling the different characters of the various peoples as evidence of the variety of human nature, Le Roy also alludes to the relation between natural attitudes and providence, underscoring the importance of virtuous education, namely, the exercise designed to guide natural inclination toward true perfection. In Aristotelian terms, the *habitus* represents the result of the *inclinatio naturalis* and of *consuetudo*. The law applies indiscriminately (*communiter*) to all the components of a State, but since not all are virtuous, it is up to the law to mould the legislative provisions to fit the various natures of men. However, the spheres of ethics and of politics are separate: reiterating the political function of the laws and the distinction between *vir bonus* and *civis bonus*, Le Roy recognizes that ethics and politics each have their own sphere, although they remain disciplines of moral philosophy. In the brief overview that follows the dedication of the 1568 edition, entitled *D'Aristote et ses oeuvres*, the translator emphasizes the fact that Aristotle's work contains numerous examples and arguments conducted with method and elegance. Consequently, in his own commentary, he will faithfully follow the pattern used by the philosopher, alternating and juxtaposing examples and explanations. The commentator thus appears to be among the first to grasp and appreciate the peculiar character of the work, which proceeds by short-circuiting between theory and practice, on the one hand supporting the arguments with particular examples drawn from history and, on the other, giving theoretical dignity to the specific events adopted as demonstrations. As well as describing the method, Le Roy also explains the reasons behind his work, declaring that he has decided to offer Aristotle's work to the reader because he considers it extremely useful for the prince. Therefore, in the courtly circles within which the French scholar operates, the text acquires instructional value in the political education of the duke who is preparing to become a good sovereign (Gaille-Nikodimov 2006). The preface concludes with several observations regarding the variety of human nature which prefigure the concerns of Le Roy's last

work *De la vicissitude ou variété des choses en l'univers*. Here, perfecting the method already experimented with in the commentary on the *Politics*, the scholar puts into practice the procedure of comparing politics and law which was to be theorized and applied by Jean Bodin (1530–1596). Indeed, in the *Politiques d'Aristote*, each book is introduced by an *Argument* which is a sort of introduction to the topics dealt with, broken down into paragraphs, and accompanied by an extensive commentary full of references and comparisons with biblical sources, the works of Aristotle and those of Plato. Le Roy's commentary is not restricted by respect for tradition and subjection to the classics, but engages actively with the text, adding to it ancient and modern examples to clarify the theoretical controversies raised by Aristotle and also introducing extensive comparative descriptions of the customs and institutions of modern peoples, including those of the East and of the New World. In terms of sources, Le Roy consults a vast number of works; this explains the enormous variety of the subjects and nuances of the commentary, as well as his extraordinary capacity for synthesizing and reworking the writers he has read and translated. Compared to the medieval commentators, Regius brings Aristotle's text to life, adding historical examples to the typically scholastic skeleton of structural analysis. The narrative style was reviled by medieval scholars, who preferred a demonstrative, scientific, logical-deductive approach. On the contrary, the humanist Le Roy enhances it through a commentary lavish in notes and references to the most disparate sources. The medieval commentaries attempted to apply a scientific method to the reading of the *Politics*, leveraging the Aristotelian notions with which they were already familiar from the logical, physical, and metaphysical texts. Unlike these, Le Roy's commentary is characterized by a great richness and variety of historical, geographical, and ethnological references, which make up the connective tissue in which the political theories take shape. Particular facts and events acquire meaning and value in the light of the general theory; the general theory in turn is materialized in the individual events. However, what strikes the modern reader most is the recourse to Machiavelli. There are numerous references to the work of the

Florentine secretary, who according to Regius had drawn the fundamental principles of his book on the prince from the *Politics* (Severini 2014). If, on the one hand, Machiavelli clarifies Aristotle, rendering his thought valid for the present, on the other hand, in the theories of the ancient philosopher we can discern the foundations of the modern theory of the prince (Céard 2004; Severini 2011a, b, 2013a, b; De Smet 2013).

The dialogue between past and present returns in his masterpiece, the treaty *De la vicissitude* in which Le Roy integrates a cyclical conception of time with the notion of the evolution of civilization. While admitting a providential design, the treatise on vicissitude does not neglect the significance of the reciprocity of action between man and nature, between responsibility and necessity, and between human reason and destiny, revealing the complex interaction between individual existence and universal history. The first four books are an accurate display of ancient knowledge gathered all over the world: the natural and scientific concepts match the linguistic-literary, military, political, and institutional ones. Several, different layers of knowledge are addressed both from a synchronic point of view (according to which nature and culture are analyzed in their various manifestations such as writing and the organization of *ars militaris*) and a diachronic one, implying the observation of the evolution of such subjects over time and across different populations. Books V–VII present an overview of Greek and Latin classics and civilizations compared to all other ancient populations on the basis of their theoretical and practical cultures with the aim of defining an actual theory of the classic civilization in clear opposition to the barbaric one: the comparative analysis carried out by Le Roy juxtaposes Greek people and Latin people – the western world and the rest of humanity. Books VIII and IX are entirely dedicated to the Arabic-Muslim culture, compared with all other ancient civilizations in an attempt to corroborate the opposition between the Western (Christian and pagan) world and the Muslim one. Finally, books X–XII focus on his contemporary society, analyzed according to three different logics: book X addresses the theme of the present time at

different latitudes, from Europe to Asia and Africa; book XI, instead, describes the relationship between present and past and the chances that a deep crisis and decadence might threaten to dramatically affect historical events; and book XII is a leap into the future, with a thorough description of the path to be followed. For European culture, the message that the erudite Frenchman entrusted to the final chapters of the treatise has a dual significance (Céard 1977; Duport 2010a, b, 2011).

Innovative and Original Aspects

On the one hand, it takes up the legacy of the European thinkers whose theories reveal the encounter between an element of identity, the constant schema of passions and desires that induce men to repeat the same behavior in different contexts and situations, and an element of difference, the *hic et nunc* in which on every occasion each individual finds himself acting in a new and unrepeatable manner. From the reading of Machiavelli and Guicciardini, Le Roy derives both the historian's characteristic attention to the *événementielle* dimension – which attributes dignity to specific cases through the *exempla* – and the general definitions and universal rules inherited from Aristotelian political science (Sciacca 2005). On the other hand, supplying sources and suggestions, Le Roy's vicissitudes converge with the ontological revolution of the new philosophy of Giordano Bruno (1548–1660), which reveals in the tension between time and eternity the manifold facets of a single universal substance, undermining – in the passage from the *unum* to the *varietas* – the opposition between ideal and real, universal and particular, and tradition and innovation (Severini 2017).

Impact and Legacy

In 1585, 10 years after the *princeps*, the Venetian workshop of Aldo Manuzio published an Italian translation of *De la vicissitude*, entitled *La vicissitudine o mutabile varietà delle cose*, made

by Ercole Cato (1538–1606), a scholar from Ferrara who was among the founders of that city's "Accademia degli Intrepidi" and was famous for his translation of Bodin's *Demonomania*. The Italian version of the book was to become quite popular in Italy, as shown by the presence in the national libraries of a relevant number of copies of both its original and translated versions (Severini 2014). The book was also translated into English, by Robert Ashley, in 1594. Le Roy's writings had a huge, overnight success in England and triggered the interest of many authors such as Edmund Spenser, John Norden, Christopher Marlowe, George Hakewill, Gabriel Harvey, and Francis Bacon. Among the first promoters of the modern idea of progress as we intend it, Regius's writings are to be deemed as an important source to better understand the development of some of the most renowned European writers of his time, such as Machiavelli, Guicciardini, Bruno, Montaigne, and Bacon. In addition to the introduction of the comparative analysis to be applied to both politics and law, immediately exploited by his contemporary Bodin, Le Roy's works reflect on some of the most crucial points dealt with in Europe during the sixteenth century.

Lefèvre d'Étaples, Jacques

Born: c. 1460

Died: 1536

Christophe Geudens

Faculty of Arts, Katholieke Universiteit Leuven,
Leuven, Belgium

Abstract

Jacques Lefèvre d'Étaples (Latinized *Jacobus Faber Stapulensis*) was a professor of Arts at the University of Paris and a Biblical scholar active during the late fifteenth to early sixteenth centuries. Heavily influenced by Italian humanists such as Ermolao Barbaro and Pico della Mirandola, Lefèvre became one of the first Northern European proponents of what is nowadays referred to as Renaissance Aristotelianism: he wrote a number of influential textbooks on the various branches of Aristotelian philosophy and significantly contributed to the spread of new translations of the Stagirate's oeuvre through his editorial activities. Lefèvre combined this fondness for Aristotelian philosophy with a keen interest in Neoplatonism and late medieval mysticism, as found in the oeuvre of Nicholas of Cusa, Ramon Lull, or Marsilio Ficino, whose works he also saw to the press. Thus his oeuvre was of paramount importance in introducing the ideas of Neoplatonic mysticism and Renaissance Aristotelianism to Northern Europe, in a period when late scholastic philosophy still dominated the Northern intellectual scene.

Biography

Information on Lefèvre's earliest years is scarce. He studied Arts in Paris, probably during the late 1470s, although the exact dates of his matriculation and graduation are uncertain. In the early 1490s, he acted as a professor of philosophy at the Paris Collège of Cardinal Lemoine, a position he would hold until 1508 (Graf 1842). Here Charles de Bovelles and Josse Clichtove figured among his students. During the two decades in which he was teaching at the Arts, he repeatedly journeyed to Italy (in 1491, 1500, and 1507), where he made the acquaintance of Marsilio Ficino, Ermolao Barbaro, Pico della Mirandola, and Angelo Poliziano, among others. These Italian sojourns exerted a decisive influence on his intellectual profile: he became adept at Neoplatonism and was introduced to the new humanist approach to Aristotle as developed in the philosophical circles in Florence, Venice, and Rome. Having resigned from his professoriate of Arts, Lefèvre's main interest shifted to Biblical studies. A major proponent of Biblical humanism, he published a translation of the Psalms (1509), edited the Pauline epistles (1512), and translated the New Testament into French (1530), but eventually got dragged into multiple controversies concerning the Catholic orthodoxy of his thought (On Lefèvre's theological oeuvre, see Barnaud 1900; Bedouelle 1976, 1979, 2008; Hughes 1984; Pernot 1995; Porrer 2009; Spiess 1930). He died in 1536.

Lefèvre's interest in Aristotelian philosophy, a consequence of his teaching duties, revealed itself most prominently in the numerous translations of, and introductions to, the *corpus Aristotelicum* he authored and edited during the 1490s and 1500s. Inspired by the hermeneutical principles of Ermolao Barbaro and Angelo Poliziano, Lefèvre was convinced that a restoration of Aristotle could only be effected once new, reliable translations of Aristotle's works were available in print and had supplanted the word-for-word renderings of scholasticism. Hence, having returned to France in 1492, he devoted himself to the publication of the stylistically polished translations of the Aristotelian corpus by Italian Quattrocento humanists (e.g., Leonardo Bruni's version of the *Ethica*

Nicomachea, *Politica*, and *Economica*, published in 1497 and 1506, respectively; Argyropoulos's translation of the *Metaphysica* was published in 1515, Giorgio Valla's rendering of the *Magna moralia*, 1497). Parallel to these editions, Lefèvre himself wrote for the benefit of his students a number of highly successful introductions to nearly the entire *corpus Aristotelicum* (Lefèvre 1492, 1494a, 1494c, 1495, 1496; see also Lefèvre 1508). In his own day, his reputation as a philosopher mainly rested upon these basic manuals. Lefèvre was convinced of the value of the study of Aristotle's writings for the intellectual maturing of youngsters, provided that such a study was propaedeutic. Hence, rather than composing commentaries in the form of the then-common scholastic *quaestio disputata*, he consistently epitomized and paraphrased Aristotle's text, thus compiling abridgements of the Aristotelian corpus that present a lucid and general overview of the Stagirite's lines. By so doing Lefèvre avoided quarrelling over the text's most obscure points, a standard aspect of most scholastic commentaries so detested by the humanist movement (Bianchi 2000; Kessler 1999; Lines 2007; Minio-Paluello 1952; Rice 1970; Vasoli 1959).

Lefèvre combined this enthusiasm for Aristotelian philosophy with a keen interest in Neoplatonism and late medieval mysticism. Soon after his first trip to Italy (and possibly as early as 1493), he authored his (still unpublished) *De magia naturali*, a treatise on magic reminiscent of Ficino's *De triplici vita*, and equally indebted to the traditions of Lullism and Cabalism (Kieckhefer 2007; Llinares 1973; Mandosio 2013; Rice 1976; Veenstra 2009; Victor 1975). This fondness for Neoplatonic mysticism becomes further apparent in his editions of Ficino's *Pimander* (1494b), the works of Dionysius the Areopagite (1499b) and Ramon Lull (1499a, 1505, 1516), and the *Opera omnia* of Nicholas of Cusa (1514). Following in the footsteps of, among others, Ficino and Pico, Lefèvre was convinced of the essential harmony of all types of philosophical and religious wisdom. As a consequence, he did not see a discrepancy between Aristotle, Plato, and the Christian faith (Rice 1969; Roulier 1991). Lefèvre considered the

study of Aristotle's writings a necessary step on the road leading toward the contemplation of God. As the Stagirite's teachings "purified the mind" (Lefèvre 1506: ff. 123v–124r), they enabled the intellect to move upward, in an ascent reminiscent of Platonic dialectic, from the cognition of sensible species to the cognition of their intelligible counterpart. Once well-versed in the basic principles of Aristotelian philosophy, one should continue with the study of mystic authors, such as Nicholas of Cusa and Pseudo-Dionysius, in order to be instructed in contemplation (Copenhaver 1977; de Gandillac 1973; Oosterhoff 2014; Pantin 1988; Rice 1971).

As one of the proponents of the first generations of Northern philosophers who were influenced by the humanist movement, Lefèvre was of paramount importance in spreading Renaissance Aristotelianism and Neoplatonic mysticism throughout Northern Europe. Today, however, Lefèvre is far better known as a Biblical scholar than as a philosopher, his philosophical production not yet having received the scholarly attention it deserves.

Lenses in Renaissance Science

Matteo Cosci

Università Ca' Foscari Venezia, Venice, Italy

Abstract

Lenses – curved pieces of glass that can focus light to create magnified images of objects – must be included among those essential and irreplaceable instruments whose use helped to view reality in an unprecedented way. For example, lenticular artifacts such as telescopes, microscopes, and eyeglasses, literally allowed to focus a new image of the world, up to persuade mankind on an optical basis that – as Shakespeare's Hamlet said – “there are more things in heaven and earth, Horatio, than are dreamt of in your philosophy.”

Heritage and Rupture with the Tradition

Lenses had a fundamental role in the progress of scientific knowledge, and particularly in the period of a scientific revolution, their instrumental contribution cannot be underestimated by any means. In fact, such apparently simple devices helped so much for the advancement of visual understanding of the surrounding world, from the macroscopic to the microscopic level, not to mention their innovative support as external prosthesis for reading. Telescopes, microscopes, and proper eyeglasses were among the main Renaissance inventions, and all of these were constituted by aptly worked and assembled lenses, thanks to an unparalleled mix of long-trained craftsmanship, optical research, and practical experimentation in glassmaking, glass-grinding, and glass-polishing.

Pre-Renaissance origins of lens production should be searched in the re-elaborated reception of Greek and Roman optical knowledge as mediated by the Arab culture of the Middle Ages and, from the practical point of view, in the advanced technical know-how developed in some Italian centers of glass production (namely, Florence,

Altare, and, above all, the island of Murano, Venice).

Besides their skilled mastery of optical tools such as reflecting planes, parabolic mirrors, light-dispersing prisms, burning glasses, and even some sort of pinhole *camerae obscurae*, the Arab scholars made use of water-filled glass spheres for obtaining some magnifying effect – some rudimentary zoom that already Seneca and Pliny the Elder mentioned in their writings. Once translated into Latin, Ibn al-Haytham's *Perspectiva (De Aspectibus)* became the standard reference treatise on optics and lenses for all the next developments on the matter. Studying optical geometry and the reflecting properties of light through transparent media, philosophers such as Grosseteste and Bacon predicted the enormous potentialities of optical glass once the suitable technology for actually making it would have been reached.

However, “from their invention in the late thirteenth century until well into the sixteenth century, lenses were mentioned only rarely in the philosophical literature. They remained craft items which did not attract the attention of writers on optics, because these scholars worked within the classical Greek tradition of dealing with refraction through entire spheres. [...] the fact remains that scholars showed little or no interest in lenses until the sixteenth century” (van Helden 1977).

In fact, although transparent stones such as pure quartz or white crystals already available in nature were engraved and used as lenses since Babylonian and Egyptian times, among the earliest simple tools of visual enlargement that should be recorded in early modern Europe, there were just small magnifying glasses (usually capable of about 6× enlargements or slightly more) and were used for inspecting tiny insects such as fleas; hence these early magnifiers were called “flea glasses.” Even before, “reading stones” (hemispherical-cut transparent rocks, like polished quartz) were in use since medieval times in some monks' *scriptoria* as an aid for reading and coping tiny-illuminated manuscripts, until they were replaced by the use of more

practical glass spectacles. The name “lens” itself, meaning any glass apt to regulate light rays, spread and found spoken use in this period – from the Latin word *lens*, “a lentil,” by analogy with the double-convex shape that they mostly had.

The first prototype of glass spectacles was probably “invented” in Pisa around the end of the thirteenth century, and their use spread quickly, benefitting the increasing number of weak eyes, especially after the invention of the printing press. However, as it has been recognized, spectacles “were not really an invention per se but instead a bright idea or ‘adaptation’ of something used earlier – the simple rock-crystal stone magnifier which had evolved into the single hand-held low-power dioptric vision aid. Two similar glass discs came from the ingenious idea of blowing small glass balls and then punching out round pieces using a cool copper pipe. Each glass was first ground on its back surface and then surrounded by a crude frame and given a handle. Technically, glasses were formed when two of these were connected together at the ends of their handles by a rivet, creating the world's first glasses” (Fleishman et al. 2016).

By the end of the fourteenth century, Venice, Florence, and then the Low Countries were the main headquarters of glassmaking and lens-making in Europe. Other centers of production like Germany, France, and the Netherlands were mentioned more frequently in the sources only by the sixteenth century. The first mention of Bohemian eyeglass lens production at local glassworks comes to us from the 1600s, when Bohemian crystal increasingly became famous throughout continental Europe and put also the Italian articles, previously reckoned to be the best one, into the shade. However, around the middle of the fifteenth century, Florence was the leading manufacturer of good-quality spectacles for eyesight, producing in large quantities not only convex lenses for presbyopes but also innovative concave lenses for myopes (Ilardi 1993, 2007). Such profitable leadership in the field of glassmaking had to be soon shared and then entirely left to the Republic of Venice's monopoly, where, in addition to any sort of refined glassware,

“roidi da ogli” or “vetri da occhi” (literally, “disks for the eyes”) were produced and commercialized as well.

As much as techniques of glass production evolved, treatises on the subject were increasingly published: important works as the anonymous *Ricettario Darduin* (beginning of the seventeenth century), Antonio Neri’s *Ars Vitraria experimentalis* (1612), and Carlo Antonio Manzini’s *L’occhiale all’occhio, dioptrica pratica* (1660) contributed to spreading the Venetian proficiency in the field. At that time Venice was one of the most advanced centers of the glass industry; its crystal glass was so famous, precious, and desired that imitations “a la Façon de Venise” started to be attempted all over Europe.

It was in this context that Galileo heard of the invention of a Dutch spyglass, something that he reproduced in his workshop and even improved. Grinding his own lenses, testing different optical arrays, and finally aligning an objective-convex lens with a concave eyepiece, he managed to create what turned out to be a magnifying instrument capable of 3×, 8×, and, a bit later, 30× enlargements: as soon as pointed toward the heavens, Galileo’s “cannocchiale” famously changed the history of astronomy.

In parallel, during the 1590s, Hans Lippershey, or more probably Hans and Zacharias Jansen – two Dutch spectacle-makers – managed to build the first prototype of a handheld microscope, aligning a biconvex ocular lens with a plano-convex objective lens in a draw tube. In 1609 also Galileo Galilei developed a compound microscopical “occhialino” with a convex and a concave lens, along the lines of his telescope, and, by 1624, he had arranged one model with three biconvex lenses, capable of 30× magnification. Such a skilled use of optical lenses opened the doors of the microworld, and the previously unseen results of that show were not late to come.

Before groundbreaking studies in this field as Robert Hooke’s *Micrographia* (1665) and Anton van Leeuwenhoek’s microscopical observations, it should be mentioned the work of the naturalist Giambattista Odierna, who gave the first detailed account of the interior construction of living tissue

(a fly’s eye) based on the use of a microscope in his *L’occhio della mosca* (1644) and, later, from the 1660s, the work of the physician Marcelo Malpighi, who began the microscopic analysis of biological structures, and who that de facto inaugurated the field of microscopical histology.

It is not exaggerated to state that without such a learned and wise mastery of glassmaking and intelligent use of optical glass in particular, “it is difficult to see how that vast revolution which we call the Renaissance could have occurred” (MacFarlane-Martin 2002: 76).

León, Fray Luis de

Born: 1527/1528, Belmonte (Cuenca)

Died: August 23, 1591, Madrigal de las Altas Torres (Ávila)

Albert Lloret

University of Massachusetts Amherst, Amherst, MA, USA

Abstract

The Spanish Augustinian friar Fray Luis de León was a professor of biblical and theological studies at the University of Salamanca. He authored theological treatises, scriptural commentaries and translations, as well as a noteworthy corpus of classicizing lyric poetry in Castilian vernacular. Due to his interpretation of the Scriptures, he suffered imprisonment and trial by the Inquisition.

Biography

Fray Luis de León enters the Augustinian convent in Salamanca probably in 1543. He makes a profession in the order in 1544. Between 1544 and 1546, he studies Arts in the convent and, with professors Melchor Cano and Domingo de Soto, theology at the University of Salamanca, off and on between 1546 and 1560. In 1551, he begins teaching in one of the convents of the order. He spends at least the 1556–1557 academic year studying theology at the University of Alcalá, where he meets the Cistercian professor of biblical studies Cipriano de la Huerca. Scholasticism was strong in the University of Salamanca, whereas the theology taught in Alcalá was rather founded on biblical studies. Fray Luis's acquaintance with de la Huerca in Alcalá would be a crucial formative experience for him, as well as for several other fellow students close to the Augustinian friar, including Hebraists Benito Arias Montano and one of his colleagues later in the University Salamanca, Martín Martínez Cantalapiedra. De la Huerca was a disciple of

Dionisio Vázquez, an Erasmian professor of biblical studies at Alcalá. De la Huerca's university lectures explained the literal sense of the Scripture on the basis of not the Vulgate but the Hebrew and Greek texts. In his rhetorically amplified commentaries, he used classical authors as sources of authority, as well as – though to a lesser extent – the work of rabbis, cabalists, and the *Corpus Hermeticum*. Seeking to balance allegory and literality, his allegorical interpretations often resorted to the Greek fathers. Fray Luis's biblical commentaries, like Arias Montano's scriptural scholarship, continue these scholarly practices, as becomes evident from the authors' knowledge of Hebrew and their use of the rabbinic tradition of biblical exegesis.

By 1558 Fray Luis has graduated with a bachelor's degree from the University of Toledo. In 1560, he consecutively obtains the degrees of licentiate and master in theology from the University of Salamanca, where he begins teaching that same year. In Salamanca, he would develop his entire academic career. During his tenure, Fray Luis holds the chair of Saint Thomas (1562–1565), the chair of Durandus (1565–1572), a special chair of theological studies (1577–1578), the chair of moral philosophy (1578–1579), and, eventually, the Bible chair, which he occupies until his death (1579–1591). The only serious interruption in his university duties, before the last 2 years of his life, occurred between March 1572 and December 1576, when he was imprisoned and tried by the Inquisition.

In 1561 Fray Luis translates but does not publish, the *Song of songs*. The text, nonetheless, would circulate handwritten. His Castilian rendition is accompanied by a commentary on the literal meaning of the text. His gloss delves into the passions of human love and only occasionally tackles the spiritual sense of the Scripture. To clarify the literal sense of the text, Fray Luis uses secular writings on love, from Petrarchist to Neoplatonic works. In line with Arias Montano's and de la Huerca's interpretations of the book, Fray Luis claims that it belongs to the pastoral genre. For his gloss, he also draws from rabbinic commentaries and Sephardic vernacular translations

of the Scriptures, on which his own rendition is actually based. In 1580, he publishes a reworked Latin version of his commentary, to which he adds an allegorical interpretation. This new gloss is centered on the moral progress of the human soul searching for the love of God. In 1589, he further expands his commentary with another allegorical, now ecclesiological, explanation of the text.

In December 1569, Fray Luis is appointed to a committee of theologians created to examine the hermeneutical notes of the Vatable Bible, which was to be printed by Gaspar de Portonariis. The committee is chaired by Francisco Sancho and includes Fray Luis's colleagues at the university, León de Castro, Martín Martínez de Cantalapiedra, and Gaspar de Grajal. In January 1571, the committee completes the task. In March of 1572, de Grajal, Martínez, and Fray Luis are arrested, imprisoned in Valladolid, and subsequently tried by the Inquisition. The main accusers in the Inquisitorial processes are León de Castro and Bartolomé Medina, both faculty members at Salamanca. The imprisonment of Fray Luis and his colleagues only to a certain extent follows from the discussions that occurred during the review of the Vatable Bible. The three independent Inquisitorial processes belonged to an ongoing struggle, on the part of the Inquisition, the Dominican order, and some professors at the University of Salamanca, to counter a trend of theological studies that sought to philologically examine the Bible in view of its Greek and Hebrew sources and traditions of scholarship. The charges against de Grajal, Martínez, and Fray Luis, in essence, concern four questions: (1) considering the *Song of songs* love poetry, not unlike Ovid's *Amores*, and explaining it in Castilian; (2) considering that the text of the Vulgate can be corrected and improved; (3) considering that Jewish interpretations of the Bible are preferable to those of theologians and the Church Fathers, since the literal sense of the text takes precedence over the allegorical; and (4) considering that many biblical texts can be understood, not against but, regardless of their traditional interpretation deriving from the teachings of the Church Fathers. The beginning of the process against Fray

Luis owes more to his friendship and common intellectual views with Grajal and Martínez, who have already been enduring Inquisitorial harassment, than to his own writings. The Jewish ancestry of all three scholars is taken as an additional cause for suspicion. Fray Luis's translation and commentary of the *Song of songs*, in fact, contravenes the Spanish Inquisition's strict interpretation of the less clear Trentine decrees regarding the translation and commentary of the Scriptures in the vernacular. Fray Luis's insistence on the multiple senses of the Scripture harms him as well. He spends almost 4 years in jail, where he writes a number of texts for his defense and perhaps some of the works he would later publish. In November 1576, the Valladolid tribunal declares him guilty, but the supreme council in Madrid does not ratify the verdict. On December 1576, Fray Luis is absolved. He receives a recommendation to be moderate and prudent regarding the issues dealt with in the trial and his vernacular translation of the *Song of songs* is seized. He then triumphantly returns to Salamanca. On June 1577, Martínez is set free. De Grajal died in prison in 1575 and would not be acquitted of all charges until 1578. Fray Luis would be denounced again to the Inquisition in 1582, this time regarding his opinions on predestination, but he would not go to jail. He is acquitted of all charges in 1584.

In December 1577, the provincial superior of the Augustinians in Spain, Pedro Suárez, requests that Fray Luis begin publishing his works. The first book Fray Luis sees printed contains his Latin commentaries on the *Song of songs* and on Psalm 26 (1580). He also publishes commentaries on the Book of Obadiah (1589), Paul's epistle to the Galatians (1589), fragmentary glosses on a few Psalms, and, posthumously, a full commentary on Psalm 51 (1607). Most of his theological treatises and exegetical works deriving from his university lectures were not printed until the edition of his *Opera* (1891–95). In the Castilian language, in addition to editing the works of Theresa of Ávila (1588), he publishes two prose works that are considered a model of Renaissance eloquence: a guide for married women and moral commentary on the last chapter of the Book of Proverbs (*La*

perfecta casada, 1583b) and *De los nombres de Cristo* (1583a), a dialogue on the interpretation of the names of Christ in the Scripture. His commentary on the Book of Job (*Exposición del Libro de Job*), which he completed only in 1591, was not printed until 1779. In his exegetical works, Fray Luis glosses the text by drawing on a wide variety of sources, from classical authors and the Church Fathers to contemporary theologians and humanists, from Stoic and Neoplatonic authorities to cabalistic writings. In his interpretations, he moves from comparing translations and examining the original words of scriptural passages to establishing the literal meaning of the text and then tackling its allegorical and anagogical senses while bringing up a varying range of sources at his command. His emphasis on the literal clarification of the texts is perhaps the most notable feature of his eclectic, Humanistic exegesis.

Not only does Fray Luis devote his education in *litterae humaniores* to biblical commentary. His corpus of vernacular poetry and verse translations is, in fact, his best-known and most thoroughly researched literary legacy. Fray Luis is the first humanistic poet in Castilian vernacular or, as has been alternatively formulated, the first Neolatin poet in Castilian. He follows the themes and own imitative techniques of his Greek and Latin sources, seeking to adapt even the original metrical forms into the vernacular. Fray Luis never saw his poetry printed. It circulated profusely in manuscripts until, and well beyond, Francisco de Quevedo's edition of 1631. With the only notable exception of Garcilaso de la Vega's works, he sets aside the Castilian literary tradition and labors on references from classical authors, also in his religious poetry, and particularly from the works of Virgil and Horace, whom he too translates. His poetry, thus, shows the influence of Tibullus, Propertius, Cicero, Seneca, and Boethius, while he translates into Castilian poems by Horace, Virgil, Tibullus, Pindar, Euripides, and Seneca. The psalms, some of which he paraphrased in the vernacular, left a mark in his vernacular poetry. He translates some too, as well as a chapter of the Book of Proverbs and, in terza rima, the entire Book of Job.

Leonardo da Vinci

Born: Vinci, 15 April 1452

Died: Amboise, 2 May 1519

Andrea Bernardoni

Institute and Museum of the History of Science,
Museo Galileo, Florence, Italy

Biography

After spending his childhood in the village of Vinci where, under the guidance of his

grandfather Antonio and his uncle Francesco, he had received primary education, in the early 1460s, Leonardo moved with his father to Florence to enter into an apprenticeship at Andrea del Verrocchio's (1435–1488) workshop. It was here that Leonardo had his first lessons in drawing and painting as well as in the minor arts: carpentry, chemistry, metallurgy, carpentry, and modeling; that is, those practices which constituted the substratum of technical knowledge essential for every artist. The beginning of the 1470s saw his first pictorial activity and his oldest manuscripts date back to that time from which his technical-scientific interests already clearly emerge. Very important, for this period, are the optical studies related both to graphic representation and to naturalistic phenomena such as the propagation of light and the transmission of heat with concave mirrors but also the attempts to apply the Aristotelian theory of the four elements in Metallurgy and in Mechanical Engineering with the design of ovens, cranes, and automata. In 1482, Leonardo left Florence for Milan where he started working as a painter at the court of Ludovico Sforza called il Moro (1452–1508). While trying to stand out as an engineer, his profession remained in this period mainly that of an artist – he dedicated himself to painting (Virgin of the Rocks, Musician, Madonna Litta, Lady with an Ermine, Belle Ferronnière, the Last Supper, Lucrezia Crivelli portrait). He worked on the equestrian monument to Francesco Sforza (1401–1466), which was the most daring technology ever commissioned; an unprecedented challenge because it consisted of realizing with a single casting the pouring of a 7.20-m high horse with over 60 tons of bronze. Leonardo did not manage to cast the monument but the works and research in the metallurgical field which lasted about 10 years led him to contemplate new and futuristic technological problems.

Leonardo's writings during this period showed his propensity to acquire technological solutions and to invent mechanical devices of his own conception to improve efficiency. The Milanese period constituted the most important training and professional development phase of Leonardo's career. While studying the techniques for the Sforza monument cast, he also followed

the expansion and conservation of urban and suburban canals, even if there are no testimonies of his actual involvement in the works. Very interesting are the studies on the automation of operating machines that attempt to develop serial and automatic thought processes. The studies which particularly stand out are the use of the mill as an engine and those for metal carpentry designed by Leonardo in order to integrate up to six work stations with a single feeding system. The most innovative technological studies both for the futuristic solutions adopted and for the completeness of the projects are, however, those dedicated to textile machines. A series of detailed tables and sketches propose the use of machines in order to automate all the processing phases, from spinning to weaving including carding and topping in the case of wool.

While Leonardo carried out these studies he also began a personal research in Natural Philosophy and Physics. He deepened the study of the four elements (earth, water, air, and fire), both in their naturalistic aspects and in their engineering applications. For Leonardo, the elements were the materialization of the fundamental powers of physics on which all natural and artificial phenomena depend. Leonardo undertook these studies, thanks also to his relationships with some Milanese scholars including Fazio Cardano (1444–1524), Girolamo and Piero Andrea who are sons of Giovanni Marliani (1420–1483), Marco Antonio della Torre (1481–1511), and, in particular, from the mid-1490s with the Tuscan mathematician Luca Pacioli (1445–1517). Together with the latter, Leonardo delved into the study of the *treatise of Elements* by Euclid (sec. III a. C.) and the texts of the medieval tradition of Statics (*De ponderibus*) attributable to Giordano Nemorarius's (d. 1237) writings.

The result of this theoretical study was the innovative proposal of renovation of the principles of medieval physics because it was not applicable for practical purposes. In light of these reflections, he, therefore, designed a treatise dedicated to mechanics in order to combine the empirical dimension of machines and the geometric dimension of Kinematics. At the end of the 1490s, Leonardo had acquired considerable

autonomy in engineering, physics, and philosophy of nature, and he continued to study and experiment by following autonomous paths.

With the French occupation of Milan in 1499, Leonardo decided to leave the city after a short stay in Venice and Friuli where he was consulted for a military engineering project to face the advance of the Turkish army. During this period, Leonardo's life took a singular turn when he took into consideration the possibility of moving to Istanbul to the court of the Sultan Bejazid the Second (1481–1512) who was looking for engineers to realize an important urban project in his state. There is a letter written by Leonardo to the Sultan and some projects dating back to this period related to the realization of some devices such as a windmill, a floating bridge, a pump, and, above all, a bridge for the Bosphorus (Ms. L, f. 66r). This leads us to think that Leonardo had seriously considered this possibility. However, he did not go and in the summer of 1502 Leonardo was already in the service of Cesare Borgia (1476–1512), for whom he mainly dealt with urban and territorial reorganization as well as military strategy. During this period, Leonardo realized several maps relating to the territories of central Italy for the armies of Borgia and the Florentine republic. Very interesting are the studies on the Arno valley and Tuscany, realized as a support for the project to build an artificial channel that should have connected the city of Florence with the Tyrrhenian sea. After this brief and intense experience as a military engineer, Leonardo lived in Florence and Milan. In the Tuscan city, he had the opportunity to deepen the feasibility studies of the Arno canalization project and was involved in the war against Pisa precisely to study a way to divert the river upstream of the city with the intent of depriving it of water and thus inducing its capitulation. During this period, between 1504 and 1508, he returned to the study of Hydrology and Geology starting to write a treatise dedicated to these themes whose preliminary version can be seen in the Codex Leicester, in which Leonardo began to gather his observations on these themes; physics of water and engineering are the most technologically relevant topics in all of Leonardo's studies, those to which he was to devote more attention. Also in Milan, where he also dealt

with architectural issues for the regent of the French monarchy Charles d'Amboise (1473–1511), he soon returned to hydraulic engineering, looking for a solution to divert the course of the Adda river to make it navigable and thus put in communication Milan with the lake of Como. Marshal Giangiacomo Trivulzio (1441–1518) commissioned an equestrian monument that Leonardo intended to create with the same casting technique developed for the Monument to Francesco Sforza, but also in this case the project was not completed.

In 1513 following Giuliano dei Medici (1479–1516), he moved to Rome where he had the opportunity to be involved with some engineering projects that concerned the interests of the Medici family, the most important being the project for the drainage of the Pontine plains and the urban reorganization of the harbor of Civitavecchia. Of particular interest for this period were the studies on burning mirrors, a highly sought-after technology at the time because it allowed the power of the sun's rays to be controlled, by converting them into the element of fire. Leonardo elaborated several studies on the geometry of the "ignia," the parabolic curve that determined the focus of the mirror, the metallurgical process, and the carpentry techniques necessary to build it.

Finally, in 1517 Leonardo moved to France, in the service of Francesco I di Valois (1494–1547), who hosted him in the Clou Luce castle in Amboise where, although he was involved in engineering projects for the city of Romorantin, the king left him all the time he needed to cultivate his research and organize his writing. After his death on May 2, 1519, all his manuscripts were inherited by the disciple Francesco Melzi (1491 or 1493–1570), who selected and transcribed the notes dedicated to drawing and painting to assemble the painting book, a version of which would be published in Paris in 1561.

Heritage and Rupture with the Tradition, Innovative and Original Aspects, Impact, and Legacy

Evaluating the originality of the contribution and impact of Leonardo's studies on scientific

engineering culture is not easy. With regards to painting and drawing, important historical evidence has remained and its influence on the history of art can be assessed; however, in the case of engineering and science, it is different because there is no material evidence and documentation of his involvement in architectural and engineering projects that go beyond recording payments for consultancy. However, if Leonardo's professional profile in addition to that of a painter remains rather nuanced, the fact remains that he is the only one of the Renaissance artist-engineers to have left us a legacy of manuscripts that exceeds 6000 sheets, most of which are dedicated to engineering projects and scientific studies. This is a clear evidence of his full involvement in the engineers' sociocultural contest and in the civil and military projects of the courts and city judiciary of the time. The manuscript corpus consists of a series of 21 notebooks and various loose sheets kept in several Libraries and institutions in Europe and the United States, and 3 conspicuous miscellaneous collections, two of which (*Codex Atlanticus* and *Windsor Manuscript*) were created posthumously by the sculptor Pompeo Leoni (1533–1608) who dismembered and cut out many of Leonardo's notebooks to form large thematically organized albums and the last one (*Codex Arundel*) assembled by Leonardo himself. The main difficulty in fully evaluating the contents of these manuscripts in addition to the paleographic aspects follows mainly from the fact that they are mostly notes written for personal use and not designed for disclosure, but which, however, once reordered and recomposed, allow you to follow the evolution of his thought, his projects, and his interests, throughout all his career.

The notebooks of the fifteenth-century engineers are a very rare source, and in many cases, they are not as explanatory and clear as their artifacts are, from which today we try to reconstruct the techniques used in their realization. The value of Leonardo's manuscripts lies in having transmitted to us, in addition to his projects and ideas, also unknown important information about the technology of his time through detailed drawings and verbal descriptions. The studies on

flying machines as well as those on textile machines, for instance, are original research that reflects Leonardo's highest level in technological research and mechanical design. However, for the history of technology, his studies on artillery are no less important. Alongside imaginative elaborations of strong and suggestive graphic impact, he presents a precise recording of the phases of the technique for their production that he had observed in the foundries and which today seems to be the oldest source in our possession on this type of processing. At the same time, fascinated by the new war technology that seemed capable of controlling the power of the element of fire, he carried out external and internal ballistics experiments to try to understand its functioning and potential, in addition to the attempt to give a plausible explanation on the physical plane of the phenomenon the explosion and the generation of the driving force. For these reasons, Leonardo's manuscripts, if considered from a historical perspective and not detached from their context, constitute an important source for medieval and Renaissance technology, a window on many techniques that we would otherwise only know in a deductive way starting from archaeological finds.

If for historians Leonardo's manuscripts could be considered a kind of not an organized encyclopedia of Renaissance techniques and sciences in which to find references and descriptions of processes, structures, and materials, it is more difficult to evaluate their effective impact on Leonardo's contemporaries. After his death, in fact, these did not have immediate circulation and it is difficult to say to what extent they were known. However, in the seventeenth century, starting from the manuscripts kept in the Ambrosiana Library in Milan, a collection of hydraulic studies was compiled by the Dominican Luigi Maria Arconati (born 1605?) and circulated in Rome in the second half of the century; while in 1767 two partial copies of the *Codex Leicester*, which retrieved Leonardo's observations and reflections in particular on geology and hydrology, were also made in Florence. The rediscovery of Leonardo's engineering, however, would take place in the late nineteenth century, when, after

the first publications of the facsimiles of his notebooks, his designs of wings and flying machines were found to be the subject of debate among the pioneers of flight experiments. Later, starting in the 1930s, in particular after Leonardo's first exhibition dedicated to engineering, which took place in Milan in 1939, his machines and mechanical writings became the subject of study by historians, engineers, and scientists.

In the corpus of his manuscripts a place of significant importance, which marks a turning point with tradition are the studies of anatomy which starting from an artistic approach aimed at representing the body transformed into a pathognomic, physiognomic, and physiological research area through which Leonardo tried to understand the structure and functioning of the human body, including the generation of emotions; the so-called movements of the soul. By means of representation techniques, drawing became for Leonardo an investigative tool developed in the study of machines and then applied, using the same graphic expedients, to the analysis of the human body. The novelty of Leonardo's studies on anatomy concerns both the artistic representation and, primarily, the scientific representation of the body; his drawings are characterized precisely by being the result of this coexistence of art and science. Furthermore, Leonardo conceives embryology and physiognomy as two chapters of anatomical research. The human body is a structure that changes form over time by carrying out a somatic forming action first induced by the maternal soul and which continues even after birth, shaping the shape of the body until old age. The most innovative aspect of this research is the invention of an iconographic code for physiognomy, previously completely absent. Leonardo's manuscript became a sort of virtual laboratory for his graphical investigation of both natural and artificial processes. The physical principles that regulate the functioning of machines are the same that regulate the functioning of the human body and natural phenomena. Leonardo guided by the analogy between natural and artificial phenomena engaged in the analysis of the human body to explore and graphically reconstruct its anatomical complexity, up to the point

of designing mechanical prostheses of parts of the human body such as the arms and legs conceiving anthropomorphic and zoomorphic automata that reproduced the movements of natural bodies.

Leonardo's final goal was to become an author of treatises dealing with epistemology and technoscience. He elaborated several drafting and detailed indices of the topics to be treated the most ambitious of which was certainly that one for the mechanics' reform. After moving to Milan, in the late 1480s, Leonardo began to deepen his knowledge of geometry and physics using drawing as a heuristic tool through which to explore the anatomy of machines; he visually defined motion transmission and transformation engineering problems and virtually explored solutions that sometimes went beyond the technical capabilities of his time.

During the second half of the 1490s, under the guidance of Luca Pacioli, Leonardo studied mechanics and in his manuscripts (Codes H and M, Forster I and II, and in many sheets of the Arundel and Atlanticus Codex), there are explicit references to propositions and theorems contained in the treatise on the elements of statics by Giordano Nemorarius (*De ponderibus*), in the mechanics of Archimedes (287–212 B.C.) (*Balance of the planes*), in the *Elements of Geometry* by Euclid, and in the pseudo-Aristotelian tradition of simple machines.

The studies of dynamics are extremely interesting also, but difficult to evaluate. In his notes, Leonardo developed and presented the limits of the traditional notions of force, speed, acceleration, gravity, as well as that of movement, still classified as natural and violent. The concept of motion is particularly important because he comes to propose multiple definitions through which, although he is unable to elaborate a unitary and synthetic theory, he takes into consideration the studies elaborated in ancient and medieval Scholastic traditions. Through the work of Albert of Saxony, Leonardo learns the concept of *impetus*, introduced and developed in the school of Johan Buridan, and with it, he tries to explain the velocity and acceleration of falling bodies. Leonardo shows that he knows the quantitative analysis of

the physical categories developed by the Oxoniense philosophical school, the so-called *Calculatores*, by borrowing and trying to apply their terminology as “degree of speed” and “uniformly unformed motion” (*moto uniformemente disforme*) in his studies, including engineering, as well as their geometric representation by means of the triangle which made it possible to quantify intensity and extent of physical quantities with a scheme. His studies which he carried out with experimentation on machines also led him to become aware of the limits of traditional mechanics which did not apply to engineering purposes because the former did not take into account the materiality of the moving organs. Any mechanical device was subject to being worn down by passive forces such as friction and it was precisely by trying to determine a compensation coefficient of this force that he would develop his proposal to renew mechanics. The result of this research was the design of the *Treatise on the mechanical elements*, to which Leonardo refers several times in his manuscripts and of which we find the most complete version in the manuscript 8937 preserved today in the National Library of Spain. Medieval Physics was characterized by a predominantly geometric-mathematical approach that did not address in any way the problems that arose from the actual construction and then from the actual functioning of the machines, such as, for example, the action of the friction force that deformed the mobile axle of couplings to the point of compromising its functioning. For Leonardo, Mechanics was primarily an experimental discipline, a “sensitive science,” as he later affirmed in the late *Manuscript E* (f. 54r); for example, it had to take into account the different technical characteristics of the materials used in the construction of the machines. Leonardo’s method is based on the physical or image reconstruction of natural processes; for this reason, the study of the powers of nature in terms of mechanical elements had to be placed before the study of the human body and more generally to all philosophy of nature. The possibility of representing and building mechanical devices and exploring their various application possibilities through the strictness of geometry constituted a fundamental

step in Leonardo’s studies because these techniques became the main tool for the study of both the macrocosm (nature) and the microcosm (man). Machines and technological processes in fact provided models to understand and reproduce natural phenomena, and it is precisely in this analogy between technological and natural processes that, during the 1490s, Leonardo would define the products of technology as if they were a “second nature.” For Leonardo, these were objects built in imitation of the natural ones but which remained distinct from them even if they were subordinate to them: the mechanical arts were not in fact able to reproduce natural objects, but only to create their simulacra. The powers of gravity, force, motion, and percussion, which for Leonardo were the four fundamental principles of physics on whose action all natural phenomena depended, were also entities that could be generated and controlled artificially by means of the mechanical arts. If in nature, therefore, the substrate through which these powers manifest themselves was made up of the four Aristotelian elements of earth, water, air, and fire and their compounds, in the world of artificiality these same powers were materialized through the “machine elements” which constituted the basic components for the construction of the machines and the implementation of the operational processes. The categories of forces acting in the world of natural elements were therefore the same as those acting in the artificial world. Placed in this process of rethinking physics and natural philosophy in mechanistic terms, the study of machines provided the patterns and models for interpreting, understanding, and controlling the structures and processes of transformation of nature, while offering tools to try to reproduce them artificially.

One of the most profitable engineering fields on the techno-scientific level determined by Leonardo’s epistemology is certainly what we would now call aeronautical engineering in which crossed researches of engineering, physics, and anatomy intersected. Leonardo approached the theme of flying machines by following wing movement issues in the context of theatrical scenography. Over the years, the reciprocating

motion mechanism for the wings flapping became a reason for an in-depth anatomical study in an attempt to reproduce the natural kinematics of the wings through the use of mechanical elements (cranks and pedals) operated by the pilot. Leonardo moved on to two lines of research. On the one hand, the spacecraft, that is, the propulsion system that tried to optimize the energy produced by the muscles of the human body used as a motor, and, on the other hand, the study of the wings, a real biomorphism research which took into consideration the morphology of various insects, the bat, and large birds of prey. Leonardo's studies on flight are traditionally divided into two parts: those focused on mechanical wing-flapping developed during the 1490s and those on gliding, which Leonardo would have taken into consideration after having reported the impossibility of engineering the first solution, especially starting from the sixteenth century. Flight studies led Leonardo to question the material nature of the air and experiment with its compressibility and resistance to motion, while observing the flight of birds and their anatomical dissection led him to design articulated wings that sought to replicate natural ones. In these comparative studies of natural philosophy, anatomy, and engineering, Leonardo came to conceive the idea that in the air considered a material body comparable to the fluid body of water it was possible to move by exploiting the spiraling movements of vortices, thus conceiving the idea of a propeller machine able to screw into the air (*Il manoscritto B*, f. 83v). The braking impact of the air, however, which was experienced with sails, led him to also develop the idea of the parachute, already presented by other engineers of the time, proposing a large umbrella device (*Codice Atlantico* 1058v).

The experimentation on the elements conducted between the late 1490s and the beginning of the following century led Leonardo to question himself on their nature and to return critically to the concept of an element which in the traditional vision was defined on the basis of the qualitative principles of heat, cold, dry, and wet but without any quantitative correspondence with the actual material transformation phenomena. In the technical processes, in

fact, the elements showed a nature of a corpuscular type, which the Aristotelian speculative explanation did not consider. Leonardo's reflections and experiments on the theory of matter represent one of the highest moments of his research and speculation in natural philosophy which culminated in an attempt to define an alternative element to that of the Aristotelian tradition. In fact, Leonardo tried to give a characterization of the elements on the basis of quantitative parameters such as density, shape, and elasticity, overcoming the qualitative vision of the elements typical of the Aristotelian tradition which did not allow a quantitative explanation in terms of parts of the compounds and chemical mixtures. On a speculative level, Leonardo went beyond the problems related to the experimental adherence to the structure of matter by developing a metaphysics that found expression in the concept of form as a synthesis between geometric space and physical dimension.

Leonardo's reflections start from the concept of geometric space, the space of the painter, as it was defined by Euclid in his *Elements* and also in the treatises of Renaissance artists such as Piero della Francesca (1416–1492) and Leon Battista (1404–1472) Alberti: the point generates the line, the line generates the plane and the plane generates the space. Starting from these principles it is possible to reproduce the shapes that define reality in the geometric space. Leonardo shifts his reflection to the philosophical level and questions the relationship that point, line, and geometric shapes have with physical reality. His notes remain fragmented and incomplete, but it is interesting that, in addition to the mathematical-geometric point, he also took into account the moment, that is, the time point and the atom, namely, the material point, thus bringing the generation of spatial dimensions back to the point, thunderstorms and materials. These reflections constitute the most abstract speculations that Leonardo attained and are symptomatic of the peculiarity of his thought. That is, how geometric categories designed for graphic representation become philosophical instances presupposed for a quantitative interpretation of phenomenal reality. It is in this dimension straddling geometry and physics that Leonardo placed the category of the powers of nature, those forces that have no body but have

energy and act on the physical plane. This dimension which Leonardo significantly calls being of nothingness (*essere del nulla*), due to its liminal condition between the material plane and the ideal plane, was a common causal instance for all the chemical and physical transformations of nature and technology. An important example of how these powers act in the world of the elements is that of the ignition of the flame with the burning mirrors; these convey the percussive energy of the sun's rays to a single point where this power translates into heat and therefore into fire, triggering a process of material transformation that leads to the consumption of physical bodies.

Leonardo believes nature was constantly changing due to the "chemical-physical" action induced in mixed bodies and elements by the natural powers. By investigating the structure of matter and its changes, he arrived to make interesting observations and develop concepts and theories which, in this case too, stand out for their modernity. The studies of hydrology and geology informed by traditional texts, such as the vulgarization of Aristotelian *Meteorology* and the medieval comments of Aristotle's *De Coelo et Mundo*, in particular those of Albertus Magnus and Albert of Saxony, but also extracts of Aristotle's natural philosophy in the vernacular, such as *Il libro della composizione del mondo* (The book of the composition of the World) by Ristoro d'Arezzo and calls Giovanni Sacrobosco's *Sphaera*, Claudius Ptolemy's *Geography* together with the observations made on the many voyages through Northern and Central Italy, lead him to imagine the Earth as a dynamic system that changes state, thanks to the constant imbalance between the elements that generate changes in the mineral and vegetable kingdom. In the *Codex Leicester*, written at a mature age, a mechanistic view of the Earth and the Universe, Leonardo makes hydrogeological reflections also for the Moon; it clearly emerges among more than 900 hydrology assertions that make up this notebook. For every depression in the earth's crust, Leonardo always corresponds to an opposite protrusion which allows the earth's water system to remain in balance. With each change induced by erosions, rearrangements are caused in which the masses

tend to balance themselves again around the center of the world. Observing the surface fractures of the earth's crust, Leonardo proposes a theory of change similar to the modern plate tectonics explanation and he also realizes that the age of our planet must have been moved much further back than the approximately 6000 years imposed by biblical chronology. Moreover, observing the orography and the distribution of fossils especially in the Arno valley of the interior of Tuscany and in the Po valley, Leonardo concludes that the earth had undergone strong changes over the centuries and sees in this reason the explanation of why shell fossils are found even hundreds of kilometers from the sea in hilly areas.

Leonardo did not manage to develop his natural philosophy in a systematic way. However, his thoughts are testimony of the degree of cultural autonomy he had reached, the highest expression on the level of theoretical elaboration in the context of the mechanical arts in which he autonomously worked with the processes of transformation of substances; and dialoguing with theories traditional questions were asked and answers given which intended to bring about a radical renewal in science and engineering.

Leone, Ambrogio

Born: Nola, 1458/59

Died: Nola, 6 March 1525

Leen Spruit

Faculty of Arts and Center for the History of Philosophy and Science, Radboud University Nijmegen, Nijmegen, The Netherlands

Abstract

Ambrogio Leone (1458/1459–1525), Italian humanist and physician, friend to Erasmus of Rotterdam, studied in Padua where he graduated in philosophy and medicine, and then returned to Nola; his most important works are a historical treatise about his place of birth (*De Nola*, 1514) and a polemical work against Averroes (*Castigationes in Averroem*, first edition 1517).

Biography

Ambrogio Leone (Nola, 1458/1459–Nola, 6 March 1525), son of Marino and Marchisella Balletta, was educated in one of the monasteries of Nola or by a private teacher. In 1477 he moved to Padua, where he studied medicine and philosophy with Nicoletto Vernia and Agostino Nifo and where he graduated in both in 1484. After his return to Nola, he practiced as a physician in villa Schivacura (near Mount Cicala), which soon became a meeting place for men of science and letters. He became acquainted with Gioviano Pontano, whom he hosted during the plague in 1493. Nearly nothing is known about his life between 1490 and 1498, with an exception made for his love story with Beatrice de Notariis, who died in 1491 and whom he intended to honor with a collective poem (involving E. Strozzi, A. Tebaldeo, G. F. Caracciolo, and J. Sannazaro), entitled *Beatricium*, never published. Between the

end of 1499 and the beginning of 1500, he moved to Padua, where he attended the home and the coterie of friends of Aldo Manuzio. Before 1504 he returned to Nola, but in 1505 he settled in Venice, where he practiced medicine and started to study Greek, gaining a reputation with the members of the Aldine Academy and Erasmus, with whom he had befriended when he supervised the printing of the *Adagia* in Venice in 1508.

In 1514 he published *De Nola*, which, based on ancient rather than on recent sources, was the first product of Neapolitan humanist historiography. In 1517 Leone published the *Castigationes in Averroem*, in a first edition of 30 books (then followed two editions: in 1524 of the third part only and an integral edition in 1532), containing a long list of abuses. In his critique Leone combines two principal anti-Averroist responses: humanist historicism and pristine Aristotelianism. His agenda is both rhetorical and metaphysical. In the dedicatory letter to Leo X, he presents Averroes as a liar, an unreliable interpreter, a corruptor of epistemological and ethical norms, a defiler of the truth, impious, a weak logician, an uncouth philosopher, and a braggart. But worse of all was that Averroes hoped to make a name for himself in philosophy by ridiculing all religion.

On July 19, 1518, he wrote a long letter to Erasmus, in which he mocked his friend for his tireless and multifaceted activity, calling him a novel Proteus and reviving Ulysses. In the same year, he published an edition of the works in prose of Gioviano Pontano and published a translation of Johannes Actuarius' *De urinis*. At the end of 1519, he received a letter from Erasmus who congratulated him for the publication of the works, particularly the one against Averroes. In August of 1523, he published the ponderous *Opus Quaestionum seu problematum*, where he discussed, in addition to ethical issues, physiological and medical questions, including problems in physics, geometry, optics, and music. His last published work in life was *De nobilitate rerum dialogus* (Venice 1525). From information about some unpublished works, we know that Leone also carried out research on antidotes against the poison of serpents and in the care of nephrology, diseases of the kidney, and meteorological issues. The dedicatory letter of *De nobilitate rerum* informs about manuscript works,

including “Libellus de Bisexto,” “De vi ridendi,” “Lucubrationes in VI Methaphisices,” “Libellus de signis pluviarum et ventorum,” and “Adnotationes in theriacam.” On the evening of March 6, 1525, after 2 days of agony, he died, hit by a stroke.

Leonhard Fuchs and Herbals

Born: 1501, Wemding [Bavaria]

Died: 10 May 1566, Tübingen

Alain Touwaide

Institute for the Preservation of Medical Traditions, Washington, DC, USA

The Huntington, San Marino, CA, USA

Abstract

A learned physician, Leonhard Fuchs is mostly known for his illustrated herbal entitled *De historia stirpium*, first published in 1542.

With this work (which preceded by one year *De humani corporis fabrica* of Andreas Vesalius), he is believed to have renewed the typically medieval genre of the herbal, although he also played a major role in other sectors of Renaissance medical production, including the revision of contemporary scientific (especially medical) literature on the basis of Greek classical texts in the way of Nicolao Leniceno. Nevertheless, his most significant contribution was his herbal and its illustrations, the text of which is in fact an assemblage of pieces translated from Greek and Latin classical literature on botany and materia medica (plants used for therapeutic uses) and the illustration drawings made on the basis of specimina collected in nature.

Biography

Born in the town of Wemding in Bavaria, on an unknown date in 1501, Leonhard Fuchs graduated in arts at age 16 (1516–1517) and enrolled at the medical school of the university of Ingolstadt in 1519 where he obtained the title of *Magister artium* in 1521 and of *Medicinae doctor* in 1524. After a couple of years as a practitioner physician and, further on, as a teacher, he accepted a position as the personal physician of the Margrave of Brandenburg in Ansbach. Though successful, he renounced this position in 1535 for a chair of medicine at the University of Tübingen, with the mission to reform the university. Immediately appointed dean of the medical school, Fuchs became a rector of the university the following year (1536) and wrote new statutes as early as 1538. Several times confirmed as rector until 1565, he nevertheless devoted himself to the study of botany and materia medica, producing in 1542 the richly illustrated *Historia stirpium* (Fuchs 1542), which he further revised in the form of the German *New Kreüterbuch* published in 1543 and aimed at a wider audience (Fuchs 1543). Although he pursued his research to expand *Historia stirpium* with three more volumes completed in manuscript form in 1563/1564 (including the illustrations), he could not find the necessary resources to publish it. He died in 1566, not only sick but also

discouraged by this failure, in addition to being probably depressed by the death of his wife in 1563 (Brinkhus and Pachnicke 2001).

Heritage and Rupture with the Tradition

Historia stirpium is the direct heir of a line of transformation of the botanico-therapeutic genre of the herbal, typical of western medical literature (in Byzantium, this genre did not develop so markedly as botanico-medical literature was limited to Dioscorides, *De materia medica*). The renewal of the genre started by Otto Brunfels (1588–1534), author of an illustrated *Herbarium* first published in 1530. In it Brunfels departed for the first time from the medieval tradition both in the description of the plants (made of excerpts from classical literature) and the illustrations (no longer schematic, but aiming at naturalism). Like Brunfels, Fuchs compiled information from classical Greek and Latin sources, mostly Theophrastus, Dioscorides, Pliny, and Galen. Contrary to Brunfels, however, who exactly reproduced the individuals he obtained from the field, Fuchs extracted the concept of the plants he was studying, thus producing a visualization of the botanical characteristics allowing for exact identification.

Innovative and Original Aspects

Fuchs' innovative activity went beyond and started well before the publication of the *Historia*. A Hellenist walking in the footsteps of Ferrara physician Nicolao Leonicensi (1428–1524) (Samoggia 1964), Fuchs screened the medical literature of his time, denouncing in a typically Renaissance fashion what contemporary classicizing scientists and physicians considered mistakes. As early as 1530 he published a small book the title of which was a manifesto: *Errata recentiorum medicorum* (*Errors of modern physicians*). The moderns were not only Fuchs' contemporaries as Otto Brunfels, accused to have sometimes misidentified the plants he described because he did not really know them, but also – and mostly – the Arabic physicians, harshly – and sometimes incorrectly – criticized for having deformed Greek medicine (Harig 1966).

Impact and Legacy

On these premises, Fuchs transformed the medical curriculum at Tübingen University. Not only did he eliminate the Arabic texts (studied in the form of their medieval Latin translations) from the program, but also he introduced the practice of didactic *herborisation*, that is, expeditions in the field to collect the plants traditionally used at that time for therapeutic purposes. Typically enough, *herborisation* was also introduced at the same time at two famous medieval medical schools, those of Padua and Montpellier, being supplemented in 1542 at Padua by a botanic garden aimed to provide plants on a more permanent basis. Together with related teaching, *herborisation* allowed for direct knowledge of the plants by the students, making it possible to avoid the confusion (potentially harmful) resulting from the uncertainty of nomenclature in medieval literature. The specimina collected in nature were also used by the artists working to illustrate *Historia stirpium*, as the full-page illustration included in the volume makes clear, being a further manifesto of Fuch's self-identity as a reformer (Kusukawa 2012). In the upper part, the artist (Albrecht Meyer) reproduces a plant in front of him, while another in front of him (Albrecht Füllmauer) transfers the drawing to a woodblock. Below, in the lower part of the page (a position that might be significant), a third personage (Veit Rudolph Speckle) is represented without any sign of his activity, which consisted in carving the blocks. The translation of the work into German, together with its adaptation for a larger use, is no less typical of Fuchs' *modernism* with a shift from Latin as the lingua of science, to the vernacular.

Leonicenso, Nicolò

Born: 1428, Vicenza

Died: 1524, Ferrara

Alain Touwaide

Institute for the Preservation of Medical Traditions, Washington, DC, USA

The Huntington, San Marino, CA, USA

Abstract

A major humanist physician and Hellenist, owner of a conspicuous library, translator of Galen, editor of Dioscorides in Greek, and

promoter of a new scientific epistemology, Leonicenso was also a teacher at Ferrara University. He is most known for the so-called *Pliniana controversio*, which has traditionally been analyzed as a *quarrel of Ancients and Moderns*, the Ancients being the Latinists and scholars of Pliny, while the Moderns were the Hellenists and readers of Hippocrates, Dioscorides, and Galen. Leonicenso's contribution went beyond as it transformed the early humanistic approach to classical Greek and Latin scientific literature into an epistemologically sound and scientific analysis of ancient medical texts. Though laying down the basis of a method for a deeply renewed appropriation of ancient scientific literature, his proposals provoked a stasis in Renaissance science and scientific literature which lasted a quarter of a century.

Biography

Born to a noble family of Vicenza in northern Italy, Nicolò Leonicenso received in Vicenza a solid classical education under the direction of the first-generation humanist Ognibene de' Bonisoli (1412–1474). With perfect knowledge of classical Greek and Latin, he enrolled at age 18 at the nearby famous medieval university of Padua, where he graduated in arts and medicine sometimes around 1453. After some years of travel (mostly to England but possibly also to Holland), he seems to have taught at his Alma mater in 1462–1464. In any case, in 1464, he moved to Ferrara where he spent his entire life, with the exception of two teaching stays in Bologna (1483 and 1508–1509) and occasional brief visits to other cities in northern and central Italy. Appointed professor at the University of Ferrara, he might also have been a physician to the local court in the 1470s. During the years 1470–1490, he translated several works of classical Greek and Latin literature unrelated to his scientific interests, perhaps upon request of the court. Leonicenso was in contact with most of the leading intellectuals of his time, including the printer and publisher Aldo Manuzio (ca. 1450–1515) established in Venice. He actively participated in the printing of the monumental Aldina edition of *Aristotelis Opera*

omnia (5 volumes, 1495–1498), among others by lending his own manuscript copies of some works, and he probably prepared the edition of the Greek text of Dioscorides, *De materia medica* published by Manuzio (1499). Besides Latin translations and critical editions of Greek scientific texts, Leonicenso wrote original works, including the first treatise on syphilis (*De morbo gallico*), published in 1497 by Aldo Manuzio. Giovanni Manardi (1462–1536) (Premuda 1963, Samoggia 1963, and Carrara 1994) and Antonio Musa Brasavola (1500–1555) were among his students in Ferrara. Leonicenso died there in 1524 (Carrara 1978).

Heritage and Rupture with the Tradition

An assiduous reader of Greek and Latin classical literature – particularly philosophical and scientific –, Leonicenso assembled a conspicuous library (possibly containing 3000 volumes), the catalog of which was rediscovered only recently. Although he translated literary texts, he was mostly interested in ancient philosophical, scientific, and medical literature, with a particular focus on Galen in addition to Hippocrates and Dioscorides.

Of Galen, he translated into Latin (in chronological order of publication, all having been reprinted several times): *Ars medicinalis* (1508); *In Hippocratis Aphorismos* (1509); *De arte curativa ad Glauconem*, *De crisis*, *De differentiis morborum*, and *De inaequali intemperatura* (1514); *De differentiis februm* (1516); *De morborum differentiis et causis* (1522 [?]); *De motu musculorum* (1522); *De naturalibus facultatibus* (1524); *De elementis secundum Hippocratem* (1541–1542; posthumous). Also, he procured Greek manuscripts of *Methodus medendi* and *Ad Glauconem* to the publishers of the first printed Greek edition of Galen, the Greeks Zacharias Kallierges (ca. 1433–after 1524) and Nikolaos Vlastos (fifteenth/sixteenth century), who printed these texts in 1500 in Venice. As a complement to – and defense of – his translations, he published works such as *Praefatio communis in libros Galeni a graeca in latinam linguam a se*

translatos (1508), *Contra suarum translationum detractores apologia* (1522), and *In suam ac Teodori Gazae defensionem contra Adversarium Libellus* (compiled between 1513 and 1528 and unpublished). Based also on his study of Galen's works and his translations (particularly the *Ars medica*), Leonicenso compiled a methodological essay on medical method first published in 1508 and several times reprinted (*De tribus doctrinis ordinatis secundum Galeni sententiam*).

Through his production, Leonicenso advocated reading Greek medical literature rather than the medieval treatises in Latin (Nutton 1993, 1997a), most of which resulted from the translation of Arabic texts into Latin. This was particularly the case for Galen's *Ars medica*, the interpretation of which in the late Middle Ages was dominated by the Aristotelo-Averroist reading diffused and confirmed among late-medieval philosophers and physicians by Pietro d'Abano (ca. 1250–1315 or 1316) in his *Conciliator differentiarum philosophorum et praecipue medicorum*. Leonicenso was interested in defining *method* as a philosophical concept allowing for a logical structuration of the entire field of science.

In *Ars medica* (which he compiled late in his life, 1493), Galen made a systematic exposition of pathology starting with a general definition of medicine and proceeding by further divisions and definitions. The work opens with a short prologue on three methods for teaching differentiated by their starting point: the whole and the aim (the whole body), which is subsequently analyzed; the sum (synthesis) of the data resulting from analysis; and the successive divisions of definitions (which is the method followed by Galen in *Ars medica*) (Boudon 2000). Following Galen, rather than Aristotle and his medieval commentators, Leonicenso proposed clear definitions of such fundamental scientific concepts as *definition*, *demonstration*, *division*, and *resolution* (Edwards 1976 and Carrara 1983). With these concepts, he aimed to rebuild science on a solid basis.

A clear application of this new epistemological strategy was medical botany and remedial therapy. According to Leonicenso, the medieval texts (particularly the Latin translations of Arabic

treatises resulting themselves from the translation of Greek originals into Arabic) misinterpreted numerous technical terms. The massive operation of translation from Arabic into Latin during the Middle Ages generated a great lexical variety of plant and medicinal names, particularly because of the process of transliterating Arabic terms into Latin alphabet, instead of properly translating such terms. Scribal mistakes in manuscript copies added to this vast lexicon. As a result, lexica such as Simo of Genua's *Clavis sanationis* compiled in the late thirteenth century, collected all such terms, also providing explanations and equivalents for their correct understanding. This lexical uncertainty was crucial in the field of therapeutics, where incorrect identification of plants and, consequently, administration of other plants than the ones recommended for the treatment of a medical condition, could be noxious, if not lethal.

In a time when apothecaries were accused of selling adulterated or even wrong drugs, Leonicens started working on plant lexicology. In 1492, he published a small pamphlet entitled *De Plinii et plurium aliorum in medicina erroribus liber* (Premuda 1958). The colophon is indicative of the actual content of the work: *Plinii ac plurium aliorum acutorum qui de simplicibus medicaminibus scripserunt. Errores notati ...* The multiple cases collected in this booklet aimed to demonstrate the superiority of Greek texts over classical Latin and medieval ones, the latter including mostly the canonical textbooks of medieval medical schools made of Latin translations of Arabic works. Classicizing scholars – most of them being Latinists–viewed this pamphlet as an attack against the authority of Pliny's *Naturalis Historia*, which had been used in the Middle Ages as a reference in multiple scientific fields, whereas Leonicens's work mostly targeted the *Arabici auctores* and *Arabicae translationes*, accused of having deformed the Greek heritage. A virulent polemic led by Pandolfo Collenuccio (1444–1504) followed (Santoro 1956). Collenuccio authored a *Pliniana defensio ... adversus Nicolai Leonicensi accusationem* published in Leonicens's own city, Ferrara, without date, but probably in 1493. Although

Collenuccio brilliantly defended the *Naturalis Historia*, Leonicens was able to demonstrate the validity of his thesis, putting soon an end to the polemic (Castiglioni 1953). Notwithstanding, Leonicens pursued his reflection on scientific lexicology.

Innovative and Original Aspects

Leonicens's work in this field took the form of five other booklets published between 1493 and 1529, to which we should probably add the critical edition of the Greek text of Dioscorides, *De materia medica*, printed in 1499 by Aldo Manuzio. Though published anonymously, this edition might have been prepared by Leonicens who wished to provide with it the necessary material to demonstrate the validity of his thesis on the superiority of Greek, over Latin and medieval scientific literature.

In Leonicens's reflection on the proper identification of the natural substances to be used for the preparation of medicines, the flesh of snakes to be mixed in the preparation of theriaca was a significant case. On this topic, Leonicens wrote the small tract *De Tiro seu vipera* printed sometimes between 1497 and 1499, possibly by Aldo Manuzio. He returned to this question in 1503, in a letter to a physician who interrogated him about the identity of several medicinal substances. There Leonicens reached the contradictory conclusion that the naming of things might not be as important as he initially thought, provided the objects identified by the names (whatever these names might have been) were properly identified. This paradoxical conclusion, fundamentally lexicologically agnostic if not anti-lexicological, was encapsulated in Leonicens's formula "*Loquantur ipsi ut velint ... modo quis serpens sit tirus... non ignorant*" (Touwaide 2000).

Impact and Legacy

Leonicens's program of control of the substances to be used in the preparation of medicine might

have inspired the preparation of what can be considered an early Pharmacopoeia in Florence. Toward the end of the fifteenth century, the civil authority of Tuscany commissioned a group of *doctores* to revise the formulae for medicines prepared by apothecaries in the duchy. The work of this commission resulted in the compilation and publication of the so-called *Ricettario fiorentino* (1501), which listed all the formulae for compound medicines considered safe and consequently approved and guaranteed as efficacious by the Florentine medical authority.

Leonicensi's criticism of medical literature, be it medieval or contemporary, was reproduced in the German world by Leonhard Fuchs (1501–1566) who authored the *Errata recentiorum medicorum* (1530) in which he screened contemporary production searching for lexical and medical mistakes (Samoggia 1963, 1964).

However promising Leonicensi's method might have seemed for a refund of therapeutic practice (Bruni 1995), it acted in the opposite direction after having generated a first application, possibly with the *Ricettario fiorentino* and certainly with Fuchs' *Errata*. No new work was published for 30 years and, in any case, new works were slow to appear. In 1530, the German botanist Otto Brunfels (1488–1534) published his *Herbarum vivae eicones* with illustrations of plants by Hans Weiditz, with a second volume in 1532 and a German edition in two volumes in 1532–1537 (*Kreüterbuch Contrafayt*). No other work appeared until 1542, when Leonhard Fuchs published his *Historia stirpium*.

At around the same time (the early 1540s), lexicological exactness in the way of Leonicensi returned to the pharmaceutical analysis recalling the *Ricettario fiorentino*. Antonio Musa Brasavola, a student of Leonicensi, visited Italian pharmacies to inspect the materia medica used for the preparation of medicines and verify the formulae of medicines. Upon completion of his inspections, Brasavola published a series of small volumes listing the correct ingredients for the preparation of medicines and describing the formulae for medicines. Interestingly enough, after a review of the ingredients (*Examen*

omnium Simplicium medicamentorum, quorum in officinis usus est, 1536), he proceeded by pharmaceutical types or therapeutic activity, with the syrups (*Examen omnium syruporum, quorum publicus usus est*, 1540), trochiscs, unguents, cerats, emplasters, cataplasms, and collyria (*Examen omnium trochiscorum unguentorum ceratorum emplaforum cataplasmatumque & Collyriorum quorum apud Ferrarienses pharmacopolas usus est* ..., 1541), pills (*Examen omnium Catapotiorum, uel pilularum, quarum apud Pharmacopolas usus est*, 1543), electuaries, powders and cathartics (*Examen omnium electuariorum, pulverum, et confectionum. catharticum*, 1548), and lochs, powders, waters, decoctions, and oils (*Examen omnium Loch, idest Linctuum, Suffuf, idest Puluerum, Aquarum, Decoctionum, Oleorum, quorum apud Ferrarienses pharmacopolas usus est*, 1553). All works were abundantly republished during the 1540s and 1550s.

Shortly afterward, the center of gravity of this methodological refund of medical botany and pharmaceutical practice shifted from Ferrara and Leonicensi's sphere of influence (Castelli 1997 and Nutton 1997b) to Padua, at the university of which a chair in medical botany (*lectura simplicium*) was created in 1533. Students could acquire a direct knowledge of plants through herborization in the field during the spring term, and, during the winter term, through the botanical garden created in 1545. This model had been further reproduced in Montpellier thanks to the bishop of Maguelone, Guillaume Pelicier (1498 or 1499–1568), who stayed in Venice during the years 1539–1542 as Ambassador of the French king to the Serenissima and took advantage of his presence in the Veneto to acquire a collection of books that included editions and translations of natural history works among which Dioscorides, *De materia medica*.

Leonicensi's work, which probably contributed to the development of these new initiatives in the methodology for the study of medical botany, became obsolete and moved from the making of humanistic science to the history of humanism in science.

Abstract

Niccolò Leonico Tomeo was a Paduan humanist who devoted his long life to classical scholarship. Excellent connoisseur of the Greek language, he studied and translated Plato and Aristotle directly from the original texts, refusing to resort to scholasticism and medieval annotators. Tomeo amassed a vast library of

Greek philosophers and scientists and surrounded himself with young men who went to Padua from all over Europe to follow his lessons. After lecturing on Aristotle in Padua and Venice until 1509, he privately taught Plato because – as other humanists were – he was persuaded that Platonic and peripatetic theories had to be conciliated against the spreading Averroism. This perspective is well-shown by his major philosophical work, the *Dialogi*.

Biography

Son of Biagio and Polissena, Niccolò was born in Venice in 1456 and moved to Padua with his brother Bartolomeo, called Fusco; his surname must be probably retraced to his family's place of origin, which was the town Ithomi in Messenia. When he was young, he learned Greek in Florence with Demetrios Chalkondyles and afterwards completed his education in Padua, with a degree *in artibus* on 7th May 1485. In this period, he shared the goliardic life of Padua with his friends Tifi Odasi and Domizio Parenzo. Then he turned to ancient medicine and philosophy, becoming quickly very expert; from 1497 to 1509, he held the lectureship of Aristotle on the Greek text in Padua. From 1504 to 1506, he taught Greek and Latin in Venice, after winning Marcus Musurus in the competition. When he came back to Padua, he went on teaching privately to foreign intellectuals who met in his house: William Latimer, Thomas Linacre, Thomas Lupset, Richard Pace, Reginald Pole, and Cuthbert Tunstall. The Italian Pietro Bembo, Lazzaro Bonamico, Paolo Canale, Giovanni Benedetto Lampridio, and Giovanni Calturnio frequented him too. Relationships with them are known, thanks to the collection of Tomeo's letters, testified by the ms. Vat. Ross. lat. 997, related to the years 1521–1531. Erasmus of Rotterdam knew and appreciated him. In 1519, his sister Agostina with her children Magno, Paolo, Angelo, and Laura joined Leonico in Padua. He died there in 1531, when he was 75 years old, and was buried in S. Francesco church (De Bellis 1980; Geanakoplos 1985;

Russo 2005). His nephew Magno inherited his library and kept it until the beginning of the 1540s. Pietro Bembo, who had known Tomeo as a master and a friend, acquired almost the whole collection. Later on his death (1547), Torquato Bembo sold it together with the library of his father, and several collectors like Gian Vincenzo Pinelli, Fulvio Orsini, and Jean-Jacques and Henri de Mesmes bought some portions. Tomeo's manuscripts are therefore today dispersed in libraries all around the world, such as the Biblioteca Ambrosiana in Milan, the Vatican library, the Bibliothèque nationale de France, and the Burgerbibliothek in Bern. About 50 exemplars have been found so far (Gamba 2014).

Works and Themes

The most famous works by Tomeo are his Latin translations of Aristotelian treatises, which he chose among those not yet available to the Latin world or not studied neither at a university level. Although he had been making them since he was young, most were published in the last decade of his lifetime, when his friends persuaded him to do so. Their value resides in Tomeo's wide knowledge of Greek and his philological and philosophical accuracy, which are also the reasons for his success.

In 1523 was published the *Parva naturalia*, destined to become the edition used in school teaching and to have several reprints in the succeeding centuries. In the preface, he stated that he had decided to imitate ancient commentators and ignore medieval and contemporary ones (Kraye 2002).

In 1525, he collected various works under the title *Opuscula*: the translations of three Aristotelian treatises, on zoology (*De animalium motione* and *De animalium incessu*) and physics (*Mechanica*); a translation of Plato's *Timaeus* with Proclus' commentary (*De animorum generatione, cum explicatione et digressione Procli Lytii [sic]*), which shows Tomeo's attraction to Neoplatonic metaphysical theories; and *Quaestiones amatoriae* and *Quaestiones naturales*, two original works inspired by the

peripatetic tradition and focused on the etiology of lovers' behavior and problems about zoology, human physiology and anatomy, botany, and mineralogy (De Bellis 1975).

Two other less known translations are the astronomic Ptolemaic treatise *Inerrantium stellarum significationes* (1516) and the *De puero epileptico* by Galenus, edited posthumously in 1541, which testify Tomeo's passion for scientific topics.

In 1531 was published a juvenile miscellaneous and erudite work, *De varia historia*. Tomeo collected in it mythological episodes, etymologies of geographical names, and other curios he found in ancient authors, so that the work seems more an adaptation and translation of excerpts than a genuine product of his pen.

After his death, his nephew Magno Tomeo found a manuscript with Leonico's Latin translation of the first book of the Aristotelian *De partibus animalium* and had it published in 1540. Tomeo wrote it in the late 1520s, with the declared purpose of doing a complete translation of the zoological work that Pietro Pomponazzi had previously begun to gloss on behalf of Ercole Gonzaga, but had left incomplete because of his death (Perfetti 2004). Tomeo too died before finishing the work and we nowadays can read only his version of the first book: *Conversio atque explanatio primi libri*. It is a translation with commentary, very graceful in its Latin style, which paraphrases and sums up the Aristotelian argumentations and clarifies the line of reasoning when it seems too tortuous. Tomeo tried to act as an ancient commentator, dealing directly with the Greek text and refusing to use either the scholastic jargon or its fixed formulas of textual exposition (Perfetti 1999); his authorities were just Theodorus Gaza, who had made a good humanistic translation of the same text, and Alexander of Aphrodisias. Besides, he reflected upon the methodological foundations of this zoological work, which follows an inductive logic according to his genre, and noted that it was different from the deductive method that Aristotle supported in his *Analytics*. Even

though he was always very careful in referring to Aristotle's thought, he contaminated some passages with Platonic elements (Perfetti 2000).

Among his original works, it is worth mentioning the *Dialogi*, a collection of dialogues of Ciceronian-Platonic form on several topics, published in 1524. Their guiding thread is Tomeo's effort to prove that Plato and Aristotle agree about the major philosophical matters, as many other humanists did. Some dialogues deal with the soul and reveal Tomeo's closeness to the Neoplatonic positions developed in Florence, above all, those by Marsilio Ficino (De Bellis 1979): in *Bembus, sive de animorum immortalitate*, for example, he used the Platonic *Phaedrus*' arguments to show that Plato's and Aristotle's seeming contradiction about the soul's immortality was just terminological. In *Alverotus, sive de tribus animorum vehiculis*, he discussed the afterlife, vehicles of the soul, the possibility to expiate sins, and the existence of fate (De Bellis 1981). *Trophonius, sive de divinatione* and *Sadoletus, sive de precibus* are about religious matters. In the first one, the last ancient oracle, visited and described by Pausanias, is the pretext to talk about divination, which is thought to be an expression of natural religiousness, because the divine issues directly from earth disguised as the spirit (Carabelli 2002). The second one compared anthropomorphic paganism with Christian providence and discussed how human prayers could influence divine will (D'Ascia 1990). Interesting themes touched on the dialogues are also: the naturalness of language; the conflict with contemporary philosophers, who are similar to the Sophists and sell their knowledge; the logical relation of a relative term and its correlative; and the role of grammarians.

Tomeo's contribution to the history of the culture is also linked to some editions of classical authors, which were prepared with manuscripts belonging to his vast library. This is the case of Aldine editions of Aristotle and Theophrastus (1495–1498), John Philoponus (1504), Plutarch (1509), Pedanius Dioscorides (1518), and Galen (1525), of the Aristotle published by the Giunta typographers (1527) and Plutarchan *Moralia* by

Froben (1542). Before the printing of the aforementioned Plutarch of 1509, Tomeo helped the editors Marcus Musurus and Demetrios Doukas in revising the Greek text. Besides, his corrections of the Greek text of *Moralia* were well known in the Italian Renaissance, because circulated in manuscript form; his autograph emendations written in the margins of his 1509 edition (now detected as the Ambrosian exemplar press-marked S R 67) were copied in many other editions, such as those belonging to Donato Giannotti and Fulvio Orsini (Martinelli Tempesta 2004).

Libertines and Libertinism

Abstract

Libertinism designates a movement of intellectual pursuit and moral attitude that manifested itself intensely between 1620 and 1640 and that, for diverse reasons, can be seen as preparatory to the enlightenment. Libertinism

continued and evolved well beyond these decades. However, the attitude of doubt and skepticism that are identified as its core ingredients emerged earlier on. For its first uses in history, “libertinism” refers us to Calvin (1544 and 1545), who launched an attack against the Anabaptists as a sect of unbelievers. Henceforth, throughout the sixteenth century, *libertinus* reemerges in polemical literature signifying, depreciatingly, an unbeliever. Yet, not all unbelievers or non-Christians were libertines. Polemics of the seventeenth century show the complexity and multifaceted nature of libertine writing and *status quo*. Unsurprisingly, libertinism poses the problem of categorization of thought from a historical perspective. Categories are conditioned by a unifying thought and theme, by coherence and more or less conscious structuring of ideas among a specific group of thinkers and writers. However, ideology is bound to affect classifications, and approaches to the historiographical phenomenon of libertinism have long been determined by historians’ own morality and Christian worldview. The word “libertine” continued to be used in the pejorative sense by historians from the end of the nineteenth century until well into the twentieth century. See, for example, Lucien Febvre’s *Le problème de l’incroyance* (Febvre 1942) and the influential work by René Pintard (1943). However, subsequent decennia, and especially from the 1970s on, demolished significantly this approach that was marked by a Christian moralistic mindset and referentiality (in part *Le problème de l’incroyance* (Schneider [1970] and, recently, Cavaillé’s publications, 2001, 2011, esp. 2002). The early modern *libertinus* – in Roman Antiquity, a freed, liberated slave – has since been revalued and reappraised as the one who dares to put into question established dogmata, a freethinker who reasons unstrained by theological principles, religious ethics, or any type of systematic belief. This cannot be entirely dissociated from the implications free thought bears in favor of *liberté des mœurs*, announcing eighteenth-century sexual libertinism.

Synonyms

Esprits forts; Freethought; *Libertinage érudit*; *Libertinage*

Heritage and Rupture with the Tradition

Resulting from a specific reading culture and an intellectual cum ethical attitude – that of almost tireless criticism toward (*en*)*doxa*, credulity, and political power in place – libertine thought was first shared within a network primordially active in France and Italy, then followed by others and well into the eighteenth century. While pre-1950 studies attempted to frame the first decennia of the seventeenth century as a period of crisis of consciousness, Gregory (1981) situated libertinism back in its historical and cultural reality by reconstructing it. This did not withhold Charles-Daubert (1998) from distinguishing as a main structuring theme the intellectual desire for distinction: a distancing from the superstitious and credulous crowd and Christian morality on the one hand, and, on the other, detachment from theology and the foundations of power. Bianchi (1996) states that libertine thought is principally characterized by a wish to desacralize. Similarly, Cavaillé (2007) states that, fundamentally, *libertinage* equals religious criticism. However, much the domain of study evolved, Pintard’s seminal work is still cited today, especially for the rich repertoire it contains of biographies and primary sources located in sundry, principally French, archives and libraries. However, while the period in-between Renaissance, modern science, and mechanistic philosophy was occupied by what Pintard defined as *libertinage érudit*, this does not imply that libertines’ erudition by definition contradicted or retarded scientific thought, as suggested by Pintard (1943/ 2000), Spini (1950), Febvre (1942), Lenoble (1943). Nor does libertinism’s indebtedness to sixteenth-century critical philology and naturalism signify that it was just their Cartesian continuation.

In general terms, skeptical thought does not exclude conformism in the individual’s relation to the external world. As for the cleavage between

public and private life, scholarship of libertinism often makes a direct link with Michel de Montaigne's reflections on that matter in his *Essais* (Montaigne 2007). On account of the skeptical, and more precisely Pyrrhonian, characteristics of some major tenets in his work, the French philosopher is often seen as one of the main, if not the chief, precursors of early seventeenth-century libertine thought. Although it has been shown that Montaigne was read by some libertines, thus probably influencing certain among them, it could also be argued that that generation of libertines was chiefly prepared by a whole set of pre-Descartes figures and worked within a current of rationalism and science, critically evaluating sources and experiments, as well as questioning the religious worldview and the religious and political entanglement.

There is an interrelatedness of different approaches internal to libertinism: rationalist criticism (Naudé), skepticism (La Mothe Le Vayer), and radical atheistic naturalism (*Theophrastus redivivus*), all concurred in a redefinition of the ancient historical order based on a providential model. Together with anti-magical and anti-astrological criticism, they built a new valuation of human behavior and another consideration and reconstruction of past events. This mosaic of attitudes would later converge in Pierre Bayle's 1697 *Historical and Critical Dictionary* (Bianchi 1996).

Reformation, Philology, History

The beginnings of libertinism have often been identified with that of reformation thought and the movement that put into question, through philological approaches, the Catholic Church's institutional authority, and dogmata. Recognizing that the Mosaic Law was a text with its own history, not absolute and itself subject to discussion, emendation, and revision, implied a distinction between the religious and theological discourse on the one hand and, on the other, nature and human perception, experience, and discovery. Even before Erasmus and Rabelais, in particular through philosophers like Giovanni Pico della Mirandola and Marsilio Ficino, late fifteenth-century Italian and especially Florentine

Renaissance had foregrounded the (re)discovery of non-Christian sources, the kernel of validation of non-Christian truth systems. This intellectual attitude combined with the discovery of the New World would also be at the origin of anthropology, and Montaigne, as well as La Mothe Le Vayer's curiosity for other, non-Christian cultures and beliefs, relativized divine revelation.

No writer or philosopher of the early Reformation was a free-floating neutron and their writings often had a readership that extended beyond their contemporary milieu to intellectual posterity. The popularity of Erasmus, for example, among the members of an elaborate network of French and Italian Protestants and anti-papists active during the 1550s through the early 1570s, has been extensively demonstrated (see especially Seidel Menchi 1974, 1987). In fact, from these decades on, intense exchanges between French and Italian networks would continue well into the seventeenth century and determine much of the libertine movement.

Ancient Philosophy of Nature

Harking back to the Classics as examples of free-thinking was common among libertines. But these sources also needed to be unstrapped from the Christian veil of interpretation they had received over centuries. Italians like Cesare Cremonini, Galileo, and Tommaso Campanella put into question science based on Aristotelian ideas as validated by Thomistic (theological) reasoning. It is not surprising to see libertinism linked to sixteenth-century Epicureanism and to Paracelsian thought (polymaths like Girolamo Cardano, Giordano Bruno, Machiavelli, Marin Mersenne, etc.). In his 1635 paradoxical praise of Nothing, Luigi Manzini (also a member of the Venetian *Accademia degli Incogniti*) breaks away from tradition by considering Nothing as an absolute value outside the created world and combining elements of Lucretian cosmology with theories of atomism and a plea for freedom of conscience (Ossola 2007). See the ERP article by Palmer on Epicureanism and Palmer 2017, on Renaissance reception of Epicurean ideas such as atomist physics and materialist models of nature on the one hand – ideas discovered through Cicero,

Lucretius, and Diogenes Laertius – on the one hand, and, on the other, their negative stigmatization as signs of heresy, atheism, and hedonism of all sorts, in the context of the Reformation and Counter-Reformation. A materialistic tendency can be traced among philosophers of nature such as Gassendi, Ismaël Boulliau, Giambattista Vico, and Francis Glisson, but the representation of the work of Gassendi or even Vico as entirely materialistic has created caricatures.

On the meta-scientific level, the libertine questioning shared among all those figures – be it primarily philologists or principally philosophers of nature or scientists – is indebted to the debates on double truth and future contingents that took place by the end of the Middle Ages (Bianchi 2008; Landucci 2006; Bianchi and Randi 1993; Maier 1955) and pushes them further down the path of scientific discovery and historical criticism.

Networks: Public Versus Private

The mid-sixteenth century intellectual upheaval and revaluation of orthodoxy had as one of its consequences the Christian Inquisition's censoring of books as well as persecution and murdering of dissidents. This not only increased the circulation of clandestine literature, but also led to the development of libertine literature as the "art of clair-obscur" (Moreau 2007). Elusive, perplexing, and encoded language thrived especially in North-Italian private circles organized as sixteenth-century academies, but one should be aware that not each academy was a priori a circle of controversial thinkers. In those academies, the literary genre of the *impresa* (which held its origins partly in heraldry and court culture) developed into an expression of truth by reference, not to a monastic ideal or to the proclamation of One True Church, but to the worldly lives of individuals (Chayes 2019). During the first half of the seventeenth century, libertine networks were characterized by the splits of individuals who, on the one hand, were integrated parts of institutional power and, on the other hand, screened the privacy of their circles and literary cum philosophical expressions and exchanges. As focal points of networks between France and Italy one can mention the

dwelling of the Dupuy brothers in Paris and the *Accademia degli Incogniti* in Venice in the house of Gianfrancesco Loredano (Infelise 1997; Miato 1998). Nor cautious screening of private opinion from the public nor encoded language could prevent persecution, death penalties, and censorship to be exerted. Among those who were not spared were people like Giulio Cesare Vanini, burnt on the stake in 1619, Tommaso Campanella, imprisoned several times and sentenced to life imprisonment, and Ferrante Pallavicino, beheaded in Avignon in 1644.

Innovative and Original Aspects

Without reference to an extraneous, absolute, immovable truth, early seventeenth-century libertinism embraced nature's paradoxes, infinite possibilities and meanings, as well as human ignorance. In many cases, this meant the endorsement of ambiguous composition that encrypted private opinions. Although certainly driven by a desire to polemicize, the authors had the double aim to avoid the "vulgarization" of their thought and escape censorship and persecution. Historical discourse was stimulated in an innovative way by the absence (or desire thereof), within libertine critical discourse, of reference to any theological authority or religious framework.

A turning point in historical attitudes toward tyranny and democracy can be traced in Etienne de la Boétie's *Discours de la servitude volontaire* (La Boétie 2016), printed in French in 1576. According to Scévole de Sainte-Marthe in his *Eloge de la Boétie*, this treatise contained "matières un peu trop chatouilleuses et trop délicates [...] conçues avec un peu plus de liberté que la saison ne pouvait souffrir." During the eighteenth century, the Protestant Pierre Coste republished the work. A century earlier, the Venetian rabbi and skeptic Simone Luzzatto had advanced arguments against the rule of the tyrant and that of the populace in his *Socrate* (1651). A friend of the French Ambassador to Venice and a rabbinic teacher of Charles de Valliquerville, Simone Luzzatto was closely related to the libertine network that included Gabriel Naudé, Ismaël

Boulliau, Ferrante Pallavicino, and Giovanni Francesco Loredano. The *Reasons for Naturalizing the Jews in Great Britain and Ireland* (1714) by the freethinker John Toland was indebted to Luzzatto's other treatise, *Discourse on the Jews of Venice* (1638).

Impact and Legacy

The impact some libertines had on contemporary and posterior readers can be studied through the example of Paolo Sarpi. His prohibited *History of the Council of Trent* (London 1619) defends a free press and a separation between Church and State: despite its prohibition, its impact on Reformed Europe has been called “explosive” (Barbierato 2015). Sarpi had a considerable readership during the Seventeenth century: he was read, for example, by Thomas Hobbes, and from 1673 on, Arconati Lamberti and Gregorio Leti (Protestants who fled Italy) rekindled considerably the interest in Sarpi (Leti 1661–1662 and 1668; Infelise 2009). His thought inspired intellectuals and statesmen well beyond the Eighteenth century, as is illustrated through John Adams' famous citation in a letter to Thomas Jefferson. Metlica pointed out how the Italian libertines Pallavicino, Leti, and Marana influenced French Enlightenment authors (Montesquieu, Charles Guidon, Alain René Lesage) and how the libertine pamphlet announced the *conte philosophique* (Metlica 2011, 2013).

For the definition of libertinism, some see a Protestant-biased descent from the pamphleteer Gregorio Leti to Pierre Bayle. Leti left us *La strage dei riformati innocenti*, which was translated into French as *Le putanisme de Rome ou le conclave général des putains de cette cour* (1668). Others attribute an ancestry of the construction of libertine's image as object of controversy to the work of the Jesuit François Garasse, *La Doctrine curieuse des beaux esprits de ce temps, ou prétendus tels* (1623; see Moreau 2007).

Cavaillé (2007) emphasizes modern scholarship's impossibility to subtract itself from libertinism's polemical quintessence. He analyzed the nineteenth-century bias that spilled over well into

the twentieth century. In fact, for his appreciation of libertinage and libertinism, Pintard weighed heavily on his nineteenth-century precursors, the first to take up the topic of libertinism as a historiographical category. But they did so with a teleological aim: to prove this seventeenth-century movement as precursory to the Enlightenment, they judged negatively the (seemingly) ambivalence of those libertines who rejected religion and political authority while being infatuated or otherwise involved with religious topics and political institutions.

Over half a century after Pintard, Sergio Zoli (1997) produced a henceforth-indispensable guide to sources on sixteenth- and seventeenth-century libertine Europe for those working on movements of freethinking of this period. Besides offering a deconstruction of different historiographical approaches that became too entangled and enmeshed with moral thought, Cavaillé (2019a, b) still contributes to the field with a bibliography on the topic from Zoli (1997) until the present day.
